The *rod* must be long or short, stiff or supple, to suit the habits of different species of fish; thus, a long rod of sixteen or eighteen feet, very strong, but not very elastic. is necessary for salmon; while a rod of ten or fourteen feet, light, elastic, and finely tapering, is sufficient for trout. The rod for trout and similar kinds of fishing should be light enough to be wielded easily for several hours together by one hand. Spliced rods are easier mended than those with joints, and do not so readily get out of order. For salmon and other kinds of large fish, a large rod of several pieces, united by joints, is necessary.

The *reel* or *pirn*—an apparatus fixed near the bottom of the rod, and upon which the line is wound—should be simple in its mechanism, and made so as to wind or unwind freely and quickly.

Lines should be long, smooth, and flexible, and of a material not easily injured by wet. The part of the line which is wound upon the reel, and passes along the rod, is called the *reel-line;* that which is attached to it, is called the *casting-line*. The casting-line is usually made of triple gut, twisted, and between it and the gut to which the hooks are attached. there should be several threads of strong single gut. Reel-lines vary from twenty to one hundred and twenty yards in length, according to the dimensions of the water to be fished, and the habits of the species to be captured. Lines are made of various materials, such as horse hair and oiled silk. If, in purchasing, the angler be at a loss to decide between a heavy or a light line, he should incline rather to the heavy, for the sake of its *casting* superiority, and the advantage gained in windy weather. The *casting-line* is sometimes made of horsehair, lighter and finer than the reel-line, and at the end of this is attached the *gut-line*—the finest of all. Sometimes, however, the horsehair casting-line is dispensed with. The casting and gut lines should taper in thickness from the reel-line to the end hook on the gut-line; all knots should be small, but *secure*, the only breaks discernible by a general glance throughout the entire length of casting and gut lines, being the hooks.

Hooks range in size from several inches down to a quarter of an inch in length. Their chief places of manufacture are Kendal and Redditch.

Baits consist of any substance put upon a hook to act as a lure to the fish; and when used, the baited hook is dropped into, and allowed to sink in the water, instead of being kept near the surface, as is the case with fly. The materials, living or dead, used for bait are very numerous, the principle kinds being worms, caddis-worms, pastes, maggots, minnows, artificial and natural, and various kinds of insects. The methods of using baits are extremely various, and in many cases rather complicated.

Artificial Flies, intended as they are to bear something like a resemblance to the actual live flies, are the most important lures used by the angler. The chief materials for dressing flies are cocks' hackles or other feathers, to form wings; the fur of a hare's ear, mouse, water-rat, or some other animal, to form the body; and waxed silk thread to tie the whole, in an artful, neat manner, to the shank of the hook.

The following is a list of trout-flies and spiders, with a supply of which the angler may pursue his 'meditative art' in almost any river or stream in Great Britain throughout the entire season; and it is almost needless to add, that the wood-cut below, though copied from two favorite flies and a spider, is intended as a guide to *size* rather than to pattern. Spiders are dressed, as they naturally exist, without wings.

Flies.—No. 1. Wings formed of feathers from the wing of the chaffinch, with a black hackle, tied with slate-colored silk.

2. Wings composed of woodcock or partridge feathers, and red hackle, tied with yellow silk.

3. Wings formed of the feathers of the corn bunting, with a red hackle wound round close to the head, tied with orange-colored silk.

4. Wings formed from the speckled feather of the teal, with a black hackle wound round close to the head, tied with brown silk. The same wing with a red hackle, tied with yellow silk, also makes a killing fly.

5. Wings from the feathers of the dotterel; body and hackle same as No. 2.

6. Wings from woodcock or corn bunting wing; body of hare's ear.

Spiders.—1. From the small feather of the dotterel wing tied with yellow silk thread.

2. From the small glistening feather taken from the outside of the shoulder of the starling's wing, tied with yellow silk thread.

3. From the neck-feathers of the hill-partridge, tied with yellow silk thread.

4. From the black hen-hackle, tied with small black silk thread.

5. From the blue hen-hackle, tied with yellow silk thread.

Flies. Spider.

6. From the small red cock-hackle, or the small feather of the landrail's wing, tied with yellow silk.

Of *salmon-flies*, the best two we know of are formed from the following materials:

'No. 1. Tail.—crest-feather from golden pheasant; tip—gold tinsel and orange silk, with two turns of ostrich herl; body composed of claret-colored pigs' wool and mohair mixed, with a little pigs' wool at the head, of a light-blue shade; wound with silver tinsel and dark-red hackle, with blue jay's feathers for shoulders; wings—from the teal-duck or widgeon, distinctly marked or barred; head—of black ostrich herl.

'No. 2. Tail—crest feather from golden pheasant; body composed of pigs' wool and mohair mixed, of a dark-cinnamon shade;

Salmon Flies.

wound with silver twist and dark-red hackle; shoulders composed of breast-feather of the argus pheasant; wings composed of golden pheasant tippet or neck feathers, distinctly marked teal, four fibres of blue and red macaw tail-feathers, with pairs of wings from the brown and black barred feathers of the peacock wing surmounting the whole; a blue feather from the kingfisher or blue chatterer on each side of the wings; feelers—from blue and buff macaw tail-feathers; head—black ostrich herl.'

Larger and more gaudily dressed hooks are necessary for some of the bigger rivers of Great Britain, such as the Shannon in Ireland, and the Tay in Scotland; but the two here described are the most killing varieties for general use that we know of, and have been found more or less serviceable in every salmon river of any importance. No. 1 may be varied by different shades of wing, to suit various colors and sizes of water. Both are stock-flies with every tackle-maker.

The angler's equipment is completed by the addition of a *basket* or *bag* for holding his fish, and a *tackle-book;* also a flat, round tin box for holding his fly-casts. In fishing for perch, gudgeons, bream, &c., a small float is often used. Floats are made of cork, quill, reed, and other light materials; and a choice, according to circumstances, may be added to the tackle-book. Books adapted for the angler's purpose can be had of any tackle-maker.

The angler's dress should be a plain, dull-colored suit; his shoes strong; and if he prefers wading, his boots or leggings should be waterproof.

The *gaff* and *landing-net* are each useful for securing large fish when stranded in very shallow water, or when fishing from a boat; and the *drag-hook*, which is an instrument with three bent prongs or hooks, with a long strong line attached, is frequently useful for casting into rivers or lochs to clear away any object at the bottom on which the hook has fouled.

PRACTICE OF ANGLING.—*Bait-fishing*—As a rule, bait-fishing is practised more on sluggish, deep rivers than on swift running streams, though it answers as well, and, under certain circumstances, even better in the latter than in the former. The fish usually sought for in the slow-running, deep rivers south of the

Tweed, are gudgeon, roach, dace, bream, chub, barbel, tench, carp, perch, pike, trout, &c. All are sometimes taken with fly; but worms, gentles, or paste are more generally used.

The first thing the bait-fisher has to learn, is the art of baiting his hooks. Taking the hook in his right hand, and the bait between his fingers in the left, let him enter the hook at the head of the worm, and carry it through the animal to near the tail, covering the entire hook and its tying. The worm should be broken or mangled as little as possible; and the more life-like it appears, the greater the probability of its proving an effectual lure. There must not, however, be too much spare worm left dangling from the hook, otherwise the fish will keep nibbling it away without biting at the bait bodily, and taking it into its mouth—the thing which the angler desires.

In throwing the line with bait, take care not to splash the water, but throw forward and upward, so as to let the bait fall gently on the surface, and sink slowly in the water to the required depth. The motion of the line down the stream must then be carefully followed and watched.

Occasionally, the angler will *feel* a nibble, but he must not be in a hurry to *strike*—that is, to fix the hook in the fish's mouth. Perhaps it is no more than a nibble, and it is well to allow the fish time to bolt the hook. If drawn too quickly, you may actually pull away the hook after it is half-gulped. Experience and dexterity are required in this ticklish part of the craft.

In May the creeper, or stone-fly in its embryo state, is a deadly bait; and in June, when it assumes the winged state, it is the most killing bait that can be used. The creepers are mostly found under large stones in the water, the flies under large stones in the dry channel at the edge of the water. On Tweedside this fly is frequently but erroneously called the May-fly, and is productive of large takes of trout when other lures are comparatively useless. Minnows and parr-tail are two important baits; tackle is made on purpose for these, and consists of several hooks tied within an inch or so of each other. These are inserted in the minnow, so as to give a curving form to the bait, for the purpose of making it *spin* in the water; swivels are attached to the tackle further up, to prevent the line from twisting with the spinning of the minnow. Stoddart says: 'Fish in rapid streams, also in deep discolored pools, and during a smart curl. Manage the minnow as you would your fly, throwing it down and across as far as you are able; bring it towards you about six inches below the surface, spinning rapidly by the aid of several swivels. When a fish rises, give him time before you strike; let him turn and gorge the bait, then strike sharply, and he is yours.' This mode of fishing requires more dexterity and practice than ordinary bait-fishing, and will be best learned by carefully watching the motions of an experienced hand.

Fly-fishing.—This is the true A., all other kinds being tame in compariso . Trout and salmon are the fly-fisher's chief objects of desire; and here we will quote some remarks of Mr. Stoddart's upon the method of capturing the former of these fish with the lure in question: 'Your rod and tackle being ready, the wind in your favor down the river, draw out with your left hand a few yards of line from your reel, dip the top of your rod in the water, and with a rapid jerk you will lengthen as you wish that part you intend for throwing. A thirteen-foot wand will cast from six to seven fathoms of line. With a large double-handed rod you may manage a much greater length. Always, if you can, angle from a distance. Trout see you when you least imagine, and skulk off without your notice.

'All jerks in casting, are apt to whip off your hooks or crack your gut. A fly-fisher may use two, three, or four flies on his casts, according to pleasure. When angling with small hooks, we adopt the medium number. Large ones ought to be fished with in pairs, and well separated. In throwing the cast, lowermost or trail-fly should be made to alight foremost; its fall ought to be almost imperceptible; it should come down in the water like a gossamer followed by the droppers. The moment a fly touches the surface, it is ten times more apt to raise a fish than during the act of drawing it along. At no time are we stanch advocates for the system of leading our hooks either against or across a stream; our method is rather to shake them over it for a moment, and then repeat the throw. A trout will discover your fly at the distance of several yards, if feeding, and will dart at it like lightning.

'Trout will sometimes take in the most unlikely weathers, so that the angler should not despair at any time. Hunger causes them to feed at least once in the twenty-four hours, and generally much oftener. If the wind blows down the river, commence at the pool-head, and fish every inch of good water; you may pass over the very rough and very shallow parts, also those which are absolutely dead calm and clear, unless you see fish rising in them, when, should your tackle be light, there is no harm in taking a throw or two. Dead water, however, when rippled or discolored, may be angled in with great success.'

The following remarks and hints apply chiefly to trout-fishing in streams, and may be found of service to those who follow that delightful recreation. As a rule, fish *up*, especially when the water is clear, and the wind not directly down-stream; the advantages are, that the fish do not so readily detect the presence of the angler—their heads being directed up the water; they are more easily hooked; and when a large trout is hooked, he may be landed down-stream, thus saving the water above for further operations. The practice of angling up-stream is somewhat difficult at first, but a little practice works wonders, and is sure to bring its reward ultimately. Gut should be *round, clear, strong* and *fine;* the finer it is, consistent with strength, the better, as it scares fewer fish than coarser material. Trout-flies for ordinary use in rivers such as Tweed, &c., should be dressed rather sparely, and should be small; some half-dozen varities, such as those already enumerated, will be found amply sufficient; and were we asked to choose three kinds as being more valuable than any others, our choice would incline to a red hackle, a black hackle, and a woodcock wing dressed with hare-ear body.

For turbid or dark water, however, the size may be increased, and the dressing be made rather gaudier by the addition of tinsel. Practise casting till you can throw your flies like gossamer on the water, and, above all, avoid splashing. The use of a short line will give you great advantage over your tackle. Heavy fish hook themselves in nine out of ten cases, so that striking is unnecessary; striking is performed by a motion of the wrist, not of the arm, and is only to be learned by practice; it then comes quite naturally to the angler. Cast *frequently;* you get over more ground, and vastly increase your chances of success. Trout generally seize the fly the instant it lights on the water, or the instant after; hence, it is necessary that the angler be on the *qui vive in time.* Cast above where fish are likely to lie, and remember that the greater part of your success lies in the art of *keeping out of their sight.* Dull-colored clothes materially assist in achieving this important desideratum.

When fishing with a friend, always come to a distinct agreement, before starting, relative to the division of the water, especially if the stream be small.

The true angler returns all smoults, parr, and small trout to their native element—his maxim being quality, not quantity. He also keeps his rod well varnished, dries his line and tackle after using, and looks into his tackle-book at least once every three months during the non-A. season; he thus saves his flies from the ravages of the moth. The tyro should always be guided in his selection of a rod and tackle by some experienced friend; and upon arriving at strange angling quarters, he should place himself in the hands of a resident fisherman, who will guide him to the best casts of the river, loch, or stream. A day spent in watching the proceedings of an expert angler, is a day well spent; and a few hours' lessons in fly-busking, knot-tying, &c., work wonders. And, lastly, let the angler practise courtesy towards all his brethren of the rod, and be ever willing to lend a killing-fly to a needy friend.

The principal works on A. are Izaak Walton, Stoddart's *Angler's Companion*, the article A. in the *Encyclopædia Britannica*, Davy's *Salmonia*, the angling section of Colquhoun's *Moor and the Loch*, Dryden's *Hints to Anglers*, the angling section in Stonehenge's *British Rural Sports*, Francis's *Book on Angling*, and Stewart's *Practical Angler*. The copious literature of the subject will be found in Lambert's *Angling Literature in England*.

A'NGLO-CA'THOLIC CHURCH, or ANGLICAN CHURCH, a term frequently employed to designate collectively those churches which embrace the principles of the English Reformation. The following are, in brief, the views generally entertained of those principles by the members of the churches in question: By referring the Anglo-catholic Church to the English Reformation, it is not meant that her origin dates from that event, but that her tenets, as she now exists, are those which the Reformation cleared of what she holds to be corruptions. For, as the word 'church' itself suggests—being derived, like 'kirk' in Scotland, from the Greek adjective *kuriakë*, which means '*the Lord's*' (i. e. *house*)—the origin of the Anglican Church is to be traced not to a Roman but to an Eastern source. She claims the name of Catholic—which also is from the Greek *katholikë*, universal—because she is united, in origin, in doctrine, and in form of government, with the Universal Church as it has existed, with various differences of rites and ceremonies, in all countries and in all ages. Eusebius even asserts that some of the apostles passed over into Britain. Tertullian, who lived in the 2d c., speaks of places in Britain which, though inaccessible to the Romans, were subject to Christ: 'Britannorum inaccessa Romanis loca, Christo vero subdita.' At the Council of Arles, 314 A.D., there were three British bishops present; and St. Alban suffered martyrdom, under Diocletian, about the close of the 3d c., or nearly three centuries before the landing of St. Augustine (q. v.) and his missionaries, 596 A.D. Christianity, however, was driven by the heathen Saxons into the mountainous districts of Wales; and though Augustine, on his arrival, found no less than seven bishops and one archbishop in those parts, and though Bertha, queen of Ethelbert, was a Christian, yet the whole Saxon part of the country was in a state of heathenism. The British Church differed from the Roman and

other Western Churches, as to the form of administering baptism, and the time of keeping the festival of Easter (see EASTER), following the customs of the Greek or Eastern Church; and it was not until the close of the 7th c., under Theodore, that the two churches became united. In the meantime, the conversion of Britain was as much due to the labors of St. Aidan, the Scottish Bishop of Lindisfern in the north, and of St. Chad, the Saxon saint, as to the missionaries of the Roman Church in the south. See ANGLO-SAXONS.

Nor is this glance at the history of the Anglican Church, in the earlier period of her existence, unimportant, when we come to consider what and whence are her present form and tenets. From the beginning of the 8th to the middle of the 16th c., she became gradually, and at last completely, assimilated in doctrine and practice to the Church of Rome, as well as subject to her domination; and the fact of her having at length freed herself from both, is in no small degree due to her having existed, in Saxon times, in a state of freedom and purity. It required, as we have seen, a struggle of nearly a century to make the British Church conform to the Roman in the matters of baptism and Easter; and it was the same spirit which offered a strenuous, and for some time an effectual, resistance to the peculiar doctrines of the Church of Rome and the claims of papal dominion. There were always found individuals, some of great eminence, to protest against the former, whilst large sections of the church never ceased to protest against the latter. For a hundred and fifty years previous to the Reformation, the doctrines of Wickliffe were leavening the body of the Anglican Church. The overthrow of the papal supremacy was indeed effected by Henry VIII.; but that monarch rather hindered than favored the reformation of *doctrine*, as appeared from the rapid progress which it made when Edward VI. came to the throne. The bloody reign of Mary interposed a check to further progress; and it was not till the accession of Queen Elizabeth that the principles of the Reformation finally triumphed, and the Anglo-catholic Church assumed the form in which she has since continued to exist. During the period of more than 800 years preceding the Reformation, she became gradually, and at length completely, merged in the Roman Catholic; at the Reformation, she may be said to have emerged; when Rome, at the Council of Trent, anathematized all who would not receive her articles, the separation became final, and the positions of the two churches with respect to each other irreconcilably hostile.

The doctrines of the Anglican Church are to be found in the *Book of Common Prayer* (q. v.), which is based upon the second prayer-book of Edward VI., and was settled in its present form 1662 A.D. Her tenets are more *legally* defined in the Thirty-nine Articles, which were settled 1562 A.D. (see ARTICLES THIRTY-NINE). As distinguished from Rome, she rejects tradition as a rule of faith, though admitting it as to rites and ceremonies, and bases all her teachings upon the books of the Old and New Testaments, rejecting from them as apocryphal certain which Rome receives as canonical. She recognizes only two sacraments, Baptism and the Lord's Supper, whereas Rome allows five others—namely Confirmation, Orders, Penance, Matrimony, and Extreme Unction; she denies the doctrines of transubstantiation and the propitiatory sacrifice of the mass; she forbids what Rome practises—the adoration of the Virgin, saints, and angels, and the reverence of relics and images; she also denies the Roman doctrines of purgatory and the spiritual supremacy of the pope. It is not, however, to be forgotten that a great part of her liturgy is derived from the missals of the Roman Church. As distinguished from the Presbyterian Churches—e. g., that of Scotland—she is Episcopal, and holds the unbroken succession of her orders from the apostles, as one of her most esteemed privileges; whereas the Presbyterians, especially in Scotland, reject prelacy as a remnant of popery. These do not, however, differ from her materially in essential matters of faith, but chiefly as to the sacraments, the form of administering them, and the grace conveyed in them; as to the observance of seasons, such as Christmas, Lent, Easter; and as to the forms of public worship, the Presbyterians using no set forms. Her differences with the Greek Catholics are less wide than with the Roman, and will be best seen by referring to the article GREEK CHURCH. From the Lutherans she differs on the doctrine of consubstantiation in the sacrament of the Lord's Supper. From the Calvinists she differs radically as to the extent of the efficacy of Christ's death, they believing only in 'particular,' she in 'universal,' redemption (meaning, of course, not that all men will actually be saved, but that Christ died for all); nevertheless, some of her articles, as the 17th, are decidedly Calvinistic. The numerous sects of Wesleyans, Baptists, and Independents do not differ from her on what they themselves consider essential articles of faith, but chiefly as to the necessity of orders, the grace conveyed in the sacraments, and the forms of public worship and of church government. But since their separation from her, endless varieties of doctrine and worship have spread among them. Unfortunately, there remains no Gallo-catholic Church with which to compare her.

The Anglo-catholic Church embraces the Church of England, the Protestant Episcopal Church in Ireland, the Episcopal Church in Scotland, all the colonial and the American Episcopal Churches. All but the latter use the English *Book of Common Prayer;* in America this has been slightly altered. The American Church is one of the most flourishing offshoots of the Anglican. It was planted in Virginia, 1607 A.D., but, for nearly two centuries, the mother church in England withheld from her offspring the necessary boon of an episcopacy of her own. It was not till the close of the 18th c. that the first three American bishops were ordained (one by the Scottish bishops in 1784, and two by the archbishop of Canterbury and the bishops of Bath and Peterborough in 1787); but now this branch of Anglo-catholicism has spread over the greater part of the United States.

ANGLOMA'NIA designates, among the French and Germans, a weak imitation of English manners, customs, &c., or an indiscriminate admiration of English institutions. In German literature, an A. was especially prevalent in the 18th c., when translations of English books became numerous, and were read with great admiration. The Germans have ascribed the sentimental and affected style of some parts of their literature to the influence of the English literature of last century. But the A. was harmless in comparison with the GALLOMANIA, or imitation of French literature and customs, which prevailed in the time of Frederick II. of Prussia, and was developed in the writings of Wieland. A remarkable A. prevailed in France for some time before the commencement of the Revolution. It arose out of political considerations and admiration of English free institutions, but extended to trifles even of fashions and manners, and often became very ridiculous.

A'NGLO-SA'XON LANGUAGE AND LITERATURE. The term Anglo-Saxon is of quite modern origin, the ruling race in England before the Norman conquest, not known itself by any other name than Æ̂nglise or English. Mr. Freeman, Professor Stubbs, and other able scholars of the present day, argue stoutly for a return to the old and true name; and to all appearance the abolition of 'Anglo-Saxon' and the restoration of 'English' is only a question of time. English is one of the Low German family of Teutonic languages. We do not know it in its earliest form. Some centuries elapse after the invasions of the 5th century, before any literature was produced or recorded. During this time, the dialectic differences of the various Low German tribes who had come into the island were probably diminishing, while separation from their kinsmen on the continent must on the other hand have tended to develop new peculiarities. The result is, that the very oldest English is by no means the same as the very oldest dialects of Low German in the coast regions between the Rhine and the Baltic.

But it most nearly resembles the old Saxon of Rhenish Prussia and Westphalia, and the old Dutch and the old Frisian of the provinces of Holland, and to the last of these it has the closest affinity. It is not to be supposed, however, that at any time before 1066, Englishmen spoke or even wrote a single dialect. There is evidence of at least two being used—a northern and a southern—an Anglian by the people of Northumbria, and a Saxon by the people of Wessex. The former is the more primitive, and as Mr. Kington-Oliphant points out (*Sources of Standard English*, 1873, pp. 35—40), has more in common with old Norse and Frisian than its southern sister; e. g., the infinitive ends not in the *an* of Wessex English, but in *a*. The history of England during the six hundred years before the Norman conquest accounts both for the antiquity of the Northumbrian literature, and for the subsequent triumph of the Wessex dialect. In the 7th and 8th centuries, Northumbria was the strongest, the most civilized, and the most learned of the English states. Christianity had poured its benign influences over it in double measure. Paulinus and Aidan, Rome and Iona, had both striven successfully against paganism, and light flowed over the land. Cadmon and Bede and Alcuin were all Northumbrians. That so little of this Northumbrian literature has come down to us is owing to the destruction of the northern monasteries by the Danes. The influence of Alfred, 'king of the West-Saxons,' and the unification of government in the island under his successors, gave the dialect of Wessex an irresistible supremacy; so much so, that even most of the early northern literature only survives in a southern dress—e. g., we can only read Cadmon in a Wessex version of the 10th c. Yet, so strong was the impression left on its neighbor by the Anglian state, that not even the havoc made by the Danes of its literary monuments and its political prosperity could prevent its name from being given to the island, the people, and the tongue.

Wessex English, then—that is, the English of the court, of books, and probably in great measure of the schools, prevailed in England for more than 150 years before the Norman conquest, and is substantially what we mean when we speak of the 'Anglo-Saxon' language. There is no reason to suppose that it ever superseded the dialect of the north for ordinary purposes of inter-

course. Anglian lived on in the mouths of the people, and in later times has won an immortal fame in literature under the name of Lowland Scotch. Cadmon and Burns both used it, though in the unapproachable verse of the Ayrshire bard it has become utterly inorganic, and so remains. English, then, before the Conquest, differs from modern English in being an inflected language. Its inflections are not so rich, or various, or euphonious as those of Latin, or Greek, or Mœso-Gothic, that oldest and noblest of the Low-German dialects; but they are still sufficient to give it a distinct character, and to make it strange and almost unintelligible at first sight to one whose reading does not go back beyond Shakspeare.

Its nouns can be grouped into declensions, and classified according to gender, and faint traces of the terminations are preserved in the English of the present day. The *en* in 'children' and 'oxen' is the old *an* of the plural in nouns of the first declension; the *s* and *es*, the old *as* marking the plural of masculines of the third. Adjectives have both a definite and indefinite form. The article is as complete as in Greek, though everything has now vanished but a fragment of the neuter *thæt* (modern *the*). Some mutilated remains of the pronominal inflections still survive to puzzle school-boys, and delight the lovers of 'hoar antiquity.' Verbs are divided into 'strong' and 'weak' conjugations, as is still the case in German. The distinction between the indicative and subjective moods, though slight, is real; and we have not only an infinitive in *an*, but a gerund in *enne*, while the present participle in *ende* is not confused with the verbal noun in *ung*, as is unhappily the case with us who have made *ing* do duty for both. Of late years the study of the English tongue, particularly in its earliest stage, has become almost popular, and grammatical works are now numerous. Besides the fragmentary or discursive contributions to the subject of English grammar by Guest, Madden, Garnet, Grimm, Earle, Morris, Kington-Oliphant, we may specify Rask's *Angelsäksisk Sproglaere* (Stockh. 1817, with Thorp's translations of 1865); Marsh's *Lectures on the English Language* (1861); Koch's *Historische Grammatik der Englischen Sprache* (1863—1869); Mätzner's *Englische Grammatik* (1865); Latham's *English Language* (1855); March's *Comparative Grammar of the Anglo-Saxon Language* (1870); and Sweet's *Anglo-Saxon Reader* (1877).

Having thus indicated very briefly some of the salient features of English as it was spoken and written before the Conquest, we proceed to make a rapid survey of the contemporary literature. From what has been said above, one will naturally look to the north for the earliest examples. The *Runes* graven upon the Ruthwell's Cross, which was set up about 680 A.D., are now proved from the inscription itself to be the composition of Cadmon, and are the very oldest relic of Anglian poetry. Here we find Cadmon speaking his own speech, not, as in his other poems, speaking to us through a Wessex version. Other and later monuments of Northumbrian English are a *Psalter* (800 A.D.); the *Rushworth Gospels* (900 A. D.); the *Lindisfarne Gospels* (970 A. D.). But the great body of this early literature, whether produced in Northumbria, or Mercia, or Wessex, has come down to us only in the dialect of the last of these states; therefore, in referring to it, we shall consider, not the antiquity of the MS., but of the author. A good deal of it is poetical. The verse is alliterative, as in the Norse and in the oldest German poetry; and only in some of the later poems do we find a beginning of rhyme. The epic or narrative poems are remarkable for superabundance of often-recurring epithets, bold metaphors, and a certain pomp and magnificence of style. Of the genuine heroic poetry, however, there are few remains, the principal one being the poem of *Beowulf* (q. v.), a work which must have been composed before the Angles and Saxons quitted their original seats on the continent.

Other pieces produced in Germany, though only surviving in an English form, are the *Traveller's Song* and the *Battle of Finsburgh*. The introduction of Christianity gave a religious character to Anglo-Saxon poetry; and many narrative poems are extant on religious subjects, some of which may be seen in the *Codex Oxoniensis*, a collection edited by Thorpe (Lond. 1842). The *Song of Cadmon* (see CÆDMON), which is preserved in Alfred's translation of Bede, has been edited both by Junius and Thorpe; and a metrical paraphrase of parts of the Holy Scriptures, ascribed to the same author, has found editors in Thorpe (1832), Bouterwek (1847—1854), Grein (1858). Cadmon is said by Bede to have died about 680, so that both of the works in question must belong to the 7th c. Two poems from the *codex* which Dr. Blum discovered at Vercelli in 1832, have been edited by Jacob Grimm (Cassel, 1840), under the title of *Andreas und Elene;* a poetical calendar of the saints by Fox (Lond. 1830); and a version of the Psalms by Thorpe (Lond. 1835). Among the most important prose works must be mentioned the laws, civil and ecclesiastical, from the time of Ethelbert of Kent to that of Canute, of which the best edition is in Thorpe's *Ancient Laws and Institutes of England* (Lond. 1840). Of historical works may be mentioned Alfred's translations of Orosius and Bede; and the *Chronicle* carried on by different hands to 1154, of which the best edition, down at least to the Conquest, is Price's, in the *Monumenta Historica Britannica*, 1848, an earlier one being that of Ingram (Lond. 1823). It is in the province of theology that English literature before the Conquest is most rich, abounding particularly in legends and homilies. A collection of homilies made by Bishop Ælfric has been published by the Elfric Society (2 vols., Lond. 1847), a society instituted in 1843 for the promotion of the knowledge of the England and English language of those times. Ælfric did much to enrich it with translations, and began a translation of the Bible. He translated the first seven books, the book of Job, and the apocryphal Gospel of Nicodemus, and also a fragment of a poem on the history of Judith, of great celebrity (Oxf. 1698). The *Durham Book*, or St. Cuthbert's book, a very famous manuscript, now in the British Museum, contains an interlinear gloss of the gospels in the East-Anglian dialect, the text being probably of the 8th, and the gloss of the 10th c. Alfred translated the work of Boethius, *De Consolatione Philosophiæ*. The opinions of Englishmen before the Conquest on astronomy, natural philosophy, and medicine, are exhibited from their works by Wright in his *Treatises on Sciences written during the Middle Ages* (Lond. 1841), and Turner's *History of the Anglo-Saxons* (3 vols., 7th ed. 1852). Compare also Thorpe's *Analecta Anglo-Saxonica;* Marsh's *Origin and History of the English Language and the Early Literature it embodies* (1862); and Grein's *Bibliothek der Angelsächsischen Poesie* (1857–61), and his *Bibl. d. Angels. Prosa* (1864). See ENGLISH LANGUAGE.

ANGLO-SAXONS, the collective name generally given by historians to the various Teutonic or German tribes which settled in England, chiefly in the 5th c., and founded the kingdoms of the Heptarchy. They consisted for the most part of Angles, Saxons, and Jutes. The generally received opinion is, that the first of these invaders made their appearance in Britian in 449, having Hengest and Horsa as their leaders. But under the more searching scrutiny of later writers, these famous leaders have evaporated into mythical heroes of romance, common to most of the Germanic nations; and though the fact of a great Germanic invasion in the middle of the 5th c. is not doubted, it is believed that this was by no means the earliest period at which Germanic settlements were effected in England. Long previous to this period, a portion of the coast, extending from Portsmouth to Wells in Norfolk, was known as the *Littus Saxonicum;* but whether in reference to Saxons by whom it was settled, or to roving adventurers of that race by whom it was ravaged, is still a subject of dispute. Of the three tribes mentioned above, the Jutes are believed to have been the first comers. Their original settlements were in what is now the district of Schleswig; and the portions of England of which they possessed themselves were Kent, the Isle of Wight, and the opposite coast of Hampshire. The Saxons, who were the next invaders, settled chiefly in the southern and central parts of England—in Sussex, Essex, Middlesex, the south of Hertford, Surrey, the part of Hampshire not possessed by the Jutes, Berks, Wilts, Dorset, Somerset, Devon, and the portion of Cornwall which did not remain in the possession of its former Celtic inhabitants. The Saxons who invaded England probably belong chiefly to the portion of that great nation, or confederacy of nations, whose territories lay on the shores of the Baltic—occupying what are now the district of Holstein, the north of Hanover, and the west of Meeklenburg. The third tribe, whose name and nationality afterwards prevailed over the others—the Angles—did not arrive till a somewhat later period. Coming like the Jutes from the district of Schleswig, a corner of which is still called Angeln, they made, from 527 to 547, a succession of descents on the coasts of Suffolk and Norfolk, and latterly, on the country to the north of the Humber, and the southern part of Scotland between the Tweed and the Forth. Eventually, the Angles obtained possession of the whole of England, except the portions already mentioned; that is to say, of all the part to the north of the Avon, on the one side, and the Thames on the other—Essex, Middlesex, and part of Hertford excepted. The union of different bands of these conquerors amongst themselves, with their countrymen who had preceded them, and with the Celtic population which, though conquered, there is no reason to suppose was exterminated, gave rise to the so-called Heptarchy (q. v.)—the kingdoms of Northumbria (originally Bernicia and Deira), Kent, Sussex, Wessex, Essex, East Anglia, and Mercia.

The various independent states into which England had till then been divided, were united by Egbert, king of Wessex, in 827, into the one kingdom of England (the land of the Angles). The royal family of Wessex, which was thus raised to what, for the first time, probably, is entitled to be called the kingly dignity, never again lost its supremacy, except, indeed, during the Danish period (1017 to 1042), till the Norman Conquest; and to it Alfred the Great (q. v.) belonged.

The English constitution, the origin of which is sometimes ascribed to Alfred (849—901), was not framed by him, though he restored it and improved it after the deliverance of the country from the Danes. It was essentially the same as that of other Germanic nations. At the head of the government was the *cyning* or *cyng-*

The kingly office, among the Germanic nations in early times, had reference solely to the tribes or peoples governed, and never to the land which they occupied. During this period, it was naturally elective; but after the idea of great territorial possessions came to be inseparable from it, it became hereditary, though a form of election, or color of ascertaining the national will, was still retained. The life of the king, like that of every other man, was assessed at a fixed price (*Weregild*, q. v.), which was that of an *æthel-ing*, or person of royal blood, with a sum superadded as the price of his royalty. The first of these sums went to his family, the second to the people. The king possessed the power of calling together the Witenagemôt (q. v.), and of laying before them propositions for the public weal; but he had not the power of dismissing the assembly, so that in England, from the first, the real center of power seems to have been in parliament. Neither was the convocation of the Witenagemôt at the option of the sovereign, for there is every reason to believe that his power was all along limited by the necessity of consulting the principal members both of the clergy and laity of the kingdom; nor, it would seem, could he impose taxes, or declare peace or war, without their consent. The sons and other near relations of the king constituted an aristocracy of birth, called ethelings or æthelings (the same word with the German *Adel*, noble). Out of the great officers of the state, or immediate servants of the king, was gradually formed a hereditary aristocracy, closely corresponding to that which subsequently existed in feudal times. Of these, the person next in rank to the king was the *ealdorman* ('elderman,' Lat. 'senator') or *heretoga* ('army-leader'). But inasmuch as the ducal functions, in the Anglo-Saxon polity, were by no means confined to service in the field, the peculiar title of heretoga is very rarely met with, being for the most part replaced by ealdorman or aldorman, which denotes civil as well as military pre-eminence' (Kemble, *ut sup.* ii. 126). Though the word is derived from an adjective signifying age, in practice, no such meaning attached to it, more than to senior, which is the original form of the word seigneur.

It was to the same class of officials that subsequently the Danish title of *eorl* or earl came to be applied. The powers of these officers probably varied in the different kingdoms, whilst they remained separated; but we shall form, on the whole, a pretty accurate conception of the position of the ealdorman, if we regard him as the governor of the *gá* or shire, the *scirgerefa* or sheriff being his deputy. Much difference of opinion exists as to the rank and position, social and political, of the thane; and all that can be said with confidence is, that before the Conquest, it was not convertible with ealdorman, or equivalent to baron, as it came to be after the Conquest. The office seems to have implied subordinate landed tenure, similar to that by which the lands of the vassal were held of the lord in feudal times; and thus, whilst the king's thanes were frequently ealdormen, these, in their turn, had thanes of a lower rank, who appear to have been very numerous. This view is strengthened by the derivation of the term from *thegnian* or *thenian*, to serve, which is the same word as the modern German *dienen*, and from the fact of its frequently being translated *minister* in the Latin charters of pre-Norman times. The whole class of ordinary freemen or commoners were called *ceorls*, afterwards *churls* (a word preserved in the German *Kerl*, and in the lowland Scotch *carle*), and were generally associated under the protection of some person of rank and influence, who was called the *hlaford* (our 'lord,' but *lit.* 'bread-winner,' or rather 'bread beginner'). This, however, was in itself no recognized title, and up to a very late period the Anglo-Saxon laws knew no other distinction than that of ceorl and eorl. The Britons, who retained some degree of freedom, constituted a lower class, called *wealhas* or 'Welsh' (*lit.* 'foreigners,' as they seemed to the conquerors). The number of slaves (*theowas*) was not very great, nor does the character of the servitude imposed on them seem, comparatively speaking, to have been oppressive. Different rights and privileges belonged to the different ranks of the Saxon people, and, as we have already said, a different *Weregild* (q. v.), or pecuniary estimation, was fixed for each rank, as the penalty for homicide. The great districts or shires were subdivided into tithings (*teothunga*), each containing *ten* free heads of families, who were held mutually responsible for each other. Ten tithings formed a *hundred*, which had a court subordinate to the court of the shire. In important matters, the ealdorman of the shire could not decide without the concurrence of an assembly (*Scírgemôt*, Assembly of the Shire) of thanes of the shire and representatives of townships, which met half-yearly, and corresponded to the *Witenagemôt* (Assembly of the Wise), or *Micelgemôt* (Assembly of the Great) for the whole kingdom.

Christianity was introduced among the newcomers in the end of the 6th, or beginning of the 7th c. by St. Augustine, a missionary sent by Pope Gregory I., called the Great. Augustin became the first archbishop of Canterbury; and before the close of the 7th c., the whole of *Engla-land* was a Christian country under one metropolitan. Ethelbert, king of Kent, was the first sovereign who embraced the Christian doctrine.

Bringing with them the traditions and feelings of the empire, the whole influence of the clergy was thrown into the scale of monarchy, and greatly tended to its consolidation. A Christian church, however, already existed in Scotland and the north of England; and the influence of the Culdees (q. v.) long prevailed against the efforts of the southern prelates to establish uniformity of worship and complete conformity to Rome. But in truth, the English clergy in general were not very submissive to the authority of the popes, who did not succeed in reducing the land to complete subjection till after a long struggle. St. Dunstan (q. v.) gained for them their final victory in the 10th c. During the time of its comparative independence, the English Church was distinguished for the learning and laboriousness of its clergy. Bede (q. v.) is the most eminent author whom it produced. Between his time and that of Alfred, a very great degeneracy had taken place both in the learning and efficiency of the clergy, which that active and enlightened sovereign labored to restore, but only with partial success. St. Boniface (q. v.) and many other English and Scottish missionaries labored with success in the propagation of Christianity in Germany.—Besides the works already referred to, see Freeman's *History of the Norman Conquest*, and *Old-English History*, and Green's *Short History of the English People* (1875).

ANGO'LA, a name often applied to the whole of the West African coast from Cape Lopez de Gonsalvo in lat. 0° 44′ S., to San Felipe de Benguela in 12° 14′ S.; but, in a more restricted sense, the name of a kingdom in Lower Guinea dependent upon Portugal, and extending from the river Coanza on the south, in lat. 9° 20′ S., to the Danda on the north, in 8° 20′ S. The natives generally call it Donga. The interior is very imperfectly known, and the boundaries uncertain; but A. is supposed to contain about 250,000 inhabitants. The country being well watered, is covered with a most luxuriant vegetation. The heat being moderated by the sea-breeze, the orange and other fruits of the warmer temperate climates are produced, as well as those which are strictly tropical. There is a great abundance and variety of wild animals, and the mouths of the rivers swarm with sharks and crocodiles. The principle rivers are the Coanza and Danda. Much of the country is mountainous. The mountains are covered with forests, and are rich in metals, particularly copper, iron, and silver, which, with wax and ivory, are the principle legitimate exports, although the great trade, almost to the present day, has been in slaves. Fetichism is the prevailing superstition, and circumcision is general among the natives. A. might easily be rendered very productive, both of sugar and cotton, but the manner in which it has been governed by the Portuguese has not tended to develop its resources. They discovered it in 1486, and have had settlements in it since 1488; but the number of resident Portuguese is very small, and they are almost entirely confined to a few spots—forts and commercial establishments called *feiras* or fairs. The capital is Loando, or San Paulo de Loando (q. v.).

ANGON, a barbed spear used by many early nations. The Franks, in the 7th c., employed angons both for thrusting and hurling. The staves were armed with iron, so as to leave but little of the wood uncovered; the head had two barbs. When hurled or thrust at an opponent, the head of the A. became fixed in the flesh by means of the barbs. This form of spear was much adopted by the Anglo-Saxon and other Teutonic nations.

ANGO'RA, the Ancyra of the ancients, capital of the Turkish vilayet of the same name, in the mountainous interior of Asia Minor,

Angora Goats.

and distant from Constantinople about 220 miles east-south-east. It is said to have been built by Midas, the son of the Phrygian Gordius; was a flourishing city under the Persians; became the capital of the Gallic Tectosages, who settled in Asia Minor about 277 B. C.; was a principal seat of eastern trade under the Romans; and was made the capital of the Roman province of Galatia Prima. It was the seat of one of the early churches of Galatia, and the scene of two Christian councils held respectively in 314 and 358. A decisive battle between the Turks and Tatars was fought near

A. in 1402, in which Timur defeated and took prisoner the sultan Bajazet I. A temple of white marble was erected by the citizens of Ancyra to the Emperor Augustus, who had greatly beautified the city, and his deeds were recorded in inscriptions upon a number of tablets and the columns of an altar. These inscriptions, the *Monumentum Ancyranum*, discovered by Busberg in 1553, are important for the elucidation of ancient history. They were first printed in Schott's edition of Aurelius Victor (Antw. 1579), and have recently been edited with notes by Franz and Zumpt (Berl. 1845). The present A. is said to contain not more than 40,000 inhabitants, of whom one-third are Armenians. It is famous for its breed of goats, with beautiful silky hair, eight inches long. Of this goat-hair, a kind of yarn is made, known as *Turkish yarn* or *camel yarn*, and of which also a manufacture of *camlets* is extensively carried on in A. itself. Of the skin of the A. goat, the fine Oriental Morocco leather is made. Many of the animals in this region are characterized by the length and softness of their hair, especially the dogs, rabbits, cats, &c. This peculiarity seems to depend on the climate, and soon disappears in Europe. The A. goat is bred for its hair at the Cape, and is now the source of a large revenue. It has also been introduced into Victoria.

ANGORNOW′, or NGO′RNU, a town of Bornu, Central Africa, on the south-western bank of Lake Tchad, 15 miles south-east from Kukawa. The surrounding country is very level and monotonous, but fertile. The waters of Lake Tchad are usually some miles distant from the town, yet the whole intervening plain is sometimes covered with water, and the town in itself is liable to destructive inundations. It is a place of considerable commercial importance; the principal articles of trade are slaves, cotton, amber, coral, and metal. The pop. is supposed to be about 30,000.

ANGOSTU′RA, or CIUDAD BOLÍVAR, a seaport town of Venezuela, in lat. 8° 8′ N., and long. 63° 55′ W., on the right bank of the Orinoco, about 240 miles from its mouths. It is built at a point or pass (*angostura*), where, on both sides, the river is narrowed by rocks to a width of 3134 feet, after having measured three miles across at thrice the distance from the sea. The site of A. is only 191 feet above the sea-level—an elevation which, on the intermediate distance as above, yields an average of less than ten inches to the mile. In fact, the bottom of the river in front of the town is lower than the surface of the sea, for, even in the lowest state of the water, it is said to be 200 feet deep, with a margin for floods to the amount of fifty or sixty feet more. Under these circumstances, the bed of the stream must be about 250 feet under the level of the city, or about 60 feet under the level of the sea. When the river does rise to its highest, there are at least portions of the city inundated; and instances are believed to have occurred in which careless people were devoured by alligators in the very streets. Chiefly, as is supposed, through the free access of the trade-winds over the flat surface of the country, A. enjoys, in proportion to its latitude, a singularly temperate climate. Even in the hottest season of the year, the thermometer is said seldom to show more than 86° F.; while, between the beginning of November and the end of April, it ranges from 77° by day to 69° by night.

The situation of A. is highly favorable, in a commercial view. The basin of the Orinoco, which lies nearly all above the town, and is estimated to contain about 250,000 square miles, or more than twice the area of the British Isles, is particularly rich towards the north. On that side it reaches very nearly to the coast-line, so as to comprise some of the very best parts of Venezuela. Towards the south, again, it consists, in a great measure, of boundless plains, traversed by countless herds of cattle. Over the whole of this vast basin, and that almost equally in both directions, the main stream and its affluents are, with hardly any interruptions, navigable to near the foot of the mountains. Owing to the impetuosity of the currents and the obstruction of shoals, sailing-vessels are said to take fifteen days to sail up to A.; but with steam navigation these impediments would in great measure disappear.

With such advantages of position, A. was a flourishing mart before the commencement of the war of independence; but the civil broils materially interfered with its prosperity. As far back as 1807, A. had 8500 inhabitants; ere twenty years elapsed, the population had been reduced to little more than a third part of the number. According to later information, however, it was rapidly approaching its former amount.

ANGOSTURA BARK, or ANGUSTURA BARK, the aromatic bitter bark of certain trees the natural order *Rubiaceæ*, and tribe *Cuspariex*, natives of the tropical parts of South America. It derives its name from the town of Angostura, where it is a considerable article of commerce. It was first brought to England in 1778. It is used in medicine as a remedy for weakness of digestion, diarrhœa, dysentery, and fevers. It is tonic and stimulant. The most important of the trees producing it is the *Galipea officinalis*, which grows upon the mountains of Columbia and near the Orinoco. It is a tree of 12—20 feet high, and 3—5 feet in diameter, having a gray bark, trifoliate leaves, with oblong leaflets about ten inches long, which, when fresh, have the odor of tobacco, and flowers about an inch long, in racemes, white, hairy, and fragrant. The bark contains a chemical substance not yet sufficiently examined, called *Angosturin*, *Cusparin*, or *Galipein*, to which its medicinal efficacy is ascribed. It is supposed that a variety of A. B. is produced by *Galipea Cusparia* (called by some *Bonplandia trifoliata*), a majestic tree of 60—80 feet in height, with fragrant trifoliate leaves more than two feet long. A. B. is believed to be one of the most valuable of febrifuges; but its use is at present very limited, and has, indeed, in some countries of Europe, been prohibited, in consequence of its frequent adulteration with the poisonous bark of the *Strychnos Nux Vomica*, or the substitution of that bark for it. This poisonous bark is sometimes called *False A. B.* It differs from the true A. B. in having no smell, in its much greater weight and compactness, in its inner surface being incapable of separation into small laminæ, and in the effects which are produced upon it by acids and other tests, particularly in its outer crust being rendered dark-green, or blackish, by nitric acid, whilst that of the true A. B. is rendered slightly orange-red.

ANGOULEME, the capital of the department of Charente in France, and formerly of the province of Angoumois. It is situated on the Charente, and has narrow and crooked streets, a number of paper-mills, manufactures of woollen stuffs, linen, and earthenware, &c., and a population (1876) of 28,665. It possesses a royal college, a museum of natural history, and several other useful institutions. In the center of the town stands the remnant of the ancient castle of A., in which was born the celebrated Marguerite of Navarre, the authoress of the *Heptameron*, and other works. The railway from Paris to Bordeaux passes through it. Much saffron and wine are produced in the neighborhood. The province of Angoumois was in early times a county; but the heir of it, in the beginning of the 14th c., being an adherent of the English, Philip the Fair took possession of it, and it became an apanage of younger branches of the royal family. It was made a duchy by Francis I., and was sometimes bestowed upon natural sons of the French kings. Charles de Valois, Duke of A., a natural son of Charles IX., was a distinguished general in the reigns of Henry IV. and Louis XIII.

ANGOULEME, Louis Antoine de Bourbon, Duc d', the eldest son of Charles X. of France, and Dauphin during his father's reign, was born at Versailles on 6th August 1775. He retired from France along with his father at the commencement of the Revolution, and spent some time in military studies at Turin. In August 1792 he entered Germany at the head of a body of French emigrants; but the ill success of the campaign, and his own unfitness for military command, led to his seeking tranquillity along with his father at Edinburgh. Till 1814 he continued an exile from France, wandering from one place to another on the continent, and latterly resident with the other members of his family in England. On the entrance of the allies into France, he appeared at the British head-quarters at St. Jean de Luz, and thence issued a proclamation to the French army. He entered Bordeaux under protection of the British on 12th March, and made liberal promises in the name of his uncle, Louis XVIII., among which was that of complete religious liberty. He was again in the south when Napoleon returned from Elba. He was appointed lieutenant-general of the kingdom, and hastened with such forces as he could collect to oppose the emperor; but although he obtained some advantages at first, he was soon deserted by his troops, was for some days detained a prisoner, and at last sent away in a Swedish merchant-vessel to Barcelona. After the second restoration, he was sent by Louis XVIII. to the southern provinces to repress the political and religious movements there; and in 1823 he led the French army into Spain, to put an end to the constitution. A man of phlegmatic disposition and mean abilities, he was, in all political matters, a tool of the ultra-royalists and the priests. When the revolution took place in July 1830, he signed, along with his father, an abdication in favor of his nephew, the Duc de Bordeaux; and when the Chambers declared the family of Charles X. to have forfeited the throne, he accompanied him into exile to Holyrood, to Prague, and to Görz, where he died, 3d June 1844.

ANGOULEME, Marie-Therese-Charlotte, Duchesse d', the daughter of Louis XVI., was born at Versailles on 19th December 1778, and early displayed much quickness of intelligence and energy of character, with the most tender sympathy in the distresses of others. Having passed through the horrors of the Revolution, and endured a long imprisonment, she was exchanged, on 25th December 1795, for some French prisoners in the hands of the Austrians, and lived at Vienna till her marriage, in 1799, with her cousin, the Duke d'Angoulême, whose subsequent fortunes she shared. She survived him seven years, and died October 19, 1851.

ANGRA, the capital of the Azores, a seaport at the head of a deep bay on the south coast of the island of Terceira, lat. 38° 38′ N., long. 27° 14′ W. It is a station for ships between Portugal and Brazil and the East Indies; but the harbor is very much ex-

posed. It is the seat of the Portuguese governor-general of the Azores and of the bishop; is well built, but dirty; strongly fortified, and protected by a citadel at the foot of Monte de Brazil; contains a military college and arsenal, several scientific and literary societies, a cathedral and numerous churches; and (1878) 11,263 inhabitants. There is a considerable export of wine, cheese, honey, and flax. This city furnished an asylum for the Portuguese regency from 1830 till the taking of Oporto, in 1833, by Don Pedro.

A'NGRI, a town of south Italy, in the province of Salerno, and 17 miles north-west from Salerno, not far from the Naples and Nocera Railway. The surrounding country abounds in vineyards and cotton plantations. Pop. 6921.

ANGUILLA. See EEL.

ANGUILLA, or LITTLE SNAKE, one of the West India islands, so called, perhaps, from its long and narrow figure. Next to Anegada, it is the most northerly of the Lesser Antilles, lying almost due east of the eastern extremity of Porto Rico, in lat. 18½° N., and in long. 63°—64° W. It belongs to England, having an area of 35 square miles, and a population (1871) of 2773. It is low and wooded; but its cleared spots produce cotton, tobacco, and sugar. Its harbor, such as it is, is beset with reefs; but there is said to be good anchoring-ground in the channel between A. and the isle of St. Martin to the south.

ANGUIS. See BLIND-WORM.

A'NHALT, one of the oldest principalities of Germany, and now a state of the Germanic empire, is situated on the Elbe, the Mulde, and the Saale. It consisted formerly of three duchies—A.-Dessau, A.-Bernburg, and A.-Köthen. A. contains 896 sq. m. Pop. (1875) 213,689; (1880) 232,592. A. is almost entirely surrounded by the Prussian territories, which intermix with it and divide it into portions. Dessau, Zerbst, Bernburg, and Köthen are the principal towns. The country is level and fertile, producing wheat, flax, rape-seed, hops, and tobacco. Wine is produced on the Saale. Agriculture is the chief employment of the people, who are generally Protestants. Part of the former duchy of A.-Bernburg approaching the Harz Mountains possesses mineral wealth in iron and other mines. A. began to be an independent principality in the first half of the 13th c. It has been repeatedly, in the course of its history, divided amongst branches of the reigning family. The division into three duchies dates from the beginning of the 17th c. It was divided originally into four parts, but the line of A.-Zerbst has become extinct. The three duchies were independent of each other; but a family compact connected the reigning lines, which often led them to take public action conjointly. Some of the princes of A. have been eminent in the political, military, and ecclesiastical history of Germany.

ANHY'DRIDES is the term now commonly given to the compounds formerly known as anhydrous acids, which was a very unsatisfactory name, seeing that these bodies do not present any of the ordinary properties of acids. In some cases, they are the result of the dehydration of acids, and in all cases they represent in their composition the acid *minus* water. One of the most eminent French chemists, Professor Wurtz, lays down the following general principles: '(1) The anhydrides of monobasic acids (*a*) contain the elements of two molecules of a monobasic acid, *minus* one molecule (which corresponds with two atoms) of water; (2) the anhydrides of bibasic acids (*b*) contain the elements of a molecule of a bibasic acid, *minus* a molecule of water; (3), the anhydrides of tribasic acids (*c*) contain the elements of a tribasic acid, *minus* water.' Thus, using the modern formulæ and the type theory, we give a case of each form of acid:

Nitric Acid. Nitric Anhydride.

(*a*) $2\left(\begin{matrix}NO_4\\H\end{matrix}\right\}O_2) \quad - \quad H_2O_2 \quad = \quad \begin{matrix}NO_4\\NO_4\end{matrix}\Big\}O_2$

Sulphuric Acid. Sulphuric Anhydride.

(*b*) $\begin{matrix}S_2O_4\\H_2\end{matrix}\Big\}O_4 \quad - \quad H_2O_2 \quad = \quad S_2O_4.O_2$

Phosphoric Acid. Phosphoric Anhydride.

(*c*) $2\left(\begin{matrix}PO_2\\H_3\end{matrix}\right\}O_6) \quad - \quad 3H_2O_2 \quad = \quad 2(PO_2.O_3)$

The reader who may not at once be able to interpret these formulæ, will readily see that $\left(\begin{matrix}NO_4\\H\end{matrix}\right\}O_2) = NO_6.HO$, the old formula for nitric acid, that $\begin{matrix}S_2O_4\\H_2\end{matrix}\Big\}O_4 = 2(SO_3.HO)$, the old formula for sulphuric acid, which is now universally placed amongst the bibasic acids; and that $\left(\begin{matrix}PO_2\\H_3\end{matrix}\right\}O_6) = PO_5.3HO$, the old formula for tribasic phosphoric acid. According to the old system, the three anhydrides would be represented by NO_5, SO_3, and PO_5 respectively. We might have taken organic acids, as, for example, acetic acid, succinic acid, in place of nitric and sulphuric.

The anhydrides of the monobasic acids are formed in various ways; thus, hypochlorous anhydride is formed by the action of chlorine on oxide of mercury; nitric anhydride is formed by the action of chlorine on nitrate of silver, &c. By the action of ammonia, the anhydrides of monobasic acids are converted into amides; thus, benzoic anhydride ($C_{14}H_6O_3$) + ammonia (NH_3)= benzamide ($C_{14}H_7NO_2$) + water (HO). The anhydrides of tribasic acids are often formed by the mere action of heat on the acids, as is the case with lactic and tartaric acids.

The anhydrides present no uniformity of appearance; for example, carbonic anhydride (commonly known as carbonic acid, which in reality is $CO_2.HO$) is a gas; phosphoric anhydride is a white powder; nitric anhydride occurs in crystals; sulphuric anhydride is a ductile wax-like substance; while the anhydrides of the organic acids are oily bodies heavier than water.

The most important property of this class is their conversion into the corresponding acids, under the influence of water.

A'NHYDRITE, a mineral, consisting of anhydrous sulphate of lime, with some slight addition of sea-salt, appears in several varieties, as, 1. Granular; found in concretions with a foliated structure: 2. Fibrous; easily broken with a fracture in delicate parallel fibres: 3. Radiated; translucent: 4. Sparry, or Cube Spar: 5. Compact, of various shades, white, blue, gray, red. A. is converted into gypsum by combination with a certain proportion of water, and where it is found in large masses, as on the south of the Harz Mountains near Osterode, the surface consists of gypsum. For building, A. has no great value, on account of its tendency to this change; but some of its varieties, especially the Siliciferous or Vulpenite, found at Vulpino, in Upper Italy, are used for sculptures, and take a fine polish. When burned and reduced to powder, it is used as a manure, resembling gypsum in its effects.

ANHY'DROUS is the term applied to a chemical substance free from water. Thus, ordinary lime-shell as it comes from the kiln is simple lime. (CaO) without any water, and is called *anhydrous* lime; but when water is thrown upon the lime-shell, the liquid disappears by combination with the lime, which very much increases in volume and becomes *hydrated* lime (CaO,HO). Again, ordinary stucco, before being used by the modeler, contains only lime and sulphuric acid ($CaOSO_3$), with no water, and is therefore anhydrous; but when water is added, and the stucco sets into its mould, it combines with two equivalents of water, and becomes hydrated stucco ($2HO.CaOSO_3$). Examples of A. substances are also found amongst liquids; thus, alcohol free from water is called A. Alcohol; and in like manner we speak of A. Acetic Acid, A. Nitric Acid, &c.

A'NILINE is now universally regarded as, in a technological point of view, one or the most important organic compounds yet discovered (see DYE-STUFFS). Its chief physical and chemical characters are described under the head of *Phenyl* (q. v.), an organic radical, represented by $C_{12}H_5$, which, if aniline is (as Hofmann believes) a derivation of ammonia, replaces one of the atoms of hydrogen, yielding $\begin{matrix}C_{12}H_5\\H\\H\end{matrix}\Big\}N$, or $C_{12}H_7N$, which is the formula for this compound. There is one salt of aniline which requires notice, because its therapeutic value has been highly praised—viz., the sulphate of aniline, which is prepared by saturating a certain amount of aniline with dilute sulphuric acid, evaporating to dryness, and extracting the residue with boiling alcohol, which, on cooling, leaves white silvery scales of sulphate of aniline. To obtain the salt quite pure, it may be dissolved and separated a second time, after which it must be preserved in well-stoppered bottles. The importance which the aniline manufacture as a dye-stuff has acquired during the last few years has led to the study of its physiological, therapeutical, and toxicological properties, and hence to the hygienic precautions which should be adopted in the chemical works devoted to its preparation, as well as to the influences which the aniline colors may exert on those who employ them in dress, &c.

The *physiological* action of aniline has been recently studied by nearly a dozen independent observers, and the following are the principal results at which they have arrived: (*a*) When administered internally in a *moderate* dose, this substance causes a considerable muscular excitement, lasting for some minutes, and then gradually disappearing. When given a *poisonous* dose, it causes the immediate flow of viscid saliva, from which the animal tries to free itself by rubbing its mouth on the ground; in about ten minutes it becomes quiet and dull, and coldness supervenes, which continues and increases till death. The other most apparent symptoms are convulsive spasms, which first affect the hind legs, but soon extend to the anterior extremities. The eyelids are widely separated, while the pupils are somewhat contracted; and the tumultuous beating of the heart and the hurried respiratory movements show that the convulsive state of the other muscles has extended to those which regulate the most important vital functions. From ten to fifteen drops of aniline will thus prove fatal to a rabbit or to a dog of medium size. In still larger doses the poison

causes the animal's head to be convulsively drawn backwards, and death rapidly ensues. On examination after death, an odor of aniline is found to be given off by the blood, whose globules, when microscopically examined, are found to be partially disintegrated and deprived of their red pigment. (*b*) Its effects on animals, as well as those of nitro-benzine, from which it is produced, when *inhaled in a state of vapor*, have been carefully studied by M. Bergerow, whose experiments were so arranged as to imitate the conditions to which workmen are exposed in the aniline manufactories.

As might be expected, the effects of aniline are slower and less marked than when the substance is introduced into the stomach but are of the same character—the spinal chord and muscular system being more or less *excited;* while the vapor of nitro-benzine, which seems to act primarily on the brain, causes stupor. On the whole, the experiments tended to show that aniline, notwithstanding the terrible spasmodic symptoms which it excites, is less serious in its consequences and more transient in its action than nitro-benzine. The phenomena observed in experiments on animals closely correspond with those which have been observed in cases in which man has been exposed to the noxious vapor. The following case recorded by Mr. Knaggs seems well to illustrate the effects of inhaling a large dose of aniline vapor. A workman broke a carboy containing a large quantity of this liquid, which fell over him without entering his mouth. In trying to wipe up the aniline, he respired the vapor for some time, felt giddy, and complained of his head and chest. When seen some hours afterward, his face and body were of a livid leaden blue; the lips, gums, tongue, and eyes of a corpse-like bluish pallor; he was breathing by gasping, and appeared at the point of death. There was then no convulsion, and he was quite sensible. His pulse was small and irregular. Under very energetic treatment (alcohol, ammonia, chloric ether, internally, and cold affusions and sinapisms externally), he recovered. According to Dr. Letheby, who has reported a similar case, the aniline undergoes changes in the blood similar to those which it undergoes in the formation of the dyestuffs; and the mauve, magenta, &c., that are thus formed in the circulation, occasion the blue or violet color which the gums and mucous membrane of the mouth present in these cases.

The symptoms observed in the various experiments on animals led several physicians to try its therapeutic action in diseases of the nervous system. Sulphate of aniline was the form selected, and chorea the disease on which it was especially tried, although it has also been administered in epilepsy and other nervous diseases. The results are contradictory; and till further evidence of its value is adduced, it is not likely to supplant other medicines of the same class.

The workmen employed in the fabrication of nitro-benzine and aniline (for the two are prepared in the same works) suffer, for the first day or two after commencing this occupation, from severe supra-orbital headache, frequently accompanied with nausea and vomiting. While some persons suffer so severely that they are compelled to seek another employment, most, after a fortnight's experience, cease to feel the ill effects except accidentally, as after extra work or intense heat. Till they become seasoned, most suffer from vertigo, which rapidly disappears on exposure to a current of fresh air; and sometimes the vertigo is succeeded by loss of consciousness. Sometimes the face becomes congested, the patient staggers and falls to the ground in a semi-comatose state like a drunken man; in the course of an hour or two he wakes up, suffering only a feeling of fatigue.

In other cases, regular epileptiform convulsions of the limbs and tetanic spasms of the neck are observed, the patient often remaining in this state for an hour or more before recovery. Such may be regarded as the *acute* symptoms exhibited by new hands. Those who have become seasoned, complain of great general languor, a partial loss of sensation in the upper extremities, and constipation of the bowels; and they almost always present a decolorization of the skin and mucous membranes, in consequence of the impoverished state of their blood, which is said to be rapidly restored by making the patient inhale oxygen gas or compressed air. In reference to the influence of the aniline colors on the health of those who use them, it may be remarked, that even if they were poisonous, they adhere so tenaciously to the stuffs that are dyed with them, that there is no fear of the detachment of a noxious powder, as in the case of the arsenical greens. But fortunately they seem perfectly harmless even when taken internally, according to Sonnenkelb, provided they are completely freed from the arsenic, lead, mercury, or other poisonous metal that has been employed in the oxidation of the aniline. Hence, when they are quite pure, fuchsine and the allied pigments may be safely employed in coloring sweetmeats, liqueurs, confectionery, ices, &c., which it is very satisfactory to know, seeing how largely they are at the present day employed.

ANIMA, Con, in Music; with animation, in a spirited manner.

A'NIMA MUNDI literally signifies 'the soul of the world.' The doctrine contained in this phrase was a favorite one with the early philosophers, who conceived that there resided in nature a force immaterial, yet not intelligential, which was the source of all physical and sentient life. Plato held it impossible for pure spirit —the atmosphere in which alone eternal and archetypal ideas could exist—to bear any relation whatever to matter, and he therefore supposed the latter to be operated upon by an inferior agency, the *A. M.* In the system of the Stoics, the *A. M.* was conceived to be the sole vital force in the universe; it usurped the office of pure spirit, and the doctrine became indistinguishable from Pantheism (q. v.). The notion does not seem to have been entertained by the schoolmen, but it reappears in the writings of Cornelius Agrippa, Paracelsus, and Van Helmont, and, in a modified form, was held by More, Cudworth, and others.

ANIMAL AND ANIMAL KINGDOM. The popular classification of all bodies into three kingdoms—the animal, the vegetable, and the mineral—only assumed authority in comparatively recent times, and has done much mischief in exaggerating the apparent differences between plants and animals on the one hand, and in obscuring the fundamental distinction between these and minerals on the other. There are in reality only two kingdoms of nature, the living and the non-living—the organic and the inorganic. The famous aphorism of Linnæus, 'Stones grow; plants grow and live; animals grow, live, and feel,' is no longer satisfactory, for growth is of two distinct kinds. While growth in minerals takes place merely by *accretion*—addition of new particles to the external surface, that of living matter is by *intussusception*—the interposition of new molecules between those formerly present. Again, living matter, or *protoplasm*, is clearly distinguished by its chemical composition, it being composed of very highly complex compounds, or mixture of compounds of carbon, nitrogen, hydrogen, oxygen, and sulphur, together with water and salts. During life, it is incessantly *disintegrating* and combining with the oxygen of the atmosphere, many products of change, chief among which is carbonic acid, being evolved; and *reintegration* must therefore take place by intussusception, for which purpose new matter containing the necessary elements must be taken up, either from other organisms, or from the inorganic world. Certain *cyclical changes* are also exhibited by all forms of living matter—that is to say, each arises as a detached portion of some previous organism; develops into a similar form to that from which it arose; tends to reproduce itself; and, finally, ceasing to live, its protoplasm breaks up, and its elements ultimately return in a highly oxidized state to the inorganic world. Finally, certain conditions of temperature, pressure, presence of oxygen, &c., variable only within comparatively slender limits, are essential to the maintenance of life.

While living bodies are thus clearly distinguishable from inorganic, every attempt to erect a similarly sharp distinction between plants and animals completely breaks down. Vast numbers of animals are destitute of the power of locomotion, so that, for instance, corals were unhesitatingly referred to the vegetable kingdom until about a century ago; while diatoms, and many embryonic algæ and fungi, which possess marked powers of locomotion, would thus require to be ranked as animals. Nor is sensibility a purely animal characteristic; the well-known sensitive plant, the sun-dew and Venus fly-trap, exhibiting it in the most marked degree. Cellulose, again, which forms the coating of the vegetable cell, was regarded as completely characteristic of this; but many algæ and fungi are naked at some period of their lives, while the thick external tunic of those degraded vertebrates known as Ascidians has the chemical composition of plant cellulose. Chlorophyll, the green coloring matter of plants, is absent from fungi and from many flowering parasites, and is yet present in infusorians, in Hydra, and some other invertebrates, which are thus enabled to vegetate in sunshine, forming starch and evolving oxygen. Animals thus do not necessarily feed; while the well-known insectivorous plants (see DIONÆA, SUN-DEW) capture animals, and frequently digest them.

The attempt to establish a difference in structure is equally unsuccessful; for although the students of higher forms have no difficulty in grouping their flowers and ferns, their birds and beasts, into distinct series, the microscopist finds that these two great stems arise from a common root. It has therefore repeatedly been proposed to divide living forms into three groups—Animals, Plants, and *Protista*—a solution which, however, raises two new difficulties—that of distinguishing on the one hand between Protists and Animals, and on the other, between Protists and Plants. And thus every attempt to limit and define its forms has really resulted in proving the fundamental unity of life. The general study of these constitutes the science of Biology, of which the sub-sciences are : (1) Morphology, dealing with the structure of organisms, and including Anatomy and Embryology; (2) Distribution, dealing with the time and place of their occurrence on the earth; (3) Physiology, dealing with the study of their functions; (4) Ætiology, dealing with the explanation of the preceding facts by the rival hypotheses of Creation and Evolution.

These subjects are divided between botanist and zoologist, and their labors, while starting, as has been shown, from a common point, thence diverge widely. The results of Animal Morphology are outlined in the articles ZOOLOGY, VERTEBRATA, &c.; and those of the study of Animal Physiology under the heads of the separate functions, DIGESTION, REPRODUCTION, NUTRITION, &c. (q. v.). See also GEOGRAPHICAL DISTRIBUTION, EVOLUTION, &c.

ANIMAL CHE'MISTRY. The objects of animal or physiological chemistry are, to investigate the composition and properties of protoplasm and its various modifications which form the tissues and organs of living beings, and to ascertain the precise nature of the constructive and destructive changes which take place in those tissues and organs during the performance of their functions.

Protoplasm is always found to contain much albuminous or proteid matter, together with smaller quantities of amyloids and fats, and its molecule is conjectured to include representatives of all these three classes. Much water is also present, together with small quantities of numerous products of functional activity. We may briefly refer to these.

Proteids (q. v.) are at present classified as follows: (1) Native Albumens (egg, serum, &c.); (2) Derived Albumens (acid and alkali albumens, casein); (3) Globulins (globulin, myosin, vitellin, &c.); (4) Fibrin; (5) Coagulated Proteids; (6) Peptones; (7) Lardacein. Certain nitrogenous bodies allied to proteids are mucin, chondrine, gelatin, keratin, nuclein, &c., which form the principal components of mucus, cartilage-matrix, connective tissue, epidermic structures and cell nuclei respectively.

The *Amyloids*, or carbo-hydrates, from their far less complex structure, are much better understood. The most important of these are grape-sugar, (glucose, dextrose, diabetic sugar ($C_6H_{12}O_6 + H_2O$; milk-sugar (lactose), $C_{12}H_{22}O_{11} + H_2O$; muscle-sugar (inosite), $C_6H_{12}O_6 + 2H_2O$, glycogen or animal starch, $C_6H_{10}O_5$; and dextrin, $C_6H_{10}O_5$.

The fats, with their derivatives and allies, form very complete series, acid, neutral, and nitrogenous, of which the composition is tolerably well known. The acetic acid series ($C_nH_{2n}O_2$) is best represented, including formic (in blood and many tissues, also secreted by ants, &c.); acetic (in stomach during fermentation of food, in diabetic urine, &c.); propionic (in sweat, &c.); butyric (in milk, also sweat, urine); valerianic (in fæces); caproic, caprylic, and capric (in butter); lauro-stearic and myristic (in spermaceti, &c.); palmitic and stearic acid (in human fat). Of the oleic series, $H(C_nH_{2n-3})O_2$, many members are known. Human fat is a mixture of oleic, palmitic, and stearic acids in combination with glycerine. The glycolic acid series is represented by lactic acid, the oxalic series supplying oxalic and succinic acids. Cholesterin is abundant in nervous tissue and in bile, &c. The complex nitrogenous fats are lecithin, neurin, cerebrin, &c.

The most important product of nitrogenous waste in mammalia is urea $(NH_2)_2CO$, which forms the chief solid constituent of urine, and occurs in traces in blood and most tissues, except muscle, which, however, contains intermediate products of decomposition. Little is yet known of its relations to the proteids, from which it arises; but Schützenberger has succeeded in decomposing albumen into carbonic anhydride and ammonia in the same ratio as urea, and therefore concludes that the molecule of albumen is a complex ureide. Uric acid ($C_5H_4N_2O_3$) predominates in the urine of birds and reptiles, but it is also present in small quantities in that of mammals, and its salts form gouty and urinary concretions. Kreatin, kreatinin, and sarkin occur constantly in muscle; xanthin, guanin, &c., in urine; glycocoll and taurin, in combination in the bile acids, &c.; leucin and tyrosin, as products of pancreatic digestion.

Most of the preceding substances, though seldom constant, appear to be of exceedingly wide distribution throughout the animal kingdom. A few substances, including several of the more important proteids, grape-sugar, muscle-sugar, peptic and diastatic ferments, are also of frequent occurrence in the vegetable kingdom; while some of the most important and characteristic vegetable compounds also occur incidentally among animals, e. g., cellulose, chlorophyll, and starch. The whole progress of research tends to show the fundamental unity not only of the composition of animal and vegetable protoplasm, but also of most of the processes of waste and repair in animals and plants alike. Thus, for instance, it has very recently been proved by analysis that allantoin, a body analogous to urea, and known as an important waste product of the vertebrate embryo, is also found in quantity in opening buds in spring.

See BLOOD, BONE, MUSCLE, &c.; DIGESTION, NUTRITION, RESPIRATION, &c.; also FAT, UREA, ALBUMEN, PROTEIN, &c. Gamgee's *Physiological Chemistry*, and Foster's *Text-book of Physiology*.

ANIMAL HEAT. Living protoplasm is constantly in progress of disintegration and oxidation, and these processes are accompanied by evolution of heat. The greater the activity of change, the higher does the temperature tend to become. Not only, therefore, are the so-called cold-blooded animals really warmer than the surrounding atmosphere, but even plants recognizably evolve heat, and the temperature of certain flowers, where protoplasmic activity is highest, may sometimes almost reach that of the human body. See ARUM.

Even the infusoria evolve heat, as is shown by the slowness with which the surrounding water freezes. John Hunter showed that worms and leeches, slugs and snails, were all one or two degrees warmer than the air. Fishes generally are only two or three degrees warmer than the water they inhabit; but in some of the more active, like the bonito and tunny, a temperature of 99° F. has been observed, while the surrounding water was at 80½°. So, too, the frog, which usually averages about 1° warmer than the air, is 2° or 3° warmer while breeding; while in certain lizards and snakes, a difference of as much as 15° to 20° F. has been recorded. Newport's researches on insects show that while the temperature of the larva may vary from ½ to 4° above that of the atmosphere, that of the pupa is almost imperceptibly higher, and that of the perfect insect may rise enormously; a difference of from 2° or 3° at rest, to from 9° to 20° in excitement, having been observed in individual bees, and a much more marked elevation in the temperature of the whole hive, which has been observed to reach 102° F. Among the animals commonly termed warm-blooded, the temperature, although generally higher in birds than in mammals, varies from species to species, yet is very nearly constant during health in each. Thus, while the average temperature of the human body is about 98·4° F., that of the wolf is 3° or 4° lower, and that of the arctic fox 5° or 6° higher. In birds, the temperature varies from 100° in the gull and other aquatic birds, to nearly 112° in the swallow, while, on the other hand, a hybernating mammal like the lemming becomes temporarily cold-blooded, its temperature during the winter sleep being comparatively little above that of the atmosphere.

From the preceding details, it will be seen that while cold-blooded and warm-blooded animals thoroughly agree in evolving considerable amounts of heat, the difference between them lies in this, that in the former the means of loss of heat by the skin, &c., are great as compared with the normal production of heat, while in the latter the loss and production of heat are kept balanced.

Physiologically considered, the animal body is a machine for converting the potential energy supplied by food, into the actual energy of heat and mechanical work. Knowing the quantity and chemical composition of the food, it is easy to calculate the amount of energy furnished to the body. The average income of energy of the human body on normal diet is about 1,000,000 metre-kilogrammes, of which about 150,000 units can be expended in muscular work, the remaining 850,000 leaving the body in the form of heat. As to the channels by which heat leaves the body, Helmholtz has calculated that fully 2½ per cent. leaves the body with the fluid and solid egesta, about 5¼ per cent. is spent in warming the expired air, about 14¾ in evaporating the water expired by the lungs, and the balance, about 77½ per cent., by the skin, in conduction, radiation, and evaporation.

These general considerations once grasped, the apparent anomalies and variations in the temperature of different animals present no difficulty. See TEMPERATURE OF THE BODY, &c.; also any Manual of Physiology.

ANIMAL MAGNETISM, MESMERISM, or HYPNOTISM. From time immemorial, Egyptian conjurers and sorcerers have been accustomed to produce artificial somnambulism, usually by inducing their subject to gaze intently for a few minutes at certain cabalistic signs marked on the center of a white plate. The Yogins, a Hindu sect, also practise similar arts; while the peculiar states of trance or ecstasy into which the Mount Athos monks and other religious fanatics were accustomed to throw themselves, are of kindred nature. So too, many allusions in the works of classical authors relate to phenomena more or less of this kind.

About the middle of the 17th c., while the phenomena of terrestrial magnetism were attracting considerable attention, one Valentine Greatrakes, in London, professed to cure diseases by stroking with the hand. A century later, Gassner, a Swabian priest, employed a similar mode of treating disease, which he ascribed to demoniacal possession. About 1774, Mesmer, a Viennese physician, commenced to treat diseased organs by the application of artificial magnets. The phenomena exhibited by his patients, especially the more nervous of them, led him to adopt the view that the magnets operated not as special sources of influence, but as conductors of a magnetic fluid which he could communicate at will to the patient, even at a distance. Four years later, he commenced practice in Paris, with great success. His usual methods were to seat his patient with his back to the north, to press the pit of the stomach and make passes with his hands in front of his face, meanwhile fixing his patient's eye, and soothing him by the aid of music. Sometimes too he placed his

patients in connection with 'magnetized' trees, or set them in a circle around a covered vessel from which he professed to conduct the invisible fluid, thus inducing peculiar nervous conditions. In 1785 a Royal Commission was appointed to examine Mesmer's pretensions. These investigators found that the same phenomena could be produced in Mesmer's more nervous patients when blindfolded, by merely inducing them to suppose themselves in the neighborhood of any of Mesmer's magnetic appliances, though none were really present; while conversely, magnets and magnetic tree were alike powerless, if the patient were kept unaware of their proximity. The Marquis de Puységur at the same time discovered that he could induce artificial somnambulism without the aid of magnets, by passes alone; but unfortunately for further investigation, the subject fell into the hands of the arch-quack, Cagliostro (q. v.), and thus became extremely discredited by physiologists. Despite the unfavorable report of the French Commission of 1785, as well as of a later one in 1831, and other subsequent exposures, vague theories of magnetic influence, odylic force, new imponderable substance, electrobiology, or the like, kept constantly recurring, since science had nothing with which to replace them, until the investigations of James Braid, a Scottish surgeon settled in Manchester. In 1841 he went to a mesmeric séance, which seemed to him a mere triumph of imposture over credulity; but returning on another occasion to watch the details more narrowly, he was struck to find that the patient was really unable to keep his eyes open. After some reflection, he concluded that by continuous staring, the eyes with their nerve centers became fatigued, and the balance of the nervous system was thus destroyed. Resorting to experiment, he at once succeeded in throwing his servant and others into thorough mesmeric sleep by simply inducing them to gaze intently for a few minutes at the mouth of a bottle placed above, but close to the eyes. He thus proved the absolute dependence of the mesmeric phenomena upon the physiological condition of the patient, not on that of the operator; and found that he had henceforth to deal with a new order of cerebral states, henceforth to be classed with those of sleep, somnambulism, and insanity. He therefore proposed the word hypnotism, which now so advantageously replaces the terms animal magnetism and mesmerism. Braid continued to investigate the subject with great thoroughness and success for some years, and attempted the treatment of certain diseases by inducing hypnotism. Unfortunately, however, the evil reputation which the subject had so naturally obtained, prevented the due appreciation of Braid's discoveries, and it was not until about 1875 that the subject commenced to be thoroughly investigated by physiologists. Preyer and Heidenhain in Germany, and Richet in France, have confirmed and extended Braid's results, and we may therefore briefly sum up their results, premising that no scientific observer has ever confirmed the statements of mesmerists as to clairvoyance, reading of sealed letters, influence on unconscious persons at a distance, or the like; and, as above stated, the influence of the mesmerizer is unnecessary, and in all cases unimportant.

The physiological changes which are set up are usually as follows: A spasm of the accommodating apparatus first takes place, the pupils meanwhile dilating, and the eye-balls being protruded, while the eyelids droop. Respiration and circulation become greatly accelerated, and perspiration frequently ensues. Finally, profound stupor may ensue. A very remarkable degree of insensibility to pain exists, so that even surgical operations may sometimes be performed as well as under chloroform. The reflex irritability of all the voluntary muscles is greatly increased (indeed for days after the experiment), so that stroking an area of skin produces a spasm of the subjacent muscles, which may even spread over the whole body, producing a perfectly cataleptic rigidity, so that Heidenhain indeed considers the hypnotic state as nothing more than an artificially produced catalepsy. These considerations indicate the danger of repeatedly subjecting the same person to hypnotic experiments, lest the abnormal state should be rendered permanent. Moreover, since in some persons the hypnotic state begins with general convulsions, the non-medical reader is warned against attempting to hypnotize.

During hypnotism, consciousness is diminished or dormant. The patient may, if only slightly affected, remember what has happened; if more fully hypnotized, he has no remembrance of his actions until hints are given; in the most complete state, he has no remembrance whatever.

In hypnosis, however, sensory perceptions take place; but these are not converted into conscious ideas—in other words (as constantly happens in a 'brown study'), the sensation is present, but the power of directing the attention towards it is temporarily lost. Reflex action, however, goes on all the more freely in the absence of the inhibiting will; and thus movements made before a hypnotized person are perceived by the imperfectly closed eyes, and the stimulation of the organ of sense sets up a material change in the central nervous system, which liberates movements, apparently voluntary, yet not really so. Thus the patient may be induced to imitate every movement, however absurd or trivial, which is presented to him. The tendency to mimicry, so common, especially in children, monkeys, parrots, &c., is thus intensified, or rather the stimulus of the sensory impression is allowed to work unchecked.

As sometimes in ordinary sleep, but with ease and certainty, dreaming may be induced. Thus the medium may be conducted through all the stages of a journey, may be plunged into grief or raised to exuberant happiness by a few judicious suggestions. This state is nearly related to that of 'automatism at command,' where the medium obeys orders like a docile dog. Thus, as a crucial experiment, Heidenhain ordered his brother, a young medical student, to cut off his whiskers, the product of a year's assiduous cultivation, to the unbounded vexation of the unfortunate youth on awaking. So too, placing the body in a given position calls up the appropriate actions. A pillow, properly placed in the medium's arms, is nursed like a baby; music makes him dance; and so on. In all cases, the spoken command, the position of the limbs, or the sensory stimulus, sets up the impulse to the actions indicated, without either intelligence or volition being awakened.

The patient never falls down, and the power of co-ordinating the movements of walking, &c. is nearly perfect; his attitudes have often an unusual grace, and in the lighter stages of hypnotism he may converse freely and even with unwonted intelligence and emotion, due, doubtless, partly to freedom from the restraint of a knowledge of the surroundings, partly to the concentration upon a single train of thought.

Very sensitive patients may be hypnotized by monotonous sounds like the ticking of a watch, or even by expectant attention, when alone.

Numerous other remarkable phenomena have been described. Thus, by gentle pressure on the neck of a patient, he can be induced to repeat words spoken in his presence, especially when the sounds are directed to a sensitive area just below the sternum. Automatism at command is greatly facilitated by imposition of the operator's hand on the patient's head. By passes on one side, catalepsy or paralysis of the opposite side only can sometimes be induced. Remarkable disturbances of the sensation of color may take place; and so on.

The state of the brain during hypnosis is not as yet well understood. The activity of the ganglion-cells of the cerebral cortex (with which the functions of consciousness are believed to be specially associated) appears to be inhibited by the gentle prolonged stimulation. The cerebral arteries are not contracted. Additional light is being obtained by experiments upon animals, of which many can be thrown into a state closely resembling, if not identical with the hypnotic.

Hypnotism is again coming into use in medical and surgical practice, and its facts have also very important bearings on the phenomena of reverie, trance, somnambulism, religious excitement, mania, spiritualism, &c. See Braid's *Magic, Animal Magnetism, &c.* (3d ed., Lond. 1852); Heidenhain's *Animal Magnetism* (Lond. 1880).

ANIMA'LCULE, a term which, although etymologically applicable to any very small animal, is limited in ordinary language to those which are microscopical. Animalcules exist in prodigious numbers, their size being such that myriads of them find ample space for all the movements of an active life within a single drop of water. Sea-water often contains them in enormous numbers, and the luminosity of the sea is often due to this cause (*Noctiluca*). Although, contrary to a widely diffused belief, they occur only in very small number in drinkable waters, they abound wherever water becomes stagnant, or contains decomposable organic matter. Thus rain-water allowed to stand long in an open cistern, or the water of a vase in which cut flowers are placed, soon becomes more or less turbid and offensive; and if a drop be placed on a slip of glass and examined even with a pocket lens, a multitude of living beings can be seen moving rapidly in all directions, while minute specks are also to be seen in motion between these.

On the application of higher microscopic power, new organisms come again into view, so that the variations of size between the invisible inhabitants of one drop are as great as those between whales and minnows. An immense variety of animalcules can very easily be studied by collecting impure water from a dozen different sources, and keeping it separate in open wide-mouthed bottles in a window, and observing from time to time, for not only do the contents of the different vessels differ from each other, but they also vary greatly with the season, so that an unending source of new surprises is thus open to the most inexperienced microscopist without leaving his room. Besides obtaining numerous varieties of microscopic algæ, diatoms, bacteria, &c. (see ALGÆ, DIATOMACEÆ, PROTOPHYTES), examples of all the leading forms of minute animal life are thus to be obtained; and these, at first supposed to belong to the same general type of structure, are now known to be extremely varied. The simplest form with which the observer will meet is a naked lump of jelly-like protoplasm, constantly flowing into new shapes, the *Amœba* (see PROTEUS); while other masses of jelly, the Foraminifera, may be found

possessed of coverings of sand, or even carbonate of lime, and only protruding their irregular processes (pseudopodia) through its openings. Others, again, the sun-animalcules of fresh water, and the Radiolarians, which inhabit the sea, are usually possessed of a beautifully marked flinty skeleton. These groups are usually united under the head of *Rhizopoda* (q. v.). Another great series, in which the form of the body is usually definite, the pseudopodia being generally replaced by vibratile threads or cilia, are termed the *Infusoria*. All these are the equivalents only of a single cell of higher animals, and are, therefore, grouped into the sub-kingdom Protozoa; but many animalcules are of far more complex organization. Thus the wheel animalcules (See ROTIFERA) are segmented, worm-like animals; and the larvæ of almost all marine and fresh-water invertebrates are at an early stage free-swimming and microscopic. From its extreme vagueness, therefore, the term A. is now disused by scientific writers.

Despite their apparent insignificance, certain animalcules, by virtue of their almost imperishable skeletons, are among the most important agencies which have built up the crust of the earth. The surface of the sea is largely inhabited by Radiolarians and Foraminifera, the former preponderating in cold, the latter in temperate and tropical waters. As they die, their skeletons sink to the bottom, and form mud or ooze, which through time and pressure becomes consolidated into rock. Many polishing stones, &c., are thus mainly composed of Radiolaria; while chalk is principally formed by the skeletons of Foraminifera, and greensand of internal siliceous casts of these. Many limestones, marbles, quartzites, &c., are probably of similar origin, although all trace of organic structure may have been eliminated by metamorphic change. See Carpenter *On the Microscope*, and the *Micrographic Dictionary*.

ANIMALS, CRUELTY TO. England has the honor of first making this a distinct subject of public attention by the formation of societies for its prevention, and by legislative enactments making it punishable. The English Society for the Prevention of Cruelty to Animals, founded in 1824, has become very influential and active; the Scottish Society, founded in 1839, differs slightly in its mode of prosecution. In the United States, above thirty branches of a similar organization were founded between 1866 and 1881; and the movement has extended into France and Germany.

ANIMALS, CRUELTY TO (in Law). This is an offence against the criminal law, and has frequently formed the subject of legislation, the chief act of parliament being the 12 and 13 Vict. c. 92 (passed in 1849). By this statute it is provided, that if any person shall cruelly beat, ill-treat, over-drive, abuse, or torture any horse, mare, gelding, bull, ox, cow, heifer, steer, calf, mule, ass, sheep, lamb, hog, pig, sow, goat, dog, cat, or any other domestic animal, he shall forfeit a sum not exceeding £5 for every such offence, recoverable before a justice of the peace in a summary way; and if by any such misconduct he shall injure the animal, or any person or property, a further sum not exceeding £10 to the owner or person injured. The acts also inflict penalties in the case of conveying cattle by railway without water-supply, &c., causing unnecessary pain or suffering; in the case of bull-baiting, cock-fighting, and the like; and regulates the business of slaughtering horses and cattle not intended for butcher-meat.

The act of 1839 forbids the use of carts drawn by dogs. The 39 and 40 Vict. c. 77 (1876) limits vivisection, and forbids painful experiments on animals, unless the operator is licensed by the Home Secretary. The object must be the discovery of knowledge or the prolonging of life; and the animal must be rendered insensible during the operation. The penalty is £50 for the first offence, £100 for the second. The Wild-Birds Protection Act (1880) provides a close time for birds between March and August.

Formerly, in Scotland, this offence was punishable at common law—that is, according to the Scottish legal principle, common law as distinguished from *statute* law. An act of parliament, however, passed in the year 1850, put the law on this subject in Scotland on the same footing as it is in England. See ANIMALS, Cruelty to, in AM. SUPP.

ANIMALS, WORSHIP OF, a stage in the religious evolution, characteristic of many of the less cultured races, which has sometimes held its place in the higher stages of civilization. It originates in Animism (q. v.), or spirit-worship, which is a universal phenomenon of humanity. Among primitive peoples, all animals are supposed to be endowed with souls, which in many cases have formerly animated human beings.

Hence a likeness is often recognized between an animal and some deceased friend, and the animal is addressed as the person would have been, and honored with a kind of worship. The case of an ancestral soul, worshiped as incarnate in an animal body, thus forms a link between manes-worship and beast-worship; and we find this connection otherwise in the veneration of a particular species of animal by a particular family, clan, or tribe. Many tribes call themselves by the name of, and even derive their pedigree from some animal. Its cries become the omens of the tribe, and thus originate the divination and augury of more civilized nations. This curious and widespread belief in a descent from animals in connection with a belief in transmigration into other forms, goes far to explain such phenomena as lycanthropy (see WERE-WOLF) and the unions between animals and human beings so common in folk-lore, and has doubtless originated in totemism (see TOTEM). The division of a tribe into the families of the bear, crane, turtle, &c., indicates a time when families claiming descent from ancestors holding those names, have banded themselves together for the common interest; and that an ancestor should be called the bear, or turtle, or crane, indicates a time still further back, when the name was given him for some reason. Many ethnologists, notably Sir John Lubbock and Herbert Spencer, suppose these names to have been originally personal epithets, designating qualities or characteristics of the individual (thus, a slow man would be called a turtle, a very long-legged man a crane), which became family surnames, and eventually gave rise to myths of the families being actually descended from the animals in question as ancestors; while popular mystification between the great ancestor and the creature whose name he held and handed down to his race, led to veneration for the creature itself, and thence to full animal-worship. Though such nicknaming as this has occurred, totemism must have had a much broader and deeper foundation. Perhaps the best explanation is that suggested by the worship of personal deities, seen in its greatest development in the North American native races. The *manitou* of the Indian is almost always an animal, and is chosen by each individual at his coming of age, being pointed out to him in a dream, produced by the greatest religious act of his life—his first fast. This animal then becomes an object of worship, and its skin is carried about the person as a fetich, and its likeness painted on the body, or sculptured on the weapons. Thus arise tattooing and heraldry—forms of worship—and the superstitious fear the savage entertains of killing or eating his manitou, or patron-animal. The manitou develops into the totem, or sacred-animal, of the gens or family which descends from that person, and worship is paid to all representatives of its species. Equally strong evidence is obtained from the ancient nations. Some facts are preserved in the signs of the Zodiac, the majority of which are animals, and compounds of human and animal forms. There is nothing in the grouping of the stars to suggest animal forms, and the probability is, that in ancient as in modern times, stars, when named, were given names of distinction that commanded respect, if not veneration; therefore that the animals whose names were transferred to the stars were, on earth, highly, if not religiously venerated.

This is borne out by the legends of the transference to the heavens of particular animals. The frequency, also, of animal-names, and of representations of the same animals upon coins, point to the same conclusion. In the old Egyptian animal-worship, also, the theory of tribe-fetiches and deified totems is borne out. We find deities patronizing special sacred animals, incarnate in their bodies or represented in their figures; while many of the sacred creatures are worshiped in one locality, yet killed and eaten with impunity elsewhere. In the modern world, the most civilized people among whom animal-worship vigorously survives lie within the range of Brahmanism. Here the sacred cow is not merely to be spared; she is, as a deity, worshiped and bowed to daily by the pious Hindu. Siva is incarnate in Hanuman, the monkey-god; the divine king of birds, Garuda, is Vishnu's vehicle; and the forms of fish, and boar, and tortoise are assumed in the avatar-legends of Vishnu, which are at the intellectual level of those Red Indian myths which they so curiously resemble. Perhaps no worship has prevailed more widely than that of the serpent. It had its place in Egypt and among the Hebrews; in Greece and Rome; among the Celts and Scandinavians in Europe; in Persia and India; in China and Tibet; in Mexico and Peru; in Africa, where it still flourishes as the state religion in Dahomey; in Java and Ceylon; among the Fijians, and elsewhere in Oceania. And even within the limits of Christianity, we find the sect of the Ophites, who continued or renewed snake-worship, blended curiously with purer rites. It is evident, however, that although some animals may have received a preference, yet all had a share in the superstitious reverence of primitive peoples; and this broad universality of their worship militates against any other theory of its origin, except that based on the theory of the transmigration of souls. See Fergusson's *Tree and Serpent Worship* (1868); M'Lennan in the *Fortnightly Review* for 1869 and 1870; Herbert Spencer in the *Fortnightly* for 1870; Dr. Tylor's *Primitive Culture* (1871); Dr. Robertson Smith in the *Journal of Philology* (1880); and Dorman's *Origin of Primitive Superstitions* (Philadelphia, 1881).

A'NIME, a resin exuding from the trunk of the *Hymenæa Courbaril*, a large tree of the natural order *Leguminosæ*, sub-order *Cæsalpineæ*, a native of New Spain and Brazil. It somewhat resembles copal, but is more easily soluble in alcohol.—The name A., or Gum A., is, however, also given in Britain to a resin called in India copal, the produce of *Vatiria Indica*, a tree of the natural order *Dipteraceæ*; whilst the copal of Madagascar is produced by

Hymenæa verrucosa, and that in Brazil in great part by several species of *Hymenæa*, a tree of which the genus is also regarded as the probable source of the copal of Mexico.

ANIMISM, a term originally used to denote the theory of Stahl (q. v.), which regarded the vital principle and the soul as identical, but now used in the sense given to it by Dr. Tylor, as the general doctrine of spiritual beings. It is convenient to take the belief in spiritual existence as a minimum definition of religion. It appears among all low tribes with which we have any intimate acquaintance; and all travelers who have hitherto asserted the existence of races without it have been afterwards refuted by the facts. It may be considered to have arisen simply from the evidence of the senses, interpreted by the crude and child-like science of the savage. Two problems seem to have exercised the primitive mind. First, What is it which makes the difference between a living body and a dead one? what causes waking, sleep, trance, disease, and death? In the second place, What are those human shapes which appear in dreams and visions? The savage makes these two groups of phenomena each help to account for the other, by combining both in the conception of an apparitional or ghost soul, which is conceived of as an insubstantial human image, resembling a vapor or a shadow, the cause of life and thought in the individual it animates, capable of leaving the body and appearing to men waking or asleep as a phantasm separate from the body of which it bears the likeness, and able to enter into, possess, and act in the bodies of other men, of animals, and even of things inanimate. When the sleeper awakens from a dream, he believes that his soul has really been away, or that the souls of others have come to him. His body has been still, but his living self or soul, his phantom or image, has been active. And have not waking men, in broad daylight, sometimes seen these human phantoms in what are called visions or hallucinations; and after a man has died and been buried, has not his phantom-figure continued to appear to the survivors in dreams and visions? And what is his reflection seen in still water, or his shadow falling behind him, or the breath seen for a moment issuing from his lips like a faint cloud, but the man's ghost-soul becoming visible for a moment and vanishing again? In the thought of the savage as of the child, personality is ascribed not to the men and beasts only, but also to things. His ghosts do not come to him naked, but dressed in the well-known clothing worn in life. This is the explanation of one of the most wide-spread rites of animistic religion—the offering of funeral sacrifices for the service of the dead.

The phantasmal images of the objects offered pass into the possession of forms shadowy like themselves—the souls of the dead. These spiritual beings fill all nature, animate and inanimate, and their life is a continuation, and not a new life, in savage religion. They transmigrate into human beings, animals, plants and lifeless things, and they can avenge their past and present wrongs by bringing disease upon the individual. The man keeps after death the temper he had in life, and is powerful for good or evil according to his inclinations while alive. From this, and not from mere family affection, arises naturally the ancestor-worship, which has been from remote antiquity, and is still, the main faith of the larger half of mankind Above the commonalty of such spirits the primitive mind recognizes higher spirits, or gods. Sometimes, by an extension of the natural order of life, the souls of great chiefs and warriors continue the same superior rank into the unseen world, and rise to divine honors. And the idea of the divine ancestor may even be carried far enough to reach supreme deity, as when the Zulus, working back from ancestor to ancestor, reach Unkulunkulu, the Old-old-one, as the creator of the world, thus attaining to monotheism by a natural evolution. In the most rudimentary stages of religion, ethical conceptions are but feebly developed, and there is little trace of moral retribution after death. The gods require their worshiper to perform his duty towards them, but do not necessarily concern themselves with his doing his duty to his neighbor. Yet the practical effect of religion on men's lives early begins to show itself. The worship of the dead naturally encourages good morals, for the ancestor who, while alive, saw that the members of his family did right by one another, and whose condition in the spirit-world is a continuation of his earthly character and rank, will naturally insist on this being continued when he is a divine ghost, powerful to favor or to punish. Traces of the antagonism between good and evil are found also in the lower races. The world is regarded as the battle-ground of good and evil spirits, and thus arises the idea of a dualism, or contest between these ranged under a supreme good and evil deity, which attains so great development in the ancient religion of Persia.

Animism, then, appears to the savage, on the evidence of his senses, to be a rational and fairly consistent philosophy, and it has maintained its place in higher civilizations. It is taught by Lucretius, when he makes his theory of film-like images of things (*simulacra* and *membranæ*) account both for the apparitions which occur to men in dreams and the images which impress their mind in thinking; and when Democritus explained the facts of perception, by declaring that things are always throwing off images of themselves (*eidola*), which enter the recipient soul, he was simply answering the fundamental question of metaphysics, by turning to a new purpose, as a method of explaining the phenomena of thought, the savage doctrine of object-souls. Animism is not a degeneracy from a higher culture.

In it we find no survivals which show inconsistencies with it; whereas, in all higher cultures, there occur survivals of primitive superstition, wholly inconsistent with the more advanced beliefs. Most primitive superstitions are found surviving, in modified form, in poetry and folk-lore, and often in common words and phrases, which have a meaning deeper than metaphor. Animism is not itself a religion, but a sort of primitive philosophy, which not only controls religion, but the whole life of the natural man. It represents a stage in the religious evolution which is still represented by the so-called Nature-religions, or rather by the polydæmonistic magic tribal religions, early developed among civilized nations into polytheistic national religions resting upon a traditional doctrine.—See Tylor's *Primitive Culture* (2 vols. 1871), on which this article is mainly founded; also *The Origin of Primitive Superstitions* (Philadelphia, 1881), by Rushton M. Dorman.

ANIONS. See ANODE.

A'NISE (*Pimpinella Anisum*), an annual plant of the natural order *Umbelliferæ*. The genus *Pimpinella* has compound umbels, usually without involucres. Two species are natives of Britain; they are commonly known by the name of Burnet Saxifrage, and have no properties of importance. A. is a native of Egypt. It is an annual plant; the stem is 1½ to 2 feet high, dividing into several slender branches; the lower leaves roundish-heart-shaped, divided into three lobes, and deeply cut; those of the stem pinnate, with wedge-shaped leaflets. The umbels are large and loose, with yellowish-white flowers. It is much cultivated in Egypt, Syria, Malta, and Spain, and even in Germany, especially in the district around Erfurt, where a large quantity of the seed is annually produced. Attempts were made, more than 200 years ago, to cultivate it in England; but the summers are seldom warm enough to bring it to perfection. It is occasionally sown in gardens for a garnish or for seasoning. A.-seed (*aniseed*) is used as a condiment and in the preparation of liquors; also in medicine as a stimulant stomachic, to relieve flatulence, &c., particularly in infants; and it has been used in pulmonary affections. It has an aromatic, agreeable smell, and a warm, sweetish taste. It contains a volatile oil, called *Oil of A.*, which is nearly colorless, has the odor and taste of the seed, and is employed for similar purposes. One hundred-weight of seed yields about two pounds of oil, which is obtained by distillation; but at Erfurt the oil is made from the stems and leaves, the whole plant being aromatic. *A.-water*—water flavored with the oil, and sugared—is much used in Italy as a cooling drink.

STAR ANISE, or CHINESE ANISE, is the fruit of *Illicium anisatum*, a small tree of the natural order *Magnoliaceæ*. See ILLICIUM. It received its name from the star-like form of the fruit, which consists of a number (6—12) of hard, woody, one-seeded carpels. The tree has evergreen leaves, somewhat like those of the common laurel. The whole plant is carminative, and is used by the Chinese as a stomachic and as a spice in their cookery. The qualities of the fruit so much resemble those of the common anise, that it may be used instead of it, and by distillation it yields an oil which is very generally substituted for oil of anise, and is imported into Europe in considerable quantity, to be used instead of it. Star aniseed is also imported, chiefly from China and Singapore.

A'NJOU, a former province in the north-west of France, of about 3080 square miles in extent, now forming the department of Maine-et-Loire, and small parts of the departments of Indre-et-Loire, Mayenne, and Sarthe. Its capital was Angers. The ancient inhabitants of A. were the *Andegavi*, who long and resolutely resisted the Roman arms.—The male line of the Counts of A., who took their name from it, having become extinct in 1060, their title and possessions passed by the female line to the powerful House of Gatinais; and from one of this family, Godfrey, Count of A., spring the Plantagenets. He conquered the greater part of Normandy; assumed the title of duke; and in 1127 married Matilda, the daughter of Henry I. of England, and widow of the Emperor Henry V. Through her, his son inherited the English throne, which he ascended in 1154 as Henry II. A. now became one of the possessions of the kings of England; but in 1204, the French acquired it by fortune of war; and it was bestowed as a fief upon Philip, the son of Louis VIII., and afterwards upon his brother Charles, who became the founder of that House of A. which gave kings to Naples, Sicily, and Hungary. Charles II. of Naples gave A. to his daughter Margaret on her marriage with Charles of Valois, the son of Philip IV. Her son ascended the throne of France as Philip VI. in 1328. King John, in 1360, made A. a duchy, and gave it to his son Louis, and he succeeded to the crown of Naples, it remained a possession of the kings of Naples till the overthrow of that dynasty, when René II., the last of his family,

was deprived of it by Louis XI., who permanently annexed it to the French crown in 1484. Since that time, it has merely given an honorary title to princes of the royal family. The last who bore it was the grandson of Louis XIV., who became Phillip V. of Spain.

ANKARSTROM, JOHN JACOB, the assassin of Gustavus III., king of Sweden, born in 1761, the son of a lieutenant-colonel. He came very early to court, in the capacity of a page, and next entered the army; but having obtained the rank of captain, left it in 1783; married and settled in the country. He was a man of violent feelings and rough manners, and much opposed to the measures taken by the king for curtailing the power of the senate and of the nobles. Implicated in certain intrigues in the island of Gothland, he was accused of treason, but released for want of positive evidence. His hatred to the king was increased by the harsh usage he met with in the course of his trial. In 1790, he went to Stockholm, and together with General Pechlin, Counts Horn and Ribbing, and others, planned the assassination of the king. A. begged that the execution of the deed might be left to him; but Horn and Ribbing disputing the point, they drew lots, and the lot fell upon A. In 1792, the king convoked the Diet at Gefle, and the conspirators hoped upon that occasion to carry out their purpose; but being thwarted in this, they had to wait till the 15th of March, when Gustavus was to attend a balmasqué, during which A. shot at and mortally wounded him. He was instantly apprehended, and at once confessed his crime, stoutly denying, however, that he had any accomplices. On the 29th of April, he was condemned to death, publicly flogged for three successive days, and then beheaded. He went to the scaffold with perfect composure, rejoicing to his last moment in the success of his crime.

A'NKLAM, or ANCLAM, a town of Prussia, in the province of Pomerania, 44 miles north-west from Stettin, on the right bank of the Peene, and 4 miles from its mouth in the Kleine Haff. The river is navigable to A., which carries on a considerable commerce, and has long been a place of commercial importance, having been admitted into the Hanseatic League in 1319. It has manufactures of linens and woollens; it has also several breweries, soap-works, and tanneries, and ship-building is actively prosecuted. During the middle ages A. suffered more than almost any other town from fire and pestilence; and in the wars of the 17th and 18th centuries, it was again and again besieged and sacked. On the close of the Seven Years' War, in 1762, its fortifications were happily dismantled. It is still, however, surrounded by an old wall with three gates. It contains many interesting specimens of the Hanseatic or North German architecture, very like the Flemish. Pop. (1875) 11,847; (1880) 12,361.

ANKO'BAR, the capital of the kingdom of Shoa, in Abyssinia, is built 8198 feet above the sea-level, on the ascent of the table-land, in lat. 9° 34′ N., long. 39° 35′ E. The higher portion of the town is fortified in a very primitive way, by means of a palisade constructed of stakes, with intertwisted branches of trees. The royal palace, unlike the most of the buildings, which are chiefly of wood, is built of stone and mortar, although the roof is thatched. The vegetation around the place is extremely rich, and the air is both cool and pure, so that A. is a very agreeable residence, and is consequently favored with the presence of the court during a portion of the year. Pop. 10,000.

ANKYLO'SIS (Gr. *ankulosis*, bending or crooking; *ankule*, stiff-joint), is a term used in surgery to imply a stiffness in any joint. It is usually the result of disease, which, having destroyed the articular cartilages, leaves two bony surfaces opposed to each other. The reparative powers of nature cause a union to take place by means of granulations between them. This bond of union may become osseous, so as to render the joint perfectly rigid, or it may continue membranous, allowing of a certain amount of motion. Some joints, especially the elbow, are very apt to become ankylosed; and in the knee or hip-joints, this osseous A. is reckoned the most favorable termination to disease, as the limb can then afford a rigid support for the trunk. Joints, stiff through a membranous A., may be forcibly bent, and the bond of union ruptured, so as to restore mobility, or allow of their being placed in a convenient position. A. of the joints between the ribs and the vertebræ is common in advanced age; and there are some cases on record of universal A. of all the joints. A case occurred in 1716 of a child only twenty-three months old with all its joints thus stiffened; and there are in various museums specimens of adult bodies in this condition.

ANN, or ANNAT, in Scotch law, signifies the half year's stipend payable for the vacant half year after the death of a clergyman, to which his family or nearest of kin have right, under an act of the Scottish parliament passed in the year 1672. It is a right that does not belong to the clergyman himself, but to his next of kin absolutely, and therefore can neither be assigned or disposed of by him nor attached for his debts. Compare ANNATES.

ANNA, ST., according to tradition, was the daughter of Mathan, priest of Bethlehem, and the wife of St Joachim. After twenty-one years of barrenness, she is said to have given birth to the Virgin Mary, the mother of the Saviour. Nothing positive is known regarding her life; her name does not occur in the Scriptures, nor even in the writings of the Fathers during the first three centuries. The first who mentions her is St. Epiphanius, in the 4th c.; but towards the 8th, she was all but universally invoked. Her body was believed to have been transferred from Palestine to Constantinople in 710 A.D.; and her head to Chartres, by Louis de Blois, about 1210 A.D. The inhabitants of Duren (Duchy of Juliers, Germany) also pretend to have a head of St A.; and a third is believed to be in possession of the church at Ursitz, in the diocese of Würzburg, although numerous other churches claim to be equally favored. The Roman Catholic Church has a festival in her honor on the 26th of July; the Greek, on the 9th of December. In Austria, Bavaria, and other Catholic countries, this festival is one of great importance. In honor of St. A., a fraternity, called the Fraternity of St. A., was instituted in the 13th c. After the Reformation, it was organized anew by the Jesuits; and in modern times, has manifested some vitality in Bavaria and Catholic Switzerland.

A'NNABERG, a town of the kingdom of Saxony, in the district of Zwickau, on the right bank of the Selm, 18 miles south from Chemnitz. It is situated 1800 feet above the level of the sea, in a mining district; the surrounding hills containing mines of silver, tin, cobalt, and iron. It has extensive manufactures of lace and of silk ribbons. The ribbon manufacture was introduced here by Protestant refugees from Belgium, who fled from the persecution carried on by the Duke of Alva. Pop. (1880) 12,956.

ANNA CARLOVNA, regent of Russia during the minority of her son Ivan, was the daughter of Charles Leopold, Duke of Mecklenburg, and of Catharine, sister of the Russian empress, Anna Ivanovna (q. v.). In 1739, she married Anthony Ulric, Duke of Brunswick-Wolfenbüttel. Her son, Ivan, born August 20, 1740, was nominated by the empress Anna Ivanovna as her successor. This was done at the instigation of Biron (q. v.), the empress's favorite, whose object was to secure the regency for himself: and the empress, on her deathbed, actually appointed him regent, but he continued in power only for a short time. She died on October 28, 1740, and his overthrow took place on the 18th of November in the same year. A. C. now proclaimed herself Grand-duchess and Regent of Russia; but she showed no capacity for managing the affairs of a great country, spent her time in indolent enjoyments, and resigned herself very much to the guidance of one of the ladies of the court, Julia von Mengden. A conspiracy was formed by a party desirous of raising to the throne Elizabeth, daughter of Peter the Great and of Catharine, and this was accomplished on December 6, 1741. The infant Ivan was sent to the castle of Schlüsselburg, where he was afterwards murdered; Anna and her husband were condemned to imprisonment for life, and conveyed to Cholmogory, a town upon an island in the Dwina, near the White Sea. Here she bore two children, and died in childbed in 1745. Her husband remained a prisoner for thirty-nine years, and died in 1780.

ANNA COMNE'NA, a learned Byzantine princess, author of one of the most valuable works to be found in the collection of the Byzantine historians, was the daughter of the Emperor Alexius I. (Comnenus), and was born on December 1, 1083. She received the best education that Constantinople could give, and early displayed a fondness for literary pursuits; but was also habituated from her childhood to the intrigues of the court; and during the last illness of her father, she entered into a scheme, which her mother, the Empress Irene, also favored, to induce him to disinherit his eldest surviving son, John, and to bestow the diadem on her. Failing in this, she framed a conspiracy against the life of her brother (1118); and when her husband, Nicephorus Bryennius, a Byzantine nobleman, either from timidity or virtuous principle, refused to join in it she passionately lamented that she had not been born a man, and upraided him as having the soul of a woman. Her brother spared her life, but punished her by confiscation of her property, which, however, he soon after generously restored. Disappointed and ashamed, she withdrew from the court, and sought enjoyment in literature. On the death of her husband (1137), she retired into a convent, where she died in 1148. Her life of her father, entitled *Annæ Comnenæ Alexiados libri* 19, is full of professions of careful inquiry and a supreme regard for truth, but 'the perpetual strain of panegyric and apology awakens our jealousy.' The style is characterized by an elaborate affection of rhetoric. The best edition is that of Schopen (2 vols. 1839). See Oster's *A. Comnena* (1868—71).

ANNA IVANO'VNA, Empress of Russia, was born on the 8th February 1693, and was the second daughter of Ivan, the elder brother of Peter the Great. She was married in 1710 to the Duke of Courland, the last of his race, who died in the following year; and she obtained the duchy of Courland for her favorite, Biron, a

Courlander of low birth. The throne of Russia was offered to her by the Supreme Council on the death of Peter II. in 1730, on conditions which greatly limited the power of the monarchy, but which she soon broke. Her elevation to it was very much owing to the intrigues of the Chancellor Ostermann, who had had the charge of her education, but who was disappointed in finding her not grateful and tractable, as he expected. For three years, however, her rule was mild, humane, and equitable. The army was reformed, greater liberty was allowed to the landed gentry, government debts were paid up, and the poll-tax for the serfs lessened; but her paramour, Biron, having determined to govern the nation as well as the empress, a sudden and deplorable change ensued. This man, a blood-thirsty and avaricious wretch, established something like a reign of terror through the land. He is said to have banished not less than 20,000 persons to Siberia; numbers were knouted, had their tongues cut out, or were broken alive on the wheel. Eleven thousand perished in this way. Prince Basil Dolgoruki, and others of his family, suffered the ignominy of the scaffold. At length the health of the empress gave way. She died on October 28, 1740, and left the throne to her grand-nephew, Ivan, with Biron as regent. See RUSSIA and BIRON.

ANNALS. These were at first books which contained a record, in chronological order, of the principal events occurring in one or more years. The name is derived from the oldest historical documents of the Romans, the *Annales Pontificum*, or *Annales Maximi*, the duty of drawing up which devolved upon the *Pontifex Maximus;* but these were all destroyed by the Gauls at the sack of Rome, some hundreds of years before the time of Christ. After the second Punic War, A. similar to the former ones were composed, not, however, by the priests, but by educated members of the Roman laity, such as Fabius Pictor, Calpurnius Piso, &c. At a still later period, the term was applied to any historical work that followed the order of time in its narrations, separating them off into single years—as, for instance, the *Annals* of Tacitus.

ANNAMABOE′, a small seaport town, protected by a strong British fort, on the gold coast of Africa, in lat. 5° 5′ N., long. 1° 5′ W., 10 miles east of Cape Coast Castle. In 1807, the inhabitants took part with the Fantees against the Ashantees, in consequence of which the town was attacked by an overwhelming force of the latter, and most of the inhabitants were slain. There is little trade in anything but gold. The present population is between 4000 and 5000.

ANNAN, a seaport, and royal and parliamentary burgh, in the county of Dumfries, on the river of the same name, near its entrance into the Solway Firth. It is neat and well built; among the chief industries are tanning and bacon-curing. The river, which affords excellent salmon-fishing, is spanned by a bridge of three arches, and is navigable to within half a mile of the town for vessels of 250 tons; while considerably larger vessels can enter the mouth of the river, half a mile below. There is regular communication by steamers with Liverpool and Whitehaven; and the Glasgow and Southwestern and Caledonian Railways connect the town with Edinburgh, Glasgow, and Carlisle. The burgh unites with Dumfries, &c., in returning one member to parliament. Pop. in 1881, 3366.

ANNANDALE. See DUMFRIESSHIRE.

ANNA′POLIS, a seaport of Nova Scotia, in lat. 44° 40′ N. Pop. (1871) 2127. It stands on a river of the same name that runs into the Bay of Fundy. Its harbor is excellent, though somewhat difficult of access. A. is the oldest European settlement to the north of the Gulf of Mexico, having been established, in 1604, by the French as the capital of their province of Acadia, under the name of Port Royal. Acadia having been conquered by the English in 1710, and ceded by the French in 1713, Port Royal changed its name in honor of Queen Anne, continuing to be the seat of government, till, in 1750, it was superseded by the newly founded city of Halifax on the outside coast of the peninsula—the new capital, with its better position and superior haven, having diverted most of the trade of the place. Since then, A. has rather decayed than otherwise; and it would have done so more decidedly, had not its river been navigable for boats during nearly the whole of its course of 70 miles.

ANNAPOLIS, a city and port of entry, founded in 1649, the capital of Maryland, U.S., and of the county of Anne Arundel. It stands on the south bank of the river Severn, 2 miles from its entrance into Chesapeake Bay, and 37 miles E. by N. of Washington, 30 miles S. by E. of Baltimore—lat. 38° 58′ 50″ N., long. 76° 29′ W. The A. and Elkridge Railway, 21 miles long, connects the port with Baltimore and Washington. A. contains an imposing state-house, a bank, and six churches. It is the seat of St. John's College, and a naval academy, established in 1845, supported by the U.S. government. Three newspapers are supported by the citizens. Pop. (1870) 5744; (1880) 7000.

ANN ARBOR, a flourishing city of Michigan, capital of the county Washtenaw, on the Huron river and Michigan Central Railway, 38 miles west of Detroit. The state university, founded 1837, is attended by nearly 1000 students. It possesses a library of 9000 volumes, an astronomical observatory, and a capital chemical laboratory. The three colleges, literary, law, and medical, are well attended. The city has an active trade, and contains manufactories of wool, iron, ploughs, and flour. There are in it 10 churches and 6 school-houses; also 5 mineral springs, a hydropathic establishment, and 4 weekly papers. Pop. (1870) 7363; (1880) 7849.

A′NNATES, or FIRST-FRUITS, in the ecclesiastical law of England, means the value of every spiritual living for a whole year (hence the name from the Latin word *annus*, a year), which the Pope, claiming the disposition of every spiritual benefice within Christendom, reserved out of every living. This impost was at first only levied from persons appointed to bishopries; but it was afterwards extended to the inferior clergy. The value of these A. was calculated according to a rate made under the direction of Pope Innocent IV. (1253 A.D.), but which was afterwards increased by Pope Nicholas III. (1292 A.D.). The valuation of Pope Nicholas is still preserved in the Exchequer. This papal exaction was abolished by the act 25 Henry VIII. c. 20, and by an act passed in the following year of the same reign (26 Henry VIII. c. 3), the right to A. or First Fruits was annexed to the crown. The various statutes subsequently passed on this subject have all been consolidated by an act (the 1 Vict. c. 20), regulating the collection of the moneys so levied. See FIRST FRUITS, QUEEN ANNE'S BOUNTY.

ANNATTO. See ARNOTTO.

ANNE OF AUSTRIA, daughter of Philip II. of Spain, was born in 1602, and in 1615 became the wife of Louis XIII. of France. The marriage was so far from being a happy one, that the royal pair lived for 23 years in a state of virtual separation—a result due chiefly to the influence of Cardinal Richelieu, whose fixed determination to humble the House of Austria, led him to spare no means for alienating the affection of Louis from his queen, by representing her as ever involved in the most dangerous conspiracies against his authority. The naturally grave and phlegmatic disposition of the queen was not calculated to counteract the hostile influence of the great minister. On the death of the king in 1643, A. became queen-regent, and evinced her discernment by choosing as her minister Cardinal Mazarin, by whose able management the young king (Louis XIV.) came, on attaining his majority, into possession of a throne firmly established on the ruins of contending parties. The character of A. had much influence in moulding that of her son. She displayed the same cold and haughty temper, combined with the power to charm by a condescending grace, the same love of pomp and power, and the same skill in the choice of able instruments, thus compensating for the want of genuine personal greatness. She died in 1666. Two curious personal peculiarities of this queen are mentioned by biographers—her antipathy to roses, so strong that while passionately fond of flowers and perfumes, she could not endure even the picture of a rose; and the extraordinary delicacy of her skin, which made Mazarin remark, that 'if her majesty were condemned to the infernal regions, her hell would be to sleep in brown hollands.'

ANNE, Queen of Great Britain and Ireland, and the last British sovereign of the House of Stuart, was born at Twickenham, near London, on 6th February 1664. She was the second daughter of James II. of England, and VII. of Scotland (who at the time of her birth was Duke of York), by his first wife, Anne Hyde, the daughter of the famous Clarendon. When she was about seven years of age, her mother died; and her father soon after professed himself a member of the Church of Rome; but he permitted his daughters to be educated in the principles of the Church of England, to which A. always retained an ardent if not a very enlightened attachment—seldom manifesting, in the whole course of her life, so much resolution and independence of mind, as in her resistance to the attempts of her father, after his accession to the throne, to induce her to join the Church of Rome, accompanied, as these were, with the offer that she should be preferred in the succession to her sister Mary. To advance his own popularity, her father gave her in marriage, in 1684, to Prince George of Denmark, brother of Christian V., an indolent and good-natured man, who concerned himself little about public affairs, and was endowed with no capacity for taking part in them. A.'s own weakness of character and that of her husband gave opportunity to Lady Churchill, afterwards Duchess of Marlborough, her early playfellow, to acquire an influence over her, which, during many years, was almost supreme and absolute. During the reign of her father, A. lived in retirement, taking no part in politics. On the landing of the Prince of Orange, she seems at first to have hesitated, and even to have been inclined to adhere to the cause of her father, whose favorite daughter she was; but Lord Churchill had made up his mind to an opposite course, and his wife induced the princess to adopt it.

She consented to the act by which the throne was secured to the

Prince of Orange in the event of his surviving her sister Mary; but quarrelled with her sister about questions of etiquette, and was afterwards drawn into intrigues in which the Churchills were engaged, for the restoration of her father, or to secure the succession of the throne to his son. She even entered into a secret correspondence with her father. She was herself childless when, on the death of William III., on 8th March 1702, she succeeded to the throne. She bore, indeed, seventeen children; but only one, the Duke of Gloucester, survived infancy, and he died in 1700, at the age of 11. The influence of Marlborough and his wife was most powerfully felt in all public affairs during the greater part of her reign. The strife of parties was extremely violent, and political complications were increased by the queen's anxiety to secure the succession for her brother. In so far as she had any political principles, they were opposed to that constitutional liberty of which her own occupancy of the throne was a sort of symbol, and favorable to absolute government and the assertion of royal prerogative according to the traditions of her family. These principles and her family attachment, tended to alienate her from the Marlboroughs, whose policy, from the time of her accession, had become adverse to Jacobitism, and who now, along with Godolphin were at the head of the Whig party. The duchess also offended the queen by presuming too boldly and haughtily upon the power which she had so long possessed. A. found a new favorite in Mrs. Masham, a relation of the duchess, whom she herself had introduced into the royal household. To Mrs. Masham's influence the change of government in 1710 was in a great measure owing, when the Whigs were cast out, and the Tories came into office, Harley (afterwards Earl of Oxford) and St. John (Lord Bolingbroke) becoming the leaders of the ministry. But, although concurring more or less in the queen's design to secure the succession of the throne to her brother, the new ministers had quarrels among themselves which prevented its successful prosecution, and it oozed out sufficiently to alarm the nation, and to alienate many of their political supporters. A dispute between Oxford and Mrs. Masham, carried on for hours in the queen's presence, and which terminated in her demanding his instant resignation, seems to have brought on the attack of apoplexy of which she died 1st August 1714. The Elector of Hanover succeeded her as George I.—The public events of her reign belong to the history of Britain; but the union of England and Scotland, in 1707, may be mentioned in its personal relation to herself, as she was the last sovereign who reigned over these as separate kingdoms, and the first sovereign styled of Great Britain.—Queen A. was of middle size, and comely, though not beautiful. She was virtuous, conscientious, and affectionate, more worthy of esteem as a woman, than of admiration as a queen. Her reign is often mentioned as a period rendered illustrious by some of the greatest names, both in literature and science, which her country has ever produced; but literature and science owed little to her active encouragement.

ANNEA'LING is the process of tempering resorted to in the manufacture of glass and the preparation of several of the metals, whereby these substances acquire a hardness combined with tenacity which renders them much stronger, and consequently more durable. In the making of glass vessels by the glass-blower, they are of course quickly reduced in temperature whilst the fused glass is being modelled into the desired shape. The atoms of the glass thus rapidly compelled to assume a position, do not seem to be properly and firmly arranged together, and the vessel is very liable to be broken, either by a slight but smart blow, or a sudden increase or decrease in temperature. This brittleness is very observable in the *lacrymæ vitreæ*, or glass tears, known as *Prince Rupert's Drops*, obtained by allowing molten glass to fall into water, when the glass forms pear-shaped drops, which are so brittle, that if they be scratched with a file or the end be broken off, the whole bursts asunder and falls down into a fine powder of glass. The same brittleness is exhibited in *Bologna jars*, or *phials* which are small and very thick in the glass; and yet, if a minute angular fragment of any hard substance be dropped into the jar, the latter flies to pieces.

In the A. of glass vessels, they are arranged in iron trays, and placed in a long oven, where they are gradually raised in temperature to near their fusing-point, by the trays being drawn along to the hottest part of the oven; and thereafter, the trays, with their contents, are very slowly drawn into a cooler and cooler part, till they become cold. The A. operation generally takes twelve hours for small articles such as wine-glasses; but days, and even a week or two, are required to anneal completely large vessels. Many articles of glass, such as tubes for steam-gauges, lamp-glasses, &c., are annealed by being immersed in cold water, which is very gradually raised to its boiling-point, and thereafter cooled.

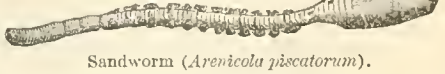
The metals are often subjected to the process of A. When medals are repeatedly struck by the die-stamper, the gold or other metal, by the concussion, becomes brittle, and requires to be now and again heated and annealed. In wire-drawing, also, the metal becomes so hard and brittle, that it requires A. to prevent its breaking into short lengths. Boiler-plates, which have been drawn out by rolling, require to be annealed before they are riveted together. The brazier, in hammering out copper and brass vessels, must stop now and again, and anneal the metal. Articles of tin, lead, and zinc can be annealed in boiling water. The tempering of steel is just a process of A. The steel is placed in an oil-bath, or surrounded by a metallic mixture which has a low fusing-point; and according to the temperature to which it is subjected, a steel with various degress of softness and strength is obtained. Parke's table of metallic mixtures capable of being used in the tempering or A. of instruments made from steel, is as follows:

	Alloy. Lead.		Tin.		Fusing-point °F.
Lancets	7	parts	4	parts	420°
Razors	8	"	4	"	442
Penknives	8½	"	4	"	450
" large	10	"	4	"	470
Scissors, shears	14	"	4	"	490
Axes, plane irons	19	"	4	"	590
Table-knives	30	"	4	"	530
Watch-springs, swords	48	"	4	"	550
Large springs, augers	100	"	4	"	558

The theory of A. is very imperfectly understood. A certain re-arrangement of the atoms of the glass or metal no doubt takes place, and an absorption of heat occurs. It is possible that as the crystalline structure is indicative of brittleness, and the fibrous texture characteristic of strength, that the passage of glass or metal from a brittle to a non-brittle material may be due to the development of a fibrous structure, where a crystalline one was originally present.

ANNECY, a town of the dep. of Haute Savoie, France, at the north-western extremity of the Lake of Annecy, and 21 miles south from Geneva. The Lake of Annecy is 1426 feet above the sea, and is surrounded by magnificent mountain scenery. It is about 9 miles long and 2 miles broad. Its waters flow by the Fieran to the Rhone. In the 12th c., A. was called *Anneciacum novum* to distinguish it from Old A., *Anneciacum vetus*, which occupied the slopes of a neighboring hill, and was a place of some consequence in the times of the Romans. In the earlier part of the middle ages, A. belonged to the Counts of Geneva, and on the extinction of that House, it passed to the House of Savoy, in whose possession it remained, except for a brief period under the French Empire, until the transference of Savoy to France in 1860. It has manufactures of linens, cotton-yarn, glass, sulphuric acid, and steel-wares. Its linen bleachfields have subsisted since 1650. The town is clean, and has an air of respectable antiquity. The shops in many of the streets are under arcades. The most remarkable buildings are the château, once the residence of the family of Genevois-Nemours, the old bishop's palace, the cathedral, and the modern church of St. Francis, the latter of which boasts of possessing the relics of St. Francis of Sales and La Mère Chantal. Pop. (1876) 10,630.

ANNE'LIDA (Lat. *annulus*, a ring), a class of Worms (q. v.; and for new classification of the orders see under *Vermes* in ZOOLOGY). They have a more or less elongated body, which is always composed of numerous rings. The first of these rings assumes, in most of them, the characters of a head, but in some there is no proper head. They have no articulated limbs, but most of them are provided with bristles and hairs, often in numerous bundles, which are of use to them in locomotion; some, which want these, are furnished with suckers at the extremities, and employ them for this purpose; some remain fixed in one place. Their bodies are always soft, and without external or internal skeleton; but some of them form for themselves a calcareous covering by exudation, others form coverings partly by exudation



Sandworm (*Arenicola piscatorum*).

and partly by agglutination. Their blood is generally red, but not from red corpuscles, as in the vertebrate animals; sometimes it is greenish or yellowish. Their nervous system is simple. Many of them have eyes, and many have tentacula. Most of them live in water, and of these the greater part inhabit the sea. Those who live in water breathe by gills, which are variously formed and placed; some which are terrestrial, as earthworms, have, instead of gills, numerous small respiratory sacs. They are all hermaphrodite; most of them, however, requiring mutual fecundation, and most of them are oviparous. They feed in general upon other animals, and some of them live by sucking blood. They are now divided into four orders: 1. *Dorsibranchiata*, having gill-tufts disposed regularly along the body, and composed of animals of comparatively active habits; 2. *Tubicolæ*, having gill-tufts near the head, and provided

with shelly or other coverings; 3. *Terricolæ*, destitute of all external appendages except minute bristles, and breathing by respiratory sacs; 4. *Suctoria*, destitute even of bristles, and provided with suckers.

ANNOBON, or ANNABON, an island in the Gulf of Guinea, about 1½ degrees south of the equator, and belonging to Spain. Its basaltic, trachytic, and volcanic mountains render A. picturesque. It has an area of 6 square miles, and a pop. of about 3000.

ANNONAY (anc. *Annonœum* or *Annoniacum*), a town of the dep. of Ardèche, France, at the junction of the Deaume with the Cance, which unite in the center of the town, 37 miles south from Lyon. It is an active and prosperous manufacturing town, the chief manufacture being that of paper, of which 300,000 reams are produced annually. There are also manufactures of glove-leather, mostly from kid skins, and of silk and cotton twist, and woollen cloth. The paper-mills of A. were established by the father of the celebrated aëronauts, Montgolfier (q. v.), who were born here, and to whom there is a monument in the Grande Place. The situation of the town is picturesque and remarkable; the houses are placed among rocks, and some of the streets are very steep. A large quantity of silk is produced in the neighborhood. Pop. (1876) 13,738.

A'NNUAL, in Botany, a term employed to denote that the duration of the life of a plant is limited to a single year; within which the germination of the seed, all the functions of vegetation, the ripening of new seed, and the death of the plant, are included. The whole duration of life in the plants thus designated is indeed generally much less than a year, and in temperate and cold climates, falls within the brief period of the summer months. They, as well as the plants generally called biennial, produce flowers and fruit only once. Some species are generally A., and others generally biennial; but whether an individual plant is A. or biennial, often depends upon the accidental circumstance of the season at which the seed germinates, and may therefore be artificially determined by the time of sowing. Peculiar circumstances also sometimes convert A. into biennial, or even perennial plants; and those which are mere annuals in one climate, are perennial, or even shrubby, in another, of which the Castor-oil plant affords a notable example. Most kinds of corn are the produce of A. grasses; some of which, however, as wheat, in certain circumstances, prove of longer duration. The *annuals* cultivated in our flower-gardens are very numerous; and many species, both native and foreign, are among our most beautiful flowers.

A'NNUALS, the name given to a class of pleasant and graceful publications, which for some years enjoyed an extraordinary amount of public favor, intended for Christmas, New-year, and Birthday presents, in imitation of the Gift-books so popular among the Germans. They were illustrated by exquisitely engraved prints, from paintings by artists of the highest talent, and contained prose and poetry by most of the best writers of the day. The first of them, the *Forget-me-not*, edited by Frederick Shoberl, was begun in London in 1822. The idea, and even the title were adopted from Germany by the Messrs. Ackermann, the London publishers. The following year, two others made their appearance—*Friendship's Offering*, published by Smith and Elder, which had for successive editors, Mr. T. K. Hervey, Mr. Pote, Mr. Thomas Pringle, Mr. W. H. Ainsworth, and Mr. Leitch Ritchie; and the *Graces*, containing a series of elegant poems on the Months by the Rev. Dr. Croly. All three, in addition to their literary and pictorial contents, had at first the blank paper for memoranda, cash accounts, &c., which were customary in the Gift Pocket-books of previous times. The *Literary Souvenir*, commenced in 1824 by Mr. Alaric A. Watts, was the first to discard these, and to exhibit a vast improvement on this class of embellished works. Thenceforth, the several publishers vied with each other in their efforts to render their respective A., every succeeding year, more and more attractive. The *Literary Souvenir* was followed by the *Amulet*, started by Mr. S. C. Hall, and edited by his wife; the *Winter's Wreath*, a provincial annual, and the *Keepsake*, the latter commenced in 1827 by Mr. Charles Heath, an eminent engraver. Up to this time, the price of all the A. was 12*s.* each: the *Keepsake*, however, was published at a guinea. Its first editor was Mr. W. H. Ainsworth. The following year, the editorship was offered to Sir Walter Scott, with a salary of £800, and payment besides for his contributions to its pages, but was declined by him. It was then placed under the charge of Mr. F. M. Reynolds, who continued to superintend it for many years.

The *Keepsake* always maintained a high aristocratic character, the contributors preferred being those who could boast a title. In 1840, it came out under the editorship of Lady Emmeline Stuart Wortley. It was afterwards edited by the Countess of Blessington. So popular did A. become, that in 1829 no fewer than seventeen were published. In 1840, the number had dwindled to nine. The *Book of Beauty*, long one the best of the series, was begun in 1833 by Mr. Charles Heath. The first volume was written by Miss Landon (L. E. L.), the engravings being principally after drawings by Frank Stone. The volume for 1834 was placed under the editorship of the Countess of Blessington, who conducted it to the close of her life. Mr. Heath had also the *Picturesque Annual* and the *Children of the Nobility*—the latter commenced in 1838. The *Juvenile Album*, an annual for children, was published by the Messrs. Ackermann. Scientific A. also made their appearance, and the musical world had its *Musical Bijou*. Thomas Hood started the *Comic Annual*; and among other popular publications of the class were Fisher's *Drawing-room Scrap-book*, edited at first by Miss Landon, afterwards by Mrs. Howitt, and latterly by the Honorable Mrs. Norton; and Fisher's *Juvenile Scrap-book*, edited by Mrs. Ellis; the *Oriental Annual*, the *Historical Annual*, and the *Gift* and *Token*, American productions. At first, the A. were all bound up in tinted paper, and enclosed in a case; but competition produced a great improvement in their external appearance, as well as in their inside attractions. Paper gave place to silk; then followed morocco bindings, and afterwards velvet. The sums of money expended on the several departments were enormous. Mr. Heath's outlay for the literary portion alone of the second volume of the *Keepsake* amounted to no less than £1600. Of this sum, Sir Walter Scott received £500 for the liberty of printing in it his juvenile drama of the *House of Aspen*, *Aunt Margaret's Mirror*, and two other little tales. To many engravers, the illustrations formed almost their sole employment. Sums varying from 20 to 150 guineas were paid to artists for the loan of pictures for engravings, of the size of 4 inches by 3; and engravers frequently received 150 guineas for the production of one plate. For several years, nearly £100,000 per annum was expended on the production of the A., and 150,000 copies of them were yearly sold. The sale of the *Forget-me-not* alone was at one time 20,000 copies. In their most flourishing period, a calculation of their expenses and profits was made, which may be here quoted. For 150,000 volumes, including the guinea-books, of which there were always two or three, the public paid about £90,000, thus distributed: Authors and editors, £6000; painters, £3000; engravers, £12,000; copperplate printers, £4000; printers, £3500; paper-makers, £5500; binders, £9000; silk manufacturers and leather-sellers, £4000; advertising, &c., £2600; incidental expenses, £1000; publishers' profits, £10,000; retail booksellers' profits, £30,000—Total, £90,000.

After 1840, the demand for the A. began to decline. At the best there had been a sickly sentimentalism in the bulk of their articles; and at all events, this class of works had been mainly addressed to the refined and affluent. Better tastes in literature now began to prevail, and there was a feeling that A. had had their day. Deserted by public favor, the character both of their engravings and their literary contents became greatly deteriorated, and they ceased to have any attraction, either as literary productions or works of art. Publishers no longer found them safe speculations, and gradually discontinued them. They dropped out, one by one, like spent stars from the literary firmament. The *Literary Souvenir* had been discontinued in 1834, after the publication of ten volumes. The *Forget-me-not*, the first in the field, saw its 22d year. The *Book of Beauty* and the *Keepsake* (of 1856) were the last of their race. Innumerable *Christmas Annuals* are now published; but these are cheap collections of tales and poems, illustrated with wood-cuts. They are accordingly quite unlike the old annuals, and are similar to the extra Christmas numbers issued by many of the monthly magazines.

ANNUAL REGISTER. The first volume of the useful work which bears this name appeared in 1759. Various publications of a similar character had previously existed, such as Boyer's *Political State of Europe*, which was published in monthly numbers and yearly volumes from 1711 to 1739; and the *Historical Register*, a quarterly publication, begun in 1716, and concluded in 1738. The *A. R.* differed from these in being published once a year, in containing a more full and able historical narrative, and in the addition of a literary and miscellaneous department, including notices of new books. The undertaking was projected by Robert Dodsley the bookseller, assisted by Edmund Burke, who for some years wrote the historical narrative, and assisted to some extent in the preparation of the *Register* during most of the subsequent part of his life. Indexes to the work have been published at various periods, and the work still goes on under the publishing care of Messrs. Rivington. A rival work, entitled *The New A. R.*, was started in 1781 by Dr. Kippis. It was edited after his death by Dr. Morgan, and came to a close in 1825. The *Edinburgh A. R.* was commenced in 1808 and terminated in 1827. The historical narrative was for some years written by Sir Walter Scott, and afterwards, for a considerable time, by Southey. A similar work was commenced at Paris in 1818 under the title of *Annuaire Historique*, and continued till 1849. The earlier volumes were compiled with much care, but latterly the work fell off. Its place was supplied by the *Annuaire des Deux Mondes*, a publication connected with the well-known review of that name. The *American A. R.* is published at New York.

ANNU'ITY, from the Latin *annus*, a year, is a sum of money paid annually. The term, in its full meaning, expresses an obligation on one party to pay, and a right in another to receive the amount. The different kinds of annuities that may exist are as various as the conditions and fancies of those concerned in them; and it is impossible to define them all. An A. may be for the life of any person, however long that may be, becoming extinguished only by his death. It may be perpetual, so that as each enjoyer of it dies, his heirs may succeed to it. It may be on the life of the survivor of any number of persons—for instance, a father may leave to his five daughters an A. of £500 a year from his estate, to be enjoyed by the latest survivor, so that while the five are alive, they have £100 each; after the first death among them, the lapsed share is distributed among the survivors, giving them £125 each; and so on, the last survivor enjoying the whole £500. On the other hand, each might have a separate A. terminating at her death; and again, instead of either of these simple arrangements, there might be, and often is, a more complex adjustment, giving the survivors on each death a certain proportion only of the deceased's A. An A. may begin immediately, and stop on a contingency, such as the death of a person to whom the annuitant is heir. It may be 'deferred,' so as to begin to be payable only after the lapse of so many years; and then it may either be payable absolutely in perpetuity, or for a given number of years, or it may be payable to an annuitant only for the remaining years of his life, if he survive the contingency.

It will thus be seen that there is infinite variety in the nature of annuities, and consequently, in the calculations regarding them. The fixed elements of such calculations, independently of this variety, are in themselves double, being vital statistics, and the profit or interest of money. As to the former, they can only apply, of course, to the adjustment of annuities on a large scale. If a person should sell a single A.—that is to say, engage for a sum down to pay a certain person an A. for life—no study of vital statistics could make his bargain other than a chance; and though he went on the most approved tables, it might occur either that the annuitant dies immediately, leaving the whole purchase-money as his profit, or that the annuitant lives to extreme old age, and renders him a great loser by the bargain. But on a large, and especially on a national scale, the rate of mortality and the value of life may be so nicely rendered in statistics, that a market may be opened for the purchase and sale of annuities at their exact value—that is to say, at such a rate that the sum paid in from time to time by persons purchasing annuities, shall just serve to pay each annuitant's annual claim. Such vital statistics, however, can only be obtained through a very accurate and long continued Registration of Births, Deaths, and Marriages (q. v.); and it is known that the government having adjusted the price of annuities by the celebrated Northampton Tables, contracted a losing bargain with their annuitants as a body, and, without being conscious of it until afterwards, sacrificed a considerable amount of public money.

The second element, besides vital statistics, in the calculation of annuities, is the profit or interest of money. If this did not require to be considered, an A. of £1 a year for ten years would just cost £10. But while paying the A., the person who has engaged for it is drawing the interest of the money. If he sold an A. of £1 a year for ten years for £10, he would be drawing the interest of £10 for the first year, £9 for the second, and so on; and the annuitant's bargain would be to a like extent disadvantageous. As the interest of money may be various, so may this element of the calculation of an A.; and to calculate it with reference to future indefinite variations, is of course impossible. It will be seen at once that when the variety of kinds of A. have to be adjusted to different rates of profit, an immense field is opened for calculation. It is, in fact, a province of algebraic science in which several men have achieved reputations.

The interest, as it is termed, of the national debt is virtually a multitude of perpetual annuities. In a country where there is so much superabundant wealth, there is so vast an amount of capital for which people only want interest, that although the lenders of the money are not repaid by the government, yet when any one has invested in the funds, if he wants his money back, he is sure to find a person to take his place at something near to the price paid by him. This would not be the case were the quantity of these annuities in the market disproportioned to the number desiring to invest in them, and hence it is that when there is depression of trade, and money wanted to meet obligations, the funds fall. The government have the largest field of operation, and therefore it is natural to infer that their annuities are more closely adjusted to their actual value than those of insurance companies and other parties dealing in annuities can be. It may be mentioned, however, that, for the encouragement of the working classes to save and provide for old age and contingencies, government, through the savings' banks, grants small annuities on terms advantageous to the purchasers—that is, at less than their market value (see SAVINGS' BANKS.

Many complicated sets of tables have been prepared to facilitate the calculation of annuities. The latest known to us are the *Commutation Tables for Joint Annuities and Survivorship Assurances, based on the Carlisle Mortality at 3, 3½, 4, 5, and 6 per cent.*, by David Chisholm, 2 vols., royal 8vo, 1858. The calculations are brought out in decimals. Taking the simplest of these tables—namely, those containing the value of an A. of £1, payable at the end of the first year, and thereafter annually during life—we find the following results, commuting the decimals into fractional money through Mr. Chisholm's decimal tables:

VALUE OF ANNUITY OF £1.

Age.	£	s.	d.	Age.	£	s.	d.
5	16	11	9½	45	12	12	11½
10	16	13	4½	50	11	14	2½
15	16	4	6½	55	10	7	11½
20	15	16	4½	60	8	18	9½
25	15	6	1	65	7	17	3¾
30	14	14	5	70	6	6	8½
35	14	2	6½	75	4	19	9½
40	13	7	9½	80	4	2	10¾

In political economy, annuities come within the class of payments which tend rather to consumption than to accumulation or reproduction. As the means of attaining a legitimate object, the establishment of an A. may be an advantage to the community in benefiting some individual member of it. For instance, a man is naturally extravagant—he would spend his heritage immediately, and come to want, if it were paid to him in capital. It is therefore vested in an A.; the man is kept in comfort, and society is not burdened with a needy member. Women are apt to mismanage by false investments or otherwise any capital sums left at their disposal, and therefore it is often advantageous to give them an equivalent in an A. In serving, however, these its legitimate objects, it will be seen that the money so spent is not in its character reproductive. People do save capital out of annuities, but, as a general rule, the object and effect of annuities are in the direction of consumption, as contrasted with accumulation. This is often overlooked in settlements, especially by men who have themselves been accumulators. The consumptive effect of an A. will depend much on its coming out of fixed or fluctuating property. Take, as an instance of the former, a landed estate. If the clear rent be paid on annuities, the estate will not be improved, and it will be stagnant in the proportion so paid. If, out of a thousand a year, nine hundred be thus paid, the owner out of his remainder of a hundred, is not likely to accumulate sufficient capital to improve the estate and double its value. But fluctuating property may not only be rendered stagnant, but may be destroyed by the burden of injudicious annuities. This is frequently exemplified in disposing of the profits of a business. Different members of a family are portioned off upon it, as if it were a fixed permanent estate; and consequently, there is not a sufficient balance left to induce any one to give his time and energies to the management of the business.

ANNU'ITY, in the law of England, is the right to the yearly payment of a certain sum of money, which is charged upon the person or personal estate of the individual bound to pay it. If it is charged upon real estate, the burden is called a rent, or rent-charge, and not an A. An A. may be created for a term of years, or for the life or lives of any persons named, or in perpetuity; and in the last case the A. is reckoned among incorporeal hereditaments; because, although the security is personal only, yet the A. may descend in the same manner as real estate. In 1854, the old statutes relating to annuities were repealed by 17 and 18 Vict. c. 90, and enrolment in Chancery of annuity deeds is no longer necessary to give them validity. But by another statute of 18 and 19 Vict. c. 15, s. 12, any A. or rent-charge granted after 1855, otherwise than by marriage settlement for one or more life or lives, or for any term of years or greater estate, determinable on one or more life or lives, shall not effect any lands, tenements, or hereditaments as to purchasers, mortgagees, or creditors, unless and until a memorandum or minute of the name, place of abode, title, trade, or profession of the person whose estate is intended to be effected thereby, and the date of the deed, bond, instrument, or assurance whereby the A. or rent-charge is granted, and the annual sum or sums to be paid, shall be left with the senior Master of the Common Pleas at Westminster, who enters the particulars in a book of alphabetical names. A fee of 2*s.* 6*d.* is paid to the officer; and any person may search the register for a fee of 1*s.* And when the A. is satisfied, and ceases to affect the lands, a memorandum is in like manner entered in this register (23 and 24 Vict. c. 115, s. 2). But this act does not require the registry of annuities or rent-charges given by will.

Many persons who have a small capital, and are desirous of obtaining the largest life income, may buy an A. from an insurance office, and government grants these in connection with the post-office.

An important feature of the law relating to annuities is, that they are considered as accruing from day to day, so that, whatever be the term or terms of payment, whether yearly, half yearly, quarterly, or monthly, whenever the annuitant dies, the payment of the A. is counted up to the day of the death, and the same remedy exists for recovering payment of the intervening days between the terms, as if the termly payment had then arrived.

A large number of annuities are created and kept alive by statutes relating to the public stocks, which are nothing else but annuities, not payable out of real estate, but granted to the holder and his heirs, and transferable by a short and easy method. The stocks in the funds are merely rights to receive certain annuities by dividends as they become due, subject to the right of the government to redeem such annuities on payment of a stipulated sum.

In Scotch law, an A., as such, may be charged on real estate as well as on personalty. In that system, it has been simply defined to be a right to a yearly payment in money; and it may be created either by the payment of the sum of money in the form of a purchase, or it may be secured over land, in which case the creditor, in the event of default of his A., may attach the land charged, claiming in his action for recovery a capital sum out of the land, sufficient to produce an annual interest equal to the A., which annual interest is paid until the expiration of the A., when the capital sum is restored to the debtor. The instrument by which, in Scotland, the A. is constituted in either of the above forms, is called a Bond of A.; and before the repeal of the usury laws (by a recent statute, 17 and 18 Vict. c. 90), this form of deed was frequently resorted to as a means of securing loans where a high rate of interest was charged; and the same practice prevailed in England. But the last-mentioned act renders all such expedients now unnecessary.

ANNU'ITY-TAX, a local impost for the payment of the salaries of the Established clergy of the city of Edinburgh. It was first established on a limited scale by an act of the year 1661; and was extended in its sphere of operation by an act of the legislature as lately as 1809. It amounted at one time to 6 per cent. on the rents of houses and shops within the royalty. It was a peculiarity of this tax that the members of 'the College of Justice,' including the lawyer class generally, enjoyed an exemption from it, as a relic of an ancient privilege by which they were induced to reside and hold the courts of law in Edinburgh. The tax was reduced in 1860; and under an act passed in 1870, it was redeemed by payment of £56,500 by the Corporation to the Edinburgh Ecclesiastical Commissioners.

A'NNULET (Lat. *annulus*, correctly *anulus*, a ring), a term in Architecture for a small fillet or band which frequently surrounds a column, &c. The A. is several times repeated in the moulding which surmounts the shaft of a Doric pillar.—A., a ring, a charge in Heraldry.

ANNULOIDA, ANNULOSA. See Worms.

ANNUNCIA'DA. 1. The religious Order of the Heavenly Annunciation, or of the Nuns of the Annunciation of Mary, was instituted by Victoria Fornare at Genoa in 1682, after the rule of St. Augustine. All the convents of the order in France, Germany, and the Netherlands have disappeared since the French Revolution. Some still exist in Italy. 2. Another Order of the Annunciation, or of Nuns of Mary's Announcement or the Ten Virtues, was endowed by John of Valois at Bourges in 1501, after its separation from Louis XII. In 1514, it was placed under the authority of the Franciscans. This order, which extended to fifty convents for the reception of poor gentlewomen, was broken up at the Revolution. 3. The Order of Knights of the Annunciation in Savoy (*Ordine Suprema dell' Annunciata*), known originally as the Order of the Neck-chain or Collar, was instituted in 1360 by Amadeus VI., Duke of Savoy. It received statutes from Amadeus VIII. in 1409; was renewed in 1518 under the name of the Holy Annunciation; and in 1720 was raised by Victor Amadeus to be the first order of the kingdom of Savoy. The king is always grandmaster. The knights who, since 1720, are not limited in number, must be of high rank, and already admitted to the orders of St. Mauritius and St. Lazarus. They compose only one class. The decoration is a gold medal, on which is represented the Annunciation, surrounded by love-knots. It is usually worn suspended by a simple gold chain; but the proper collar or chain of the order is composed alternately of love-knots and roses. On the roses are engraved the letters F. E. R. T., which some interpret *Fortitudo ejus Rhodum tenuit*, in allusion to the defence of Rhodes by Amadeus I., and which others hold to signify, *Frappes, entres, rompes tous*. Since 1680, the knights wear on the left breast a star embroidered in gold. The four supreme officers of the order—the chancellor (always a bishop or archbishop), the secretary (usually the Minister of Foreign Affairs), the almoner (usually the king's first almoner), and the treasurer—wear the decoration round the neck, suspended by a sky-blue ribbon, accompanied by a star on the left breast. For details of costumes, &c., see Burke's *Book of Orders of Knighthood*, p. 250, *et. seq.*

Star of the Order of the Annunciation.

Decoration of the Order of the Annunciation.

A'NNUS DELIBERA'NDI, in Scotch law, was meant to signify the period of a year allowed to an heir to deliberate whether he would accept the inheritance with the burden of his predecessor's debts. The year commenced on the death of the ancestor, unless in the case of a posthumous heir, when the year ran from the birth of the heir himself. But by a recent act of parliament—the 21 and 22 Vict. c. 76, sec. 27—it is provided that all proceedings 'against an apparent heir on account of his ancestor's debt or obligation, for the purpose of attaching the ancestor's heritable estate, and actions of adjudication against such heir on account of his own debt or obligation, for the purpose of attaching such estate, may be insisted on at any time after the lapse of *six months* from the date of his becoming apparent heir (23 and 24 Vict. c. 143, s. 16; 31 and 32 Vict. c. 101, s. 61).

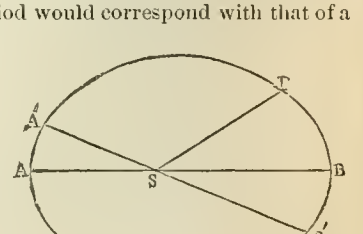
ANOBIUM. See Borer and Death-watch.

A'NODE [Gr. *ana*, upward, and (*h*)*odos*, a way], a term introduced into the science of electro-chemical decomposition (electrolysis) by Dr. Faraday to designate the positive pole, or that surface by which the galvanic current enters the body undergoing decomposition (electrolyte). The negative pole, or that surface by which the current leaves the electrolyte, is called in the same nomenclature the *cathode* [*kata*, downward, and (*h*)*odos*.] *Electrode* is the general term applied to either of these. The elements of electrolytes are called *ions* (*ion*, going). Such as go to the A. receive the name of *anions*, and those passing to the cathode, *cations*. Thus, in the decomposition of water by the passage into it of a galvanic current through two platinum plates, the water is the electrolyte; the platinum plate connected with the copper end of the battery is the A.; and the one connected with the zinc end, the cathode. The oxygen and hydrogen which are disengaged are the *ions;* the oxygen separating at the A. is the anion; and the hydrogen at the cathode, the cation. Anions and cations are more generally known under the name of electro-negative and electro-positive substances; but as these terms are considered by Dr. Faraday to imply certain supposed attractions for the positive or negative pole, the other terms have been employed by him to describe simply the part the substances play in electrical decomposition.

A'NODYNE (Gr. *a*, privative, and *odyne*, pain), a medicine given to assuage pain. Properly, the term is applied to medicines, such as opium, which act on the nervous system, so as to decrease sensibility and induce sleep.

ANOINTING. See Chrism, Coronation, Extreme Unction.

ANOMALI'STIC YEAR is the interval that elapses between two successive passages of the earth through its perihelion, or point of nearest approach to the sun. If the earth's orbit had a fixed position in space, this period would correspond with that of a sidereal revolution, or the time the earth takes after leaving any point of the heavens to return to it again; but the disturbing influence of the other planets causes the perihelion to advance slowly (11″·8 annually) in the direction of the earth's motion; so that the A. Y. is longer (4 minutes 39 seconds) than the sidereal. This will be better understood from the accompanying diagram, in which A′BB′ represents the elliptical orbit of the earth; S, the sun; A, the perihelion; and AB, the longer axis. When the earth, after leaving A, comes back to it again, after having completed a sidereal revolution, it finds the longer axis AB, and with it the whole ellipse, advanced to A′B′, and it has still to describe the arc of 11″·8 before it reaches its second perihelion A′. The length of the A. Y. is 365 days, 6 hours, 13 minutes, 49 seconds. It receives its name from the anomaly (q. v.).



Elliptical Orbit.

ANO'MALY (Gr. *anomalia*, irregularity), the angle measured at the sun between a planet in any point of its orbit and the last

perihelion. In the figure in the preceding article, if P be a planet, A′BB′ its orbit, S the sun, and A the perihelion, the angle ASP is the anomaly. It is so called because it was in it that the first irregularities of planetary motion was discovered. The anomaly was formerly measured from the aphelion, the opposite point of the ellipse; but from the fact that the aphelia of most of the comets lie beyond the range of observation, the perihelion is now taken as the point of departure for all planetary bodies.

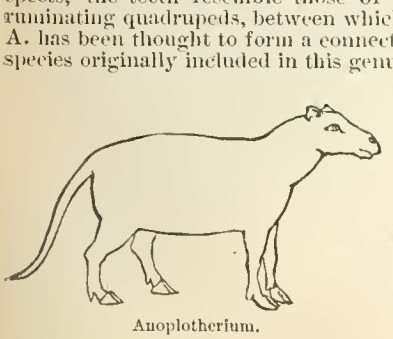
ANONA. See CUSTARD-APPLE.

ANONA′CEÆ, a natural order of Dicotyledonous or Exogenous plants, of which the type is the genus *Anona*. They are trees or shrubs, with alternate simple, generally entire leaves, destitute of stipules; flowers usually green or brown, axillary, solitary, or two or three together; the calyx of 3—4 persistent sepals; the corolla of 6 hypogynous leathery petals, in two rows. The stamens are generally numerous; the filaments short; the anthers adherent, turned outwards, and with a large 4-cornered *connective*. See STAMEN. The carpels are usually numerous, separate or cohering; the styles short; the stigmas simple; the ovules inverted. The fruit consists of distinct or united carpels, sometimes succulent; the seeds attached to the suture; their external covering brittle; the embryo minute, in the base of the hard albumen. —There are about 300 known species, mostly natives of tropical countries. They are generally aromatic and fragrant in all their parts, and some species are employed medicinally; the dry fruit of *Xylopia aromatica* is commonly used as pepper by the African negroes, and was formerly imported into Europe as ETHIOPIAN PEPPER or GUINEA PEPPER. The flowers of some species are of exquisite fragrance; others yield delicious fruits. See CUSTARD-APPLE and CHERIMOYER.

ANO′NYMOUS (Gr. nameless), a term applied to a book the author of which does not give his name; when an assumed name is given, the term PSEUDONYMOUS is used. Works of this class constitute one of the great difficulties of bibliography. French literature possesses an excellent *Dictionnaire des Ouvrages Anonymes et Pseudonymes* (2d ed., 4 vols. Par. 1822—1825) by Barbier, embracing the titles of about 24,000 works, with the names of those who are known or are assumed to be the authors. Mr Halkett, Keeper of the Advocates' Library, Edinburgh, commenced a similar work for English literature, which on his death in 1871, was continued by Mr. Laing, of the New College Library, Edinburgh.

In Great Britain, political articles are always A., as is also most of the periodical criticism; but on the other side of the Channel, this practice is far from common. It is generally admitted that anonymity secures the independence of the critic, and enables him to write with greater freedom, vigor, and power; but it is true that he often abuses his advantage, and gratifies, under the veil of the A., the worst passions of his nature. Perhaps the most intolerable abuse of anonymity is the anonymous letter. The miseries, anxieties, and terrors which this cowardly method of assailing people has occasioned, must excite against it the indignation and abhorrence of all honorable-minded men.

ANOPLOTHE′RIUM (from the Greek *a*, privative; *(h)oplon*, armor; and *therion*, a beast), a genus of extinct Pachydermatous quadrupeds (see PACHYDERMATA), established by Cuvier from bones occurring in great abundance in the gypsum strata of the Upper Eocene (q. v.) formation, near Paris. They are found also in the same formation in the Isle of Wight and elsewhere. The teeth differ from those of all other Pachydermata, extinct or recent. There are six incisors, two canines, eight præmolars, and six molars in each jaw—the dental formula thus agreeing with that of the fossil genus *Palæotherium* (q. v.); but the teeth are arranged in a continuous series without intervening vacancies—a circumstance very remarkable, as it does not occur in any existing quadruped, but now appears in man alone. The molars of the upper jaw are quadrangular, those of the lower marked with a double or triple crescent of enamel, which forms prominent ridges. In some respects, the teeth resemble those of the *Ruminantia* (q. v.), or ruminating quadrupeds, between which and the Pachydermata the A. has been thought to form a connecting link; but in some of the species originally included in this genus, and which are now sometimes ranked along with it under the name *Anoplotheroids*, the teeth exhibit peculiarities which have led to the supposition that their food may not have been exclusively vegetable. The snout is not much elongated, and it is evident that there was no proboscis. The feet are terminated by two toes, as in the Ruminantia; but they have always separate metacarpal and metatarsal bones, not a single *canon* bone. A considerable number of species of A. and of Anoplotheroids have been determined, differing in size from that of a small ass to that of a hare, or even of a guinea-pig; so that the smallest species must have been smaller than any hoofed quadruped now existing, or any known to have ever existed. They differ also considerably in general appearance, some having had comparatively long limbs and a light and graceful form, whilst some were firmly built and heavy. Their habits may be supposed to have differed accordingly. The true Anoplotheria were probably very similar in habits to tapirs. The powerful flattened tails of some are supposed to indicate an adaptation for aquatic life; others have smaller supplemental toes, besides the two hoofs. They form the genera *Dichodon*, *Dichobuné*, *Xiphodon*, and *Microtherium*.



Anoplotherium.

ANOPLU′RA, the name given by Leach to an order of insects called *Parasita* (q. v.) by Latreille, Cuvier, &c.—a part of the *Aptera* of Linnæus—of which the type is the genus *Pediculus* or Louse (q. v.).

ANOPSHEHR, a town on the Ganges, in the Meerut division of the N.W. Provinces, 65 miles from Delhi. Pop. (1872) 9366.

ANQUETIL-DUPERRON, ABRAHAM HYACINTHE, an oriental scholar, was born at Paris, December 7, 1731. He commenced the study of theology in his native city, and afterwards prosecuted it at Auxerre and Amersfort. But his love of oriental languages drew him back to Paris, where he was assisted by the Abbé Sallier, Overseer of the Manuscripts in the Royal Library. As he now possessed a tolerable knowledge of Hebrew, Arabic, and Persian, he enlisted as a private soldier for India in 1754, to gratify his passion for learning; but Malesherbes and the Abbé Barthélemy rescued him from this degradation, and enabled him, through the royal munificence, to proceed independently. After his arrival in India, he traversed a great part of the peninsula, but finally fixed his residence at Surat, where there was a colony of Parsees, or fire-worshipers, with whose priests he soon became so intimate, that they not only instructed him in the doctrines of Zoroaster, but also gave him some of their sage's books, written in Zend, in Pehlvi, and in Sanscrit. In 1762, he returned to Europe, having collected one hundred manuscripts, along with other curiosities. The Abbé Barthélemy now obtained for him a situation in the Bibliothèque Royale, and in 1763 he was elected a member of the Académie des Belles-Lettres. In 1771, he published his *Zend-avesta*, in 3 vols., which contained the results of his researches. It consists of a literal translation of the *Vendidad*, as well as other sacred books of the Parsees, preceded by a narrative of his travels. This work created a great sensation when it first appeared. Until then, our only knowledge of the doctrines of the ancient Persians had been obtained from Greek and Roman sources, hostile Mohammedans, and eastern nations of a later origin. But A. now presented to the investigation of Europeans the original records of these doctrines, or, at least, records of incontestable authority. Unfortunately, his zeal far surpassed his patience and sagacity. He had not a sufficient mastery over the languages from which he translated. His translations are, consequently, anything but accurate. Since A. wrote, great advances have been made in oriental scholarship, and his labors are now in a great measure superseded. Among his other works we may mention his *Legislation Orientale*, 1778; *Recherches Historiques et Géographiques sur l'Inde*, 1786; *La Dignité du Commerce et de l'état du Commercant*, 1789; *L'Inde en Rapport avec l'Europe*, 1790; *Oupnek'hat* (a selection from the theological portion of the Vedas), 1804. He died at Paris 17th January 1805.

ANSE, a name sometimes given to the handles of a cannon. These handles, especially in some foreign cannon, are cast in the forms of dolphins or serpents.

ANSELM of Canterbury, a scholastic philosopher, was born at Aosta, in Piedmont, in 1033. He led at first a dissipated life; and, like Abelard, wandered through France, after the fashion of the scholars of those days, disputing wherever he could find an adversary. Attracted by the reputation of Lanfranc, he went, in 1060, to study at the monastery of Bec, in Normandy. Three years after, he became prior, and in 1078, abbot of this monastery, the most famous school of the 11th c. Lanfranc, who in the meantime had gone to England, and become Archbishop of Canterbury, died in 1089; and the diocese remained four years without a successor, till, in 1093, A. was appointed. He was distinguished both as a churchman and a philosopher. His numerous embroilments with William Rufus and Henry I., and the unbending spirit which he displayed in these, even when subjected to banishment, indicate the vigor and resoluteness of his character, as much as his writings exhibit the depth and acuteness of his intellect. In 1720, Clement XI. expressly placed him in the list of church authorities. A. was a second Augustine, superior to all his contemporaries in sagacity and dialectical skill, and equal to the most eminent in virtue and piety. Embracing, without question, the doctrines of the church, mostly as stated by Augustine, and holding that belief must precede knowledge, and must be implicit and undoubting; he yet felt the necessity of a religious philosophy,

urged the duty of proceeding from belief to knowledge, and sought to reduce the truths of religion into the form of a connected series of reasonings. It was for this purpose he wrote his *Monologium sive Exemplum Meditandi de Ratione Fidei*. In his *Proslogium*, otherwise entitled *Fides quærens Intellectum* (Faith Seeking Intellect), he strove to demonstrate the existence of God from the conception of a perfect being. This ontological proof, however, has never been held satisfactory. His writings, *Cur Deus Homo*, and *De Concordiâ Præscientiæ et Prædestinationis*, made an epoch in Christian philosophy. A. may justly be reckoned the earliest of the schoolmen, although Alexander of Hales (q. v.) was the first who completely systematized in the scholastic manner the doctrines of the Catholic Church. He died 21st April, 1109, and was buried at Canterbury. The day of his death is observed in the Roman Catholic Church. See Rémusat's *Anselme* (1858) and Church's *A.* (1870).

ANSER. See ANAS and GOOSE.

A'NSGAR, or ANSCHA'RIUS, styled the Apostle of the North, on account of his labors to introduce Christianity into Denmark, Sweden, and Northern Germany, was born in Picardy about the year 801 A.D. Under the patronage of Louis le Débonnaire, he went, with his colleague Audibert, to preach the doctrines of Christianity among the heathen Northmen of Schleswig, where he suffered many persecutions; but had nevertheless such success that, in 832, the pope established an archbishopric in Hamburg, and A. was appointed the first archbishop. Here he passed through many difficulties, having to save his life by flight in 845, when the Northmen and Danes under Eric I. plundered Hamburg. He afterwards made several missionary tours in Denmark and Sweden, and died February 3, 864, at Bremen, where a church was named after him. The Roman Catholic Church has canonized him.

ANSON, GEORGE, LORD, ADMIRAL, born on 23d April 1697, at Shugborough, in Staffordshire. From an early period he manifested a predilection for a sea-life. In 1716 he served as second lieutenant under Norris; next under Byng in 1718, against the Spaniards; and was made a captain in 1723. In 1739, when war with Spain broke out, he was recalled from the Carolina station, on which he had been placed since 1724, and received the command of the fleet in the South Sea, with instructions to inflict whatever injury he could on the Spanish commerce and colonies, and sailed from England in September 1740. The preparations for this cruise had been made in the most slovenly manner. Both vessels and stores were bad, and the sailors were old Chelsea pensioners; yet A., in spite of these disadvantages, achieved a brilliant reputation by the heroism, prudence, diligence, and humanity he displayed. After his little fleet of seven vessels had been scattered by a storm, in doubling Cape Horn, he landed at Juan-Fernandez, where he was soon joined by three of his ships, which arrived in a dismantled condition. While he remained on this island, he exhibited his native tenderness of character by the assiduity with which he cared for the sick. Under these disadvantages he made several prizes, including a Spanish galleon from Acapulco, with a cargo worth £400,000. After this he returned to England; and arrived at Spithead, June 15, 1744, having circumnavigated the globe in three years and nine months. His perilous cruise greatly extended the knowledge of navigation and geography. As a reward for his services, A. was made Rear-admiral of the Blue (1744); and in 1747, having defeated the French admiral Jonquière, at Cape Finisterre, he was made Baron of Soberton; and four years later, First Lord of the Admiralty. In 1761 he was made Admiral of the Fleet. He died June 6, 1762. Few works have been so popular as Lord A.'s *Voyage Round the World*. It was written by Mr. B. Robins, from materials supplied by Lord A., who carefully supervised it.

A'NSPACH, or, more properly, ANSBACH, a town of Bavaria, the capital of the circle of Middle Franconia (*Mittel-Franken*), on the Rezat, 25 miles southwest from Nürnberg. It has manufactures of cotton and half-silken fabrics, tobacco, earthenware, playing-cards, cutlery, and white lead; also a considerable trade in wool, flax, and corn. The situation is pleasant, but there are no remarkable buildings, except the deserted palace of the former margraves of A., surrounded by gardens, and the church of St. Gumbert, said to occupy the site of a church erected in the 8th c., around which the town grew. The margraves of A. were a branch of the family of Hohenzollern. The last of them sold his possessions in 1791 to Prussia; and in 1806, Napoleon I. transferred A. to Bavaria. Pop. (1880) 14,195.

ANSTRUTHER (EASTER and WESTER), two contiguous royal burghs of Fifeshire, 9 miles S. of St. Andrews, with which along with Crail, Cupar, Kilrenny, and Pittenweem, they join in returning a member to parliament. Fishing, fish-curing, and tanning are the chief occupations. East A. is the birthplace of Dr. Chalmers, Tennant the poet, and Goodsir the anatomist. Pop. of both burghs (1881) 1842.

ANT (*Formi'ca*), a Linnæan genus of Hymenopterous insects, now divided into several genera, which form a family called *Formicidæ*. The English name is contracted from *Emmet*, still also occasionally used. Another old English name, not now in frequent use, is *Pismire*. The species are numerous, and are generally distributed over temperate and tropical regions. Their habits and instincts are extremely interesting, and have attracted attention from remote ages.

Ants are small insects, but of extraordinary muscular strength. They carry loads of ten or twelve times their own weight, and display great activity. They have a triangular head; the antennæ are geniculate; the jaws strong; the ligula or lower lip small, rounded, vaulted or spoon-like; the thorax compressed at the sides; the abdomen nearly oval, the pedicle which joins it to the thorax forming in some kinds a single, and in some, a double scale or knot.

They live in societies, often very large, which consist, as in bees, of *males*, *females*, and *neuters*. The neuters are females with imperfect ovaries, transformed at an early stage of their existence, and are distinguished into two classes, *workers* and *soldiers*, the former constituting the greater portion of each society, the latter somewhat differing from them in larger size, and larger and more powerful head. The ordinary work of the society is performed by the workers: the principal part in warfare, defensive or offensive, is taken by the soldiers. The males and females constitute but a small portion of each community. They have delicate glistening wings; but the neuters have no wings, and the thorax is smaller and more compressed. The males are smaller than the females, and the workers are rather smaller than the males. The females and neuters of some kinds (genera *Ponera*, *Myrmica Atta*, and *Cryptocerus*) are armed with stings; other kinds (*Formica* and *Polyergus*) have no sting, but have the power of ejecting a peculiar volatile acid, FORMIC ACID (q. v.), from a small sac in the abdomen; by this means effectually repelling many adversaries, to which the pungent fumes are intolerable. Small animals are soon killed by the vapor of an ant-hill; and a dog has been known to retire yelling from the effect upon his eyes, either of the vapor, or of a discharge of the fluid itself. It is said, that when those ants that are unprovided with a sting make use of their mandibles to inflict a bite, they curve round their abdomen, so as to be ready immediately to squirt this acid into the wound.

Atta barbara: A, one of the larger workers; B, one of the smaller workers; C, a male; D, a female—all natural size.

The winged ants mostly appear in autumn, and perish before the commencement of the cold weather; a few surviving to found new colonies and perpetuate the race. The neuters pass the winter in large numbers in a torpid state, and resume their activity on the return of spring. The nests of ants, after midsummer, are usually found to contain winged males and females mixed with the wingless neuters, which, however restrain them, and particularly the females, from making their escape into the air, until the pairing season, when they ascend into it in immense swarms, those from many ant-hills sometimes uniting their myriads, rising with incredible velocity in distinct columns, and soaring to a great height. 'Each column looks like a kind of slender network, and has a tremulous undulating motion. The noise emitted by myriads and myriads of these creatures does not exceed the hum of a single wasp. The slightest zephyr disperses them.' They occasionally, however, make their appearance in such prodigious numbers, that the air is obscured by them.—The pairing of ants is supposed to take place in the air. Some of the females which escape destruction by their enemies, or by the elements, found new colonies, in which at first they perform the work usually assigned to neuters. Some, however, are seized by the neuters of ant-hills near which they fall, and there is even reason to think that these go out to search for them; they are stripped of their wings, and forcibly conducted to the habitation, the number of whose inhabitants is to be increased by their multitudinous progeny. They are fed and treated with apparent respect, like the queen-bee among bees; but a society of ants, unlike one of bees, often contains numerous females, each thus treated and equally employed in the important work of laying eggs. Unlike the queen-bees, also, they are invariably denuded of all their wings; nor is this always done by the neuters, to prevent their escape, but the female ant, after fecundation, has been seen to denude herself of her own wings, as now superfluous appendages.

The eggs of ants are so small as to be scarcely visible to the naked eye. The mother drops them at random in her progress through the nest; but the workers, of whom some are always in attendance on her, immediately seize them, moisten them with their tongue, and lay them in heaps in particular apartments of the nest. They continue to watch them, and to remove them

from one quarter of the nest to another, apparently in order that they may always enjoy a suitable temperature, and perhaps in order to avoid any excess of moisture. In a few days the young larvæ are produced; and these require the unremitting care of the workers, which feed them, disgorging into their mouths, for this purpose, a viscid substance, supposed to be the ordinary food of the species, prepared for their use by a sort of half digestion. They are also extremely careful to keep the young brood clean, by constant application of their tongue and mandibles; and a great amount of labor is daily expended upon them, in conveying them from the inner apartments of the nest towards the surface after sunrise, when the weather is fine, and back again before sunset, or when the weather becomes cold, or there is a prospect of rain. The same care is extended to the pupæ. The larvæ and pupæ are the white objects which the workers are seen hastily seizing and carrying off to places of safety, when an ant's nest is broken open; and the resemblance of which, particularly of the pupæ, to grains of barley, is supposed to have contributed to the general belief, that ants amass stores of corn for winter food. The larvæ have no organs of locomotion. The pupæ are enveloped in delicate silken cocoons, and unlike those of other insects, require assistance to extricate themselves from them when they have attained their perfect state. This assistance also is afforded by the workers.

The whole supplies of food for the inmates of the nest are brought to it by the workers. The food of some kinds is exclusively or chiefly animal, that of others, vegetable. The provisions carried to their nests by the ants of Britain and other countries in which the winter is cold are apparently not intended for winter, when the creatures are entirely torpid, but only for present use; and few, if any of the species, feed on grain or seeds. But Colonel Sykes discovered at Poonah a species of ants (*Atta providens*), which not only store up provisions, but of which the stores consist of the seeds of a species of millet; and Mr. Moggridge has recently determined by careful observation that large stores of grain and seeds are laid up by some of the ants of the south of Europe, especially *Atta barbara* and *Atta structor*. The grain and other seeds stored up by ants seem, in some way not yet known, to be deprived of the power of germination. The ant has long been a sort of proverbal type, not only of industry, but of provident care for the future. Some ants, however, collect and carry to their nests substances which are not intended for food, but for the construction of the nest, and particularly for closing its apertures in cold or wet weather. In this way they gather together small heaps of chips of wood, bits of straw, small pebbles, &c.

The vegetable substance which ants seem chiefly to use as food is sugar; and to this, wherever it is to be found, they seem to be guided by a very acute sense of smell. *Honey-dew*, the saccharine excretion of the *Aphides* (see APHIS), is a favorite food of many species; and with this are connected some of their most extraordinary instincts; for not only do they climb the plants on which the aphides abound, that they may obtain this food, but they have been seen to wait beside them for new drops, and even to touch them with their antennæ, in order to cause the crops to flow, patting the abdomen of the aphis on each side alternately and rapidly; the ant, after the drop has been obtained, passing on to another aphis. The whole process has been likened to the milking of cattle. Even more wonderful things are asserted on this subject, as that particular ants seem to regard particular aphides as their own property, and are ready to fight in defence of their right to them—that, to secure them for themselves, they convey them from one place to another—and that the *Aphis radicum*, which derives its nutriment from the roots of grass and other plants, is actually kept in large numbers in the nest of the Yellow Ant (*Formica flava*), in order that there may be always at hand a copious supply of food, these aphides and their eggs sharing the solicitude of the ants equally with their own eggs and young. Things so wonderful are ascertained beyond dispute in regard to the instincts of ants, that even such statements as these must not be hastily rejected, as incredible, and certainly they express the beliefs of careful and scientific observers.

Ants which feed upon animal food render important service in clearing away every vestige of the flesh of dead animals, and so preventing corruption; and very beautiful skeletons of small animals have been obtained by burying the animal for a short time in an ant-hill. But ants also attack living animals: insects of comparatively large size fall a prey to them, and in tropical countries, birds, reptiles, and small quadrupeds are sometimes devoured by their vast swarms, which strip the bones of the animal perfectly clean with wonderful rapidity. Domestic animals, at least when sick, are not safe from them, and man himself regards them with dread. About a hundred years ago, vast numbers of a particular kind of Ant (*F. saccharivora*) appeared in the island of Grenada. This species makes its nest under the roots of plants, and the sugar-canes were so weakened and injured in consequence, that the plantations became nearly unproductive. 'They descended from the hills like torrents, and the plantations, as well as every path and road for miles, were filled with them. Rats, mice, and reptiles of every kind became an easy prey to them; and even the birds, which they attacked whenever they alighted on the ground in search of food, were so harassed, as to be at length unable to resist them. Streams of water opposed only a temporary obstacle to their progress; the foremost rushing blindly on certain death, and fresh armies instantly following, till a bank was formed of the carcasses of those which were drowned, sufficient to dam up the waters, and allow the main body to pass over in safety below. Even fire was tried without effect. When it was lighted to arrest their route, they rushed into the blaze in such myriads as to extinguish it.' A reward of £20,000 was offered in vain for an effectual means of destroying them; but in 1780 a hurricane which tore up the canes, and exposed their habitations to a deluge of rain, freed the island from this plague.

The habitations of ants are very curiously constructed, displaying great ingenuity, although with great diversity in the different species. The greater number of species form their habi-

Yellow Ants (*F. Flava*) and Nest.

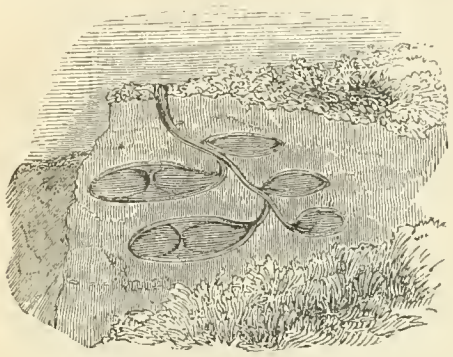
tations in the ground. These rise above the surface in the form of a dome; hence the name *ant-hills* commonly given them. The largest ant-hills formed by any British species are those of the large red or horse ants (*Formica rufa*), which are sometimes as big as a small haycock; but travelers in South America describe ant-hills of 15 or 20 feet in height. The nest of *F. rufa* is outwardly of rude appearance—a confused heap of such portable materials as were within reach; but within, it contains numerous small apartments, of different sizes, arranged in separate stories, some deep in the earth, some above its surface, and communicating with each other by means of galleries. Use is made of the earth excavated from below to mix with other materials in the construction of the upper parts of the fabric. Many species of ants, sometimes called Mason Ants, construct habitations by a still more elaborate masonry, making use, for this purpose, of soft clay, which they spread and mould by means of their mandibles and feet, appearing all the while to examine their work by their antennæ. The partition-walls of the galleries and apartments of the *Formica brunnea* are about half a line thick, and about half an inch high; the roofs are somewhat arched, and pillars are frequent in this marvelous architecture. M. Huber saw a working-ant of another species (*F. fusca*), without assistance, make and cover in a gallery which was two or three inches long, and of which the interior was rendered perfectly concave. There are other species, sometimes called Carpenter Ants, which make their habitations in the trunks of old trees, gnawing the wood into apartments and galleries, with floors and partitions as thin as card. *Formica flava* forms its partition-walls of a sort of *papier-mâché* of saw-dust, earth, and spider's web. *F. smaragdina*, an East Indian species, forms its nest of a thin silk-like tissue. *F. bispinosa*, in Cayenne, makes a felt of the down which envelops the seeds of the *Bombax Ceiba*. An East Indian species, *Myrmica Kirbii*, forms a globular nest of a congeries of tile-like *laminæ* of cow-dung, the interior exhibiting an assemblage of apartments and galleries.

Nest of Carpenter Ants.

Some Australian ants form their nests of the leaves of trees glued together, after being first brought into the proper position by the united strength of multitudes.

Of the ants which form their nests in the ground, some, instead of constructing ant-hills, seek the protection of stones, roots of trees, &c. This is the case with some of the British species, and also with the sugar ant of the West Indies, already mentioned.

Many interesting anecdotes are on record illustrative of the instincts of ants, and of the sagacity which they seem to possess. They appear also to have some power of communicating with each other, in which it has been supposed that the antennæ are chiefly employed. Some such power might be supposed to be necessary, if we could venture to reason from analogy upon such a subject, not only to their architectural and other ordinary operations, in which many must take part, systematically and conjointly, but also in their predatory and warlike excursions; for these also some of the species have. If, during the predatory excursions of the *Atta cephalotes* (a South American species), an intervening space occurs which they cannot cross, some of the creatures link themselves together—as monkeys, in like circumstances, have been known to do—forming a bridge over which the main body passes. Ants are, in general, both courageous and pugnacious. Many battles take place among them, both between individuals and large parties; and after a battle, combatants may be found locked in each other's arms, as having died together in the struggle. More extraordinary than anything of this kind, however, is the fact, sufficiently ascertained, that some species of ants go on regular forays to carry off the larvæ and pupæ of certain other species, which they carry to their own habitations to rear and employ them as slaves in the work which might be regarded as properly belonging to workers of their own race—a fact to which no other at all analogous has yet presented itself in natural history. The species known thus to make and keep slaves are *Polyergus rufescens* and *Formica sanguinea*, both sometimes called Amazon Ants. It has been noted as a curious circumstance that the kidnappers are red or pale colored ants, and the slaves jet black. The kidnapping excursions take place only at a particular period of the year, when the nests of the black ants contain the neuter brood. The army of red ants (*P. rufescens*) marches forth, the vanguard, which consists of eight or ten only, continually changing; and on their arriving at the nest of the negro ants, a desperate conflict ensues, which ends in the defeat of the negroes; and thereupon the red ants, with their powerful mandibles, tear open the now undefended ant-hill, enter it, and emerge, carrying the pupæ in their mouths, with which they return in perfect order to their own nest. The pupæ are there treated with great care, and spend their lives among the red ants, excavating passages, collecting food, carrying larvæ, &c., as if this had been their original destination. The amazon ants are not natives of Britain, although plentiful in some parts of Europe.



Section of Bank, showing Nests of the Mason Ant.

Formic acid has been employed as a stimulant in gout and paralysis, and is sometimes exhibited in continental practice by means of *ant-baths*, which are prepared by boiling crushed ants, or whole ant-hills, and immersing the diseased limb in the steam.

TERMITS (q. v.), WHITE ANTS, are very different from the true ants, and belong to the order *Neuroptera*. See Lubbock's *Ants, Bees, and Wasps* (1882).

ANTA'CIDS are medicines which correct abnormal acidity of the stomach and intestinal canal by directly combining with the free acid that may be present. Their action is obviously merely temporary, as, unless combined with other medicines, they do not correct the morbid condition which causes the undue acidity; and their too prolonged use must be carefully avoided, since at all events, some of these medicines, as the alkalies and their carbonates, are liable to induce a state of general anæmia, morbid deposits in the urine, and a series of symptoms not unlike those of scurvy. Antacids are best given in association with vegetable tonics; and for the reasons already stated, their administration must be carefully watched, and should be occasionally omitted. Dr. Neligan makes the following excellent remarks on the particular remedy to be employed for special forms of acidity: 'When the acid exists in the stomach in the gaseous state, ammonia or its carbonates should be preferred, as, in consequence of their volatility, a gaseous acid which would elude the action of the fixed alkalies, may be neutralized by them. If the acidity be present in the lower bowel, as in the cæcum or colon, magnesia or lime ought to be administered, as being less likely than the other antacids to be neutralized or absorbed before it reaches that portion of the intestinal canal. When the acid exists in the urinary organ, the alkalies will be found best adapted, as they have a tendency to act more directly on the kidneys; and when it is *lithic* (or *uric*) *acid* which preponderates in the urine, the preparations of lithia or potash should be preferred to those of soda, as the salts formed by the two former with the acid in question are much more soluble than those formed with the latter. In persons of a corpulent habit of body, potash is to be preferred to ammonia or soda when the use of an alkali is indicated. And finally, ammonia and its preparations are best adapted for the old and debilitated, as also for those of enfeebled constitution.' The antacids include solutions of ammonia, lime (commonly known as lime-water), potash, and soda, various carbonates of these substances, magnesia and its carbonates, and the carbonate and citrate of lithia.

Many of the medicines of this class possess other properties besides that of neutralizing free acids; but a notice of such properties does not fall within the scope of the present article.

ANTÆ. See PILASTER.

ANTA'LCIDAS, a Spartan politician, who made himself conspicuous in a very perilous crisis of the history of his nation by the skilful character of his policy. Some time after the Peloponnesian War, it seemed as if Athens were destined to regain the supremacy she had lost. The Greek states rallied round her; while Conon, an able and vigilant Athenian admiral, and his ally, Pharnabazus, the Persian, were everywhere victorious in their naval encounters with the Spartan fleet. It became necessary, therefore, that communications should be entered into with the Persian king, from whom the confederate Greeks drew their chief resources. A. was chosen ambassador to Tiribazus, satrap of Western Asia. On hearing this, the Athenians grew alarmed, and sent Conon to frustrate the schemes of the former; but Tiribazus took A.'s part, and the result was, that Conon was thrown into prison, and A. secretly received money to enable Sparta to continue the war. At first, Artaxerxes, the Persian monarch was dissatisfied with the conduct of his satrap, recalled him, and put Struthas, a friend of Athens, in his place; but through a complication of circumstances, which it is unnecessary to mention, A. was subsequently completely successful in securing the goodwill of Artaxerxes. He was now appointed admiral of the Spartan fleet, and assisted by Tiribazus, Ariobarzanes, &c., swept the seas until Athens became desirous of peace. For various reasons, so was Argos and Sparta herself. Tiribazus therefore assembled deputies from the Greek states, and, in the name of his master Artaxerxes, read the famous declaration or treaty of peace, to which all the members present agreed, and which is known in history under the name of 'the Peace of Antalcidas,' as being the result of the latter's able diplomacy. Its three great points were as follows: 1. That all the Greek towns on the mainland of Asia Minor, together with the islands Clazomene and Cyprus, should remain under the protection of the Persian king. 2. That all other Greek towns, large and small, should be independent; but that the islands of Lemnos, Imbros, and Scyros should belong to Athens. 3. That war should be declared against whatever state refused to accept these points. After this peace, the history of A. becomes doubtful and obscure. He seems to have lost favor with the Persians, and Plutarch even leads us to suppose that, sickened by misfortune and the loss of reputation, he voluntarily starved himself to death; but this story is not credited by scholars both on account of its intrinsic improbability and its apparent disagreement with the statements of other writers.

ANTANANARIVO, or TANANARIVO, the capital city of Madagascar, and seat of the government, has a population estimated at 80,000. It is situated on a hill, in an undulating district, at an elevation of 5000 feet above the level of the sea. It is exposed to fearful thunder-storms. The approach to it from Tamatave, the chief seaport, is extremely tedious and difficult, owing to the want of roads. It is, in spite of this, the seat of considerable trade and industry. The royal palace occupies the summit of the hill; adjoining are the dwellings of the chief officers of the government; and below these, covering the slope of the hill, and built on terraces, are the houses of the other inhabitants, constructed of mud and sun-dried bricks. The people exhibit a considerable aptitude for civilized usages; and, thanks to missionary enterprise, considerable progress has been made towards the adoption of European habits.—See the works on Madagascar by Mullens (1875) and Grandidier (1876); also *Three Visits to Madagascar* (1858) and *Madagascar Revisited* (1867) by Ellis. In the latter work will be found a plan of the city, showing the missionary churches, chapels, dispensary, hospital, &c., and views of the principal houses.

A'NTAR, or ANTA'RA, a celebrated Arab chief of the sixth century, one of the seven poets of Arabia, whose prize-poems, embroidered in golden characters on a silken ground, were hung

up on the gate of the Caaba, and thence called *Moallakat*—i. e., the Suspended. In the poem of his that has descended to our day, he paints his warlike deeds, and his love for Abla. His courage and heroism during a forty years' warfare between two Arab tribes, and his constancy in love, were long dear to the memory of his countrymen, and appear to have formed the groundwork of the voluminous romance called *Antar*, commonly ascribed to Asmai, and reduced to writing as early as the days of the Calif Haroun Alrashid in the 8th c. This work, which has come down to us in a later and much corrupted form, gives an attractive and faithful picture of Bedouin life, and is rich in epic interest, although too monotonous to satisfy the taste of the European reader. In the East, however, it still supplies the favorite themes of the professional story-tellers who haunt the coffee-houses. A poetical translation of it into English was made by Terric Hamilton in 1820.

ANTARCTIC OCEAN, the sea round the south pole, as the *Arctic Ocean* is the sea round the north pole. It is otherwise called the Southern Ocean, comprising all the sea to the south of the Atlantic, the Indian, and the Pacific Oceans. In this view the A. Ocean's northern limit may be conveniently divided into three straight lines—the *first* between Cape Horn in South America and Cape Agulhas in Africa; the *second*, between Cape Agulhas and the southern extremity of the Auckland Islands as an appendage of New Zealand; and the *third*, between the southern extremity of the Auckland Islands and Cape Horn. This appears to form the true boundary of the polar regions of the southern hemisphere. The most northerly isles which it encloses are New Georgia, at the mouth of the Atlantic, and Kerguelen's Land, at the mouth of the Indian Ocean. The latter tells its own story in its other title of 'The Island of Desolation;' and the former presented to Cook, even in the middle of summer, perpendicular cliffs of ice, and valleys covered with everlasting snow.

It is usual, indeed, to define the Antarctic Ocean and the corresponding ocean to the north, as being contained each within its own polar circle. But, with regard to both oceans alike, this definition appears to be inadmissible. It is only at two points — the head of the Pacific and the head of the Atlantic—that the Arctic Sea can possibly reach the Arctic Circle at all; while, in point of fact, it overlaps it at Behring's Strait by nearly a degree, and falls several degrees short of it between the northern half of Norway and the south-east shore of Greenland. The A. O., again, is nowhere practically limited by the definition in question: not a single voyager hesitates to use the expression long before he arrives at lat. 66° 30′ S.; nor yet is a single authority consistent in the use of the arbitrary nomenclature.

The A. O. has been explored, more or less satisfactorily, by various navigators, as far as 79° S. With a few exceptions, however, little of it is accurately known, the difficulties and dangers of its navigation rendering thorough and continuous investigation almost impracticable. The names that will recur in their proper places are New Georgia, Kerguelen's Land, Sandwich Land, New South Shetlands, New Orkneys, Enderby's Land, Graham's Land, Balleny, Sabrina, and Victoria Land.

Taken as a whole, these lands bear a very small proportion to the extent of an ocean which embraces half the latitudes and all the longitudes of the southern hemisphere, exceeding its kindred sea to the north, as a glance at the map will show by nearly half of Asia and North America, and the whole of Europe. Such of these lands as are realy accessible at all times, have been more or less valuable in connection with the whale and seal fisheries.

The features of the A. O. itself may be briefly stated to be constant fogs, battling currents, innumerable icebergs, and magnificent manifestations of the Aurora Australis. On the coast of Victoria Land, beyond the parallel of 70°, two mountains have been observed to be of a height altogether unequalled in such a latitude—Mt. Terror, of 10,000 feet, and Mt. Erebus, of 12,400. The latter is a volcano, being, it is apprehended, the only phenomenon of the kind in either of the frigid zones.

Of the two circumpolar oceans, the southerly one has excited much less interest than the northerly. The open passages round the two capes respectively into the Indian Ocean and the Pacific, have, from the very beginning, rendered unnecessary any such voyages as those which, for nearly three centuries, have developed so much patience and fortitude in the heroic explorers of the Arctic shores.

ANT-BEAR. See ANT-EATER.

ANT-CATCHER and ANT-THRUSH, names given to birds of tropical and sub-tropical countries, which feed chiefly upon ants. They are closely allied to the Thrushes (see THRUSH), and are included with them in the family *Turdidæ* or *Merulidæ* of recent ornithologists.—They are distinguished by a straight sub-cylindrical strong bill, hooked at the tip, slender legs, and very short tails. They form the genus *Myothe'ra* of Illiger, now subdivided into several genera, one of which, *Pitta*, contains the *Brèves* of Buffon —birds of brilliant plumage, natives of the south-eastern parts of Asia and the Malayan Archipelago. The true ant-catchers are mostly American, are of comparatively sober plumage, live among the huge ant-hills, seldom fly, and are remarkable for their sonorous voices, the power of which in some species is extraordinary. The largest species, known as the *King of the Ant-catchers* (*Grallaria Rex*), is about the size of a quail. Its legs are remarkably long.

ANT-EATER (*Myrmeco'phaga*), a genus of South American quadrupeds belonging to the natural order *Edentata*. The species are few. They are perfectly toothless, their food being insects, and particularly ants, which they procure in great numbers by thrusting among them a very long cylindrical tongue, covered with a viscid saliva, and then retracting it into the mouth. The head is

Great Ant-eater (*M. jubata*).

remarkably elongated, with a slender muzzle, and a small mouth. The tongue is doubled up in the mouth when not in use for catching prey. The ears and eyes are very small. The toes differ in number in the different species, but are united as far as the base of the claws, which are very large and strong, adapted to tearing up the habitations of ants. The Great A.-E. (*M. jubata*), a native of the warm parts of South America, and called in Demerara the A.-bear, is about 4½ feet in length from the snout to the origin of the tail, which is more than 2 feet long, and is covered with very long hair. The body is also covered with long hair, particularly along the neck and back. There are four claws on each of the forefeet, and five on the hind ones. The A.-E. spends much of its time in sleep, the long snout concealed in the fur of the breast, the hind and fore claws locked together, and the bushy tail thrown over all, as if for a shade from the sun.

It is very unsocial in its habits, and is regarded as a very stupid animal. It has great strength in its fore-legs and claws, and it is said to hug like the bear, so as to crush an enemy to death. The female produces one young one at a birth, and carries it about for some time on her back.—Another species, the Tamandua (*M. Tamandua*), having the same number of claws, has a less elongated snout, comparatively short hair, and a prehensile tail, is scarcely so large as a cat, and climbs trees in quest of its insect food.—The Little or Two-toed A.-E. (*M. didactyla*) differs from these species not only in the number of its toes, but in other anatomical characters.—Closely allied to this genus in structure and habits is the genus *Manis*, containing the PANGOLINS of Africa and India; but instead of hair, the body is covered with strong horny scales. See PANGOLIN.—The name A.-E. is given at the Cape of Good Hope to the *Orycteropus Capensis*, the Aard-vark or Earth-hog of the Dutch colonists, a quadruped of about the same size with the great A.-E. of America, belonging to the same natural order, and resembling it also in its elongated muzzle and extensile tongue, which it employs in the same way, but provided with grinding teeth and flat claws adapted for burrowing. It burrows with extraordinary facility, and it is in this way that it seeks to secure its safety when assailed. It has very short hair and little of it. The ears are moderately long. It is a nocturnal animal, and very timid.—The *Echidnæ* of New Holland are sometimes called Porcupine Ant-eaters, from their food and their similarity to the true ant-eaters in their sharp muzzle and extensile tongue; but they differ much in some parts of their structure. See ECHIDNA.

ANTECE'DENT, a term in Logic, Grammar, and Mathematics. Thus we call a proposition in Logic from which another is deduced, or a general principle which serves as the base and support of some particular proposition, the A. In Grammar, the A. is the word which precedes the relative—as, for example, 'The *man* who dies for his country should be held in honor.' Here 'man' is the A. In Mathematics, we speak of the A. of a ratio,—i. e., the first of two terms which compose the ratio. Thus, in the ratio of 4 to 3, 4 is the A. The word is also used in the plural in a peculiar sense. 'We know very little of his *antecedents*' i. e., of his previous character or conduct.

ANTEDILU'VIAN is the word used to denote whatever existed before the Flood. The A. ages are those which elapsed before the Flood, and, in theological language, the A. religion means the religion of the patriarchs from Adam to Noah. In Geology, the 'A. period' has no reference to the deluge recorded in the Mosaic

narrative, but only to the final transformation of the earth by means of water.

A'NTELOPE (*Antilope*), a genus of Mammalia belonging to the order of Ruminants (q. v.), and to the hollow-horned section of that order—in which the horns consist of an elastic sheath surrounding a bony process of the skull, and are permanent, not annually renewed. The antelopes have the bony nucleus of the horns solid, not occupied, as in those of goats, sheep and oxen, to a considerable extent, with cells communicating with the frontal sinuses.

They are also distinguished from the allied genus of goats by having the chin beardless, and from them and sheep by the horns not being longitudinally angled or ridged. The horns of antelopes are, however, very generally annulated, or surrounded with thickened rings. The body is slender and deer-like, the feet small and elegant, the tail short and tufted, the hair generally short, and the color often lively. Some species, however, have comparatively long hair; and a few which inhabit cold mountainous regions are clothed with wool intermixed with longer and coarser hair, particularly the CHAMOIS (q. v.) of the Alps, Caucasus, &c.; the ROCKY MOUNTAIN GOAT (q. v.) of North America; and the CHIRU (q. v.) of the Himalayas. Many species have infra-orbital sinuses or *tear-pits* like DEER (q. v.). The females of many species, as of deer, are destitute of horns; and if they alone came under observation, it would be difficult to say to which genus they belonged. The size is very various; the Guevei or Pigmy A. of Africa (*A. pygmæa*) is only 8 to 9 inches high at the shoulders, whilst the largest species measure 5 or 6 feet. Almost all the species of antelopes are peaceable, timid animals, and are distinguished by their agility and fleetness. Most of them are gregarious. Some inhabit plains; others are found only in the most inaccessible mountainous regions; whilst others dwell in jungles and deep forests. North America possesses two or three species, which depart considerably, as does the chamois of Europe, from the typical character of the genus. Europe produces only the Chamois and the Saiga (*A. Saïga*), the *Colus* of Strabo, which inhabits the southern plains of Poland and Russia. Asia has a greater number of species; but they are most numerous in Africa, and particularly in South Africa. The known species amount to more than eighty, which are arranged in sections or groups according to the peculiarities of the horns and other characters, but a satisfactory classification of them is difficult. Some naturalists make a family of *Antilopeæ*, and subdivide it into genera, but they are not separated by sufficiently marked characters. The flesh of all antelopes is used as food; hence they are much objects of the chase. They furnish also great part of the subsistence of beasts of prey in Africa, where some of the species exist in such numbers that, particularly when severe drought occurs in the regions which they ordinarily inhabit, dense and multitudinous herds occasionally appear in the interior of Cape Colony, to the terrible devastation of the crops. Even the saigas of the Tatarian plains congregate in herds of many thousands in the end of autumn.

The name A. is sometimes more particularly restricted to a species also known as the Common or Indian A., and as the Sasin. It is a native of India and the eastern parts of Asia, and is a beautiful animal, about 2½ feet high at the shoulder, with erect diverging horns, bent in a spiral of two or three turns. The hair is uniformly short, except that, as in many other species of A., there are small tufts of bristles on the knees. It inhabits open plains, and the herds exercise great watchfulness. Its fleetness is such that greyhounds chase it in vain; and it can easily bound over an enclosure of 11 feet in height, or over a distance of 10 or 12 yards. The flesh is held in small esteem, and the animal is less than many of its congeners an object of the chase.—The Saiga is a much less graceful animal; its horns are short, and, as in many of this genus, curved first outwards and then inwards, so that the whole outline formed by them resembles that of a lyre. They are used by the Russians and Chinese for the manufacture of many articles of domestic economy; and it is chiefly for their sake and that of the skin that the saiga is hunted, the flesh having a disagreeable taste, which is ascribed to the saline and aromatic plants of the steppes.—The Dzeren (*A. gutturosa*), sometimes called the Chinese A., and known among the Chinese by a name which signifies the Yellow Goat, is an inhabitant of the arid deserts of Central Asia, the flesh of which is highly esteemed, and which is therefore a chief object of the chase in these regions. It derives its specific name from a large movable goitre-like protuberance on the throat of the old males, produced by dilatation of the larynx.—The Addax, or Nubian A. (*A. Addax*), which was known to the ancients, and is mentioned by Pliny, has horns very similar to those of the Indian A., but is a larger animal, less graceful, with a slight mane on the neck, a tuft of long hair on the forehead, and large broad hoofs, adapted for treading on fine and loose sands. It inhabits the deserts of Central Africa, and, contrary to the usual habits of the genus, is said not to be gregarious, but to live in pairs. The Chikara and some other Indian species are distinguished by two additional rudimentary horns in front of the ordinary horns, and immediately over the orbits. The chikara inhabits thick forests and jungles. Like the addax, it lives in pairs; as do also the Stein-boc (q. v.) of South Africa, an extremely graceful species; and the Kleene-boc of the same country (*A. pygmæa*), a beautiful and active little creature, with very small horns. The kleene-boc is of a mild and gentle disposition, and extremely capable of domestication.

Head of Antilope Chikara.

The Gazelle (q. v.) of North Africa (*A. Dorcas*), one of the species known to the ancients, is very frequently domesticated; and from its gracefulness of form, its gentleness of manners, and its bright black eyes, has afforded to the Arabian poets one of their most favorite objects of comparison. The South African SPRINGBOC (q. v.) is another very beautiful species, and is frequently domesticated by the colonists at the Cape of Good Hope. Among the numerous species which that country produces may be mentioned also the Blauw-boc (*A. leucophæus*); the Riet-boc (*A. arundinaceus*); and the Caffrarian ORYX (q. v.), (*A. Oryx*), which somewhat resembles, but is quite distinct from, the Oryx of the ancients (*A. Leucoryx* or *A. Gazella*), also called the Algazel, a native of the countries on both sides of the Red Sea. Still more worthy of notice among the South African species, but in some measure departing from the strict A. type, is the ELAND (q. v.), the largest of all the antelopes—an animal which may yet probably be found very valuable in domestication. The KUDU (q. v.) is another noble species, allied to the eland. The NYL-GHAU (q. v.) of India, and the GNU (q. v.) of South Africa, are also among the largest antelopes, but depart still further from the generic type, particularly the latter, so that a separate genus (*Catoblepas*) has been constituted for it, having better claims to be recognized than the other genera into which it has been proposed that the antelopes should be divided. Less different from the ordinary type, but still with a marked approach to a bovine appearance, are the BUBALUS (q. v.) of the ancients, a native of the north of Africa, the Arabic name of which signifies wild ox, and the KAAMA (q. v.) or Harte-beest of the Cape of Good Hope, which is nearly allied to it. The PRONG-HORN (q. v.) and the ROCKY MOUNTAIN GOAT (q. v.) are the best known North American species; and both are found only in the western parts of the continent. It has been proposed to introduce the latter, as a wool-bearing animal, into the Highlands of Scotland.

Addax (*A. Addax*).

ANTE'NNÆ, in Zoology, jointed filaments with which the heads of Insects, Crustacea, and Myriapoda are furnished and which are evidently very delicate organs of touch. They are therefore sometimes called feelers. The name A. is derived from *ante*, before. The A. are placed on the anterior or superior part of the head; the animals appear to feel their way with them, and to them is ascribed the bee's power of working in the dark. Some suppose that they are also organs of hearing, and by means of them it would appear that many insects, as bees and ants, have the power of communicating with one another. They possess great flexibility, but differ very much in the number of joints which they contain (amounting sometimes even to 100), in the relative length and thickness of their joints, and also in their form, being filiform or thread-like, clavate or club-shaped, feathered, &c., in endless variety.

ANTEQUE'RA (the *Anticaria* of the Romans), an important town in the province of Malaga, Spain, is situated in a fertile plain, 45 miles west of Granada. Pop. 25,550. The inhabitants are engaged chiefly in agricultural operations, but also manufacture baize, silk, cotton, and paper. They are noted for their love of bright colors in dress. Although A. is clean and well built, it is rarely visited by travelers, on account of its lying considerably off the high road. As late as 1544, the place possessed, in almost perfect condition, an ancient palace and theater; but about that time the stones were plundered to build a convent, and only a few were spared, which are now imbedded in the walls of the town. A., like all the other cities of South Spain, was for a while in the hands of the Moors; but in 1410 it was retaken by the Regent Fernando, who is hence called *El Infante de A.* When the French took the place, during the Peninsular War, they converted a curious old mosque—a relic of Moorish sway—into a storehouse, and on their departure carried off with them the magnificent Moorish armory.

ANTHE'LIA (Gr. *anti*, opposite, and *helios*, the sun; Ger. *Gegensonnen*) are luminous rings, seen by an observer on a cloud or fog which lies opposite to the sun. They occur chiefly in alpine regions and in the polar seas, and are only seen when sunshine and cloud, or fog, occur at the same time. They appear in the following way: When, from an elevated position—as the mast of a ship, or the ridge of a hill—the shadow of an observer is projected by the sun on a cloud or fog, he sees the head encircled by a glory or luminous ring, diminishing in brightness as it leaves the head as a center. When the sun shines brightly, and the fog is dense, as many as four concentric rings of this nature are seen by the observer round the shadow of his head, having their common center in the point where a line from the sun through the eye of the observer meets the fog. When the phenomenon assumes this form, the rings are more or less colored—the colors of the two inner rings being generally brilliant, those of the third more faint, while those of the fourth are scarcely perceptible. This last has an angular radius of about 40°, and is very seldom seen. It bears frequently the name of the Circle of Ulloa or the White Rainbow. A phenomenon substantially similar to the A. occurs when, the sun being near the horizon, the observer sees an aureola surrounding the shadow of his head cast upon grass or corn moistened with dew. The occurrence of A. is generally attributed to the diffraction (q. v.) of light.

ANTHEM (Gr. *anti*, in return, *phone*, voice; a piece sung in alternate parts), a species of musical composition introduced into the service of the English Church after the Reformation, and appointed to be sung daily, at morning and evening service, after the third collect. The words of the A. are taken from the Psalms, or other suitable parts of the Scriptures, and the music is either for solo, soli, or chorus, or a mixture of all three. As a specimen of English music, it can only be heard to perfection in cathedral service. In its origin, musical construction, and use, it is similar to the motet of the Romish Church, which name has been retained by the Lutheran Church. See MOTETT; also ANTIPHONY.

ANTHEMIS. See CHAMOMILE.

ANTHER. See STAMEN.

ANTHERI'DIUM, the name given by some botonists to an organ in cryptogamous plants which they suppose to be analogous in its functions to the stamen or male organ of fructification in phanerogamous plants. Antheridia are variously situated on the surface of plants or within their tissue. Sometimes they are simple cells; sometimes they are composed of a number of cells, containing a mucilaginous fluid, and peculiar small bodies called *Phytozoa* (q. v.), which at a certain period exhibit active movements like those of animalcules. The antheridia finally discharge their contents through an opening; and it is supposed by some that their contact with another class of organs, to which the name PISTILLIDIUM (q. v.) has been given, is essential to the production of spores, the seeds of cryptogamous plants. But these names are to be regarded as at best only provisional, and these views as far from being sufficiently established.

ANTHO'LOGY (Gr. flower-collection) is the title usually given to a book consisting of an unconnected series of choice thoughts, whether in prose or verse, but generally in the latter. Of the collections of this kind made in ancient times, which consisted mostly of epigrammatic poems, the best known are the

Greek Anthologies.—The first Greek A. was compiled by Meleager of Gadara, in Syria, about 60 B.C. Besides this, there were three or four others belonging to periods considerably subsequent to the birth of Christ; but all these earlier anthologies are lost. What we now possess are two later collections, one by Constantine Cephalas in the 10th c., who borrowed largely from one of the earlier anthologies; and another by Maximus Planudes, a monk of Constantinople in the 14th c., who, by his tasteless selection from the A. of Cephalas, rather spoiled than increased the already existing store. The A. of Planudes was first issued in print at Florence in 1494 by a learned Greek, John Lascaris, and for a long time was the only one known. It went through successive editions, and received various improvements. The latest edition (with the Latin version of Grotius, a master-piece of latinity and rapid execution) was commenced by Boseh in 1795, and finished by Lennep in 1822. Meanwhile, Claude Salmasius had discovered in the Heidelberg Library (1606) the only extant manuscript of the older and richer A. of Constantine Cephalas, which he compared with that of Planudes, copying out the poems not found in the latter. During the Thirty Years' War, the Heidelberg manuscript was carried to Rome; but in 1797, after the peace of Tolentino, the French contrived to secure possession of it, and brought it to Paris. In 1816 it was returned to Heidelberg. After the important discovery of Salmasius, the work was often mentioned by the name of the Palatinate Manuscript, or the Vaticano-Palatinate. Portions of it were published by Jensius, Leich, Reiske, and Klotz. The entire collection, augmented by fragments of the older poets, and by epigrams found on monuments and in other works, was edited by Brunck at Strasburg in 1776, under the title *Analecta Veterum Poëtarum Græcorum* (Selections from the Old Greek Poets), and later by Jacob, under the title of *Anthologia Græca, sive Poëtarum Græcorum Lusus ex Recensione Brunckii* (Greek A., or Fugitive Pieces of the Greek Poets, from the corrected Text of Brunck), 1794—1814, at Leipsic. Since then, it has been published variously, in whole or part. It is impossible not to admire these gems. Nowhere is there to be found a richer variety of poetic life, greater delicacy of sentiment, a more joyous serenity, a greater abundance of wise, true, human thoughts, than sparkle in the pages of the Greek A. To the poet, it presents the most graceful images and the most exquisite conceptions; to the philosopher, maxims adorned with all the graces of style; to the historian, monumental inscriptions; to the philologist, the most varied forms of an imperishable language; to all, a charming revelation of antiquity.

Latin Anthologies.—In 1573, Scaliger published at Leyden, in imitation of the Greek A., a Latin A., under the title *Catalecta Veterum Poëtarum* (Gatherings from the Old Poets), and Pitthöus one at Paris, 1590. A larger collection was issued at Amsterdam (1759 and 1773) by Peter Burmann the Younger, under the title *Anthologia Veterum Latinorum Epigrammatum et Poëmatum* (A. of Old Latin Epigrams and Poems), a more correct and better arranged edition of which was published by Meyer in 1835.

Asiatic literature is extremely rich in anthologies, which consist sometimes of extracts from the best poets, arranged according to the subject, and sometimes of 'beauties' of their best poets, with biographical notices, which are either placed in chronological order, or according to the countries in which the authors lived.

1. *Arabic Anthologies.*—Abu-Temam published selections from the old Arabic songs previous to the time of Mohammed, arranged them in ten books, and named the entire collection after the first book, which consisted of war-songs, *Hamâsa*. Another famous A. is the *Divan* of the Hudhailites (an Arabic tribe), an edition of which was published by Kosegarten. Abu'l-Faraj of Ispahan (died 966) gathered together in his *Kitâb al-aghâni* (Book of Songs), all the ancient Arabic songs down to the first centuries of the Califate. It was published by Kosegarten in 1840. Abu'l-Faraj accompanied the work with a minute commentary, which makes it one of the most interesting of the old Arabic literature. But the richest and most complete A. of the later Arabic poesy is *Yatimat al-dahr* (the Pearl of the World), by Taalebi, in which the writers are arranged according to the provinces in which they lived. It has been continued and enlarged since the period of the original compiler. Besides these and similar national anthologies, collections have been made in almost every province where the Arabic culture and speech prevailed. Such, for example, are the numerous Arabico-Spanish ones, though these are but little known.

2. *Persian Anthologies.*—In the Persian literature, the best known works of this sort are *Taskarat al Shuara* (Lives of the Poets), by Daulet Shah (died 1495), the contents of which are to be found almost entire in Hammer's work on Persian *belles-lettres* (Vienna, 1818), and *Atesh Kedah* (the Fire Temple), by Haje-Lutf-Ali Beg, who lived about 1770. Both works give biographical notices of the Persian poets: the first, in chronological order; the second, in topographical order, with specimens from their works. An A. of the best Persian poetry, arranged according to the subjects, is given in the *Medshua al Shuara* (a Collection of Poets).

3. *Tatar Anthologies.*—Of the poets who have written in the Tatar —i. e., the East Turkish or Tshagatai dialect—we possess a collection comprising 441 biographies, with specimens of their poetry: *Madshalis alnasais* (Charming Company), by Mir-Alischir (died 1500), and the *Lives of the Tatar Poets*, by Sadiki, extending down to the 17th c.

4. *Turkish Anthologies.*—The number of anthologies in the West Turkish, or, as it is generally called, the Turkish language, is very numerous. The most famous are—*Hesht Behesht* (the Eight Paradises), by Sehi of Adrianople (died 1548); *Taskarat al Shuara* (Lives of the Poets), by Latifi (died 1582), and, under the same title, a similar work of Ashik Tshelebi (died 1571); and the great collection, *Subdat al-ashaar* (the Blossoms of Poetry), by Kassade (died 1621). The substance of these anthologies is to be found in Hammer's *History of West Turkish Poetry* (Pesth, 1836).

5. *Indian Anthologies.*—The literature of the Mohammedan population of Hindustan, which is a mere copy of Persian literature, has also several anthologies. The most important are—*Galzari Ibrahim*, by Ali Ibrahim, containing biographical notices of 300 Hindustani poets, with specimens of their writings; the collection called *Diwani Iihan*, by Beni-Narâyan; *Guldastai Nishât* (Garland of Pleasure), by Mann Lal (Calcutta, 1836); and *Guldastai Nâzninân*, by Kerim-ed-din (Calcutta, 1845). The substance of these works is to be found in Garcin de Tassy's *Historic de la Littérature Hindui et Hindustani* (Paris, 1839—1847), which, under the title of *Tabakâti Shuarâi Hindi*, was translated into Hindustani by Kerim-ed-din (Delhi, 1848). In the pure Hindi, we have a rich collection of songs, the *Ragd Sâgar*, by Krishnânanda (Calcutta, 1845).

6. *Sanscrit Anthologies.*—The Sanscrit literature is not so rich in anthologies as the other oriental literatures. If we do not consider the Vedic hymns, and the collections of poems which bear the

general title *Sataka* (a Century), anthological in the proper sense, there is only one work of this kind known—viz., the *Paddhati*, by Sarngadhara, towards the close of the 14th c., in which are gathered together 6000 detached strophes of the most famous epic, lyric, and dramatic poets of India, arranged under certain heads.

7. *Chinese Anthologies.*—From the earliest ages, the Chinese had the custom of sending, along with the yearly tribute to the emperor, copies of such songs as had acquired popularity. Confucius selected from a great number of these 311 of the most beautiful. These are preserved under the name *Shi-king* (Book of Songs), one of the canonical books of the Chinese. This is the oldest A. in the world. A Latin version, by Lacharme, was published at Stuttgart, 1830; a German one, by Rückert, at Altona, 1833. Besides this, there is *Tchao-ming-wen-siouen*, a collection of the finest poems of the time of the Liang dynasty (502—556 A.D.), and also *Thang-shi* poems of the time of the Thang dynasty (618—914 A.D.).

ANTHON, Charles, LL.D., a well-known editor of classics, was born in the city of New York in 1797. At the age of 14, he entered Columbia College, where he pursued his studies with ardor and success for four years. Having been originally intended for the law, he now passed through a preliminary practical instruction in his brother's office, and in 1819 was admitted to the bar of the supreme court of the state of New York. His time, however, was chiefly devoted to classical literature, for which he soon began to acquire a high reputation; and in 1820, when only 23 years of age, he was appointed adjunct-professor of Languages in Columbia College, which office he held for fifteen years. He now commenced that series of classical publications which has done so much to make available for popular purposes the erudite researches of European scholars. His first work was a new edition of Lempriere's *Classical Dictionary*, which was almost immediately re-issued in England. In 1830 appeared his larger edition of Horace, quite a novelty in its way, on account of the superabundant English notes which accompanied the text. In 1833, he issued a smaller edition, for the use of schools and colleges. Virgil, Cæsar, and other ancient writers have been illustrated in the same attractive manner.

A.'s editions of the classics have acquired an extensive popularity; but scholars are disposed to regard them with a kind of learned aversion, both because of the temptations they present to the school-boy to overlook the difficulties of a knotty passage, and of the superfluous and often unimportant matter which is dignified with the title 'commentary' or 'notes.' It cannot be doubted, however, that these works have given a healthy stimulus to the rudimentary study of the ancient authors. In 1831, A. received the degree of LL.D. from his Alma Mater. In 1835, he succeeded Professor Moore in the chair of languages. A. likewise published large works on ancient geography, Greek and Roman antiquities, mythology, literature, &c. He died July 29, 1867.

ANTHONY, St. See Antony, St.

ANTHOXANTHUM. See Vernal Grass.

A'NTHRACITE (Gr. *anthrax*, a coal), a mineral substance of the nature of coal, but consisting of carbon with a minimum amount of hydrogen. It is of a black color, conchoidal fracture, and imperfectly metallic lustre (hence called *glance-coal*). It burns slowly, and without flame, and hence is sometimes called *blind-coal*. Its vegetable origin cannot be doubted. Where strata of common coal have been broken through by trap dikes, the coal next the trap is found to be A., with a gradual transition into the ordinary state; hence geologists look upon A. as natural coke (q.v.), formed by heat or other process from ordinary coal. A. is used as fuel like coke. It is used for the burning of lime and bricks, the reduction of iron, &c. It occurs extensively in Ireland, in parts of Britain, and the Continent; but on the largest scale in the United States. See Coal in Am. Supp.

ANTHRAX. See Splenic Fever.

ANTHROPO'LATRY (Gr.), a term signifying, according to its derivation, the worship of man, and always employed in reproach. Thus, the early Christians accused the heathens of A., because, in their mythology, men were represented as exalted among the gods, although an *apotheosis* (q. v.) was in these cases alleged by their worshipers; and the heathens retorted the charge because of the worship of Christ; the reply to which was the assertion of his divinity. But the term is chiefly known in ecclesiastical history in connection with the employment of it by the Apollinarians (q. v.) against the orthodox Christians of the 4th and 5th centuries, with reference to the doctrine of the perfect human nature of Christ.

ANTHROPO'LOGY (from the Gr. *anthropos*, man), a term signifying that branch of science which has man for its subject. In its proper sense, it is very comprehensive, and of course includes Anatomy, Physiology, Psychology, Ethnology, History, Theology, Æsthetics, &c. The word has, of late, come into very common use. There is an Anthropological Society in London; and a separate anthropological section has been constituted in the British Association. See Anthropology in Am. Supp.

ANTHROPOMO'RPHISM (from the Gr. *anthropos*, man, and *morphe*, a form), the application, in a figurative way, to God, of terms which properly relate to human beings. Thus, in the Holy Scriptures, we read of the eye, the ear, the arm, the hand of God; and of his remembering, forgetting, &c. This A. appears to arise of necessity from our incapacity of forming conceptions of things spiritual, or finding any terms in which to express them, except by analogies derived from things cognizable by our senses, so that even the language of adoration is borrowed from the familiar things of this world. It must be evident, however, that A. employed in an unguarded manner, or too grossly understood, might lead to most serious errror; and a tendency has manifested itself at various times in the history of the Christian Church, to ascribe to the Divine Being a form and parts like those of men. Thus, the Audæans (q. v.) or Audians, a Syrian monastic sect which sprang up in the 4th c., were accused, and, it would seem, justly, of holding that God was possessed of a human shape, and that, when the Bible said that 'God created man in his own image,' the words are to be understood of this shape literally. The same error was at a later period ascribed to the Waldenses, but there is no evidence of the justice of the accusation. A tendency to A. may indeed be regarded as always existing, and so requiring to be guarded against in the mind of every man; but the instances have been rare and isolated, although they have from time to time occurred, in which anthropomorphite views have been fully adopted and openly expressed among Christians. The error of anthropomorphites, has, however, found countenance from the speculations of philosophers. Hobbes, Forster, and Priestley ascribed to the Divine Being a sort of subtile body. Fichte, on the other hand, rejected the very doctrine of the personality of the Divine Being as anthropomorphic, and represented God as the *moral order of the universe;* and Schelling, Hegel, Feuerbach, and Schleiermacher substituted for the objective personality of God a subjective consciousness of God in the human soul.—The term *Anthropopathism* is sometimes employed to denote the ascription to God of human affections and passions, although A., in its most general sense, includes this. The language of Scripture, in the many instances of this kind, must be interpreted according to the same general principles which are applicable in those of A. strictly so called, with the same discrimination of the figurative from the literal, and the same constant recognition of the absolute spirituality and unchangeableness of God; yet so that important truths conveyed by means of such language, and which it is probable could only be conveyed to us by such language, in accordance with our mental constitution, may not be rejected or obscured. And here, it must be confessed, there is greater difficulty than with regard to A. strictly so called.

ANTIARIS and ANTJAR. See Upas.

ANTI'BES (anciently *Antipolis*), a fortified seaport in the department of the Alpes Maritimes, in the S.E. of Provence, France, lat. 43° 34′ N., long. 7° 8′ E. Pop. (1876) 5546. It stands on the east side of a small neck of land called La-Garoupe, lying west from the mouth of the Var, in a fertile district. The harbor is only serviceable, however, for small craft. It is a military station of the third rank, possesses a naval school, and has considerable trade in olives, dried-fruits, salt-fish, &c. The anchovies prepared at A. are held in high estimation. The environs of the town are beautifully adorned with gardens, vineyards, and orchards.

A. is a very old place, having been founded by a colony of Greeks from Massilia (Marseille), of which it was a dependency. In the time of Augustus it was elevated to the rank of an Italian city, and many ruins still testify to its ancient prosperity. After the wreck of the old Roman empire, A. became subject to successive tribes of barbarians from the north. In the 9th c., it was destroyed by the Saracens; in the 16th c., it was fortified by Francis I. and Henry IV.; during the Austrian War of Succession, it sustained a siege of three months (1746). A. closed its gates against Napoleon on his return from Elba. The *Antibes Legion* was a body of foreign troops, chiefly French, kept by the Pope during the French occupation of Rome. It was formed at Antibes.

A'NTICHLORE is the name given to commercial sulphite of soda by paper-makers. When the rags are reduced to a pulp, they are bleached by chloride of lime (bleaching-powder), which thoroughly soaks the pulp, and is very difficult to wash out. The traces of chlorine thus left in the pulp pass into the manufactured paper, and tend to bleach the writing-ink which may be traced thereon. To free the pulp from the residue of the chlorine, some sulphite of soda is employed, and hence the name A., which literally signifies 'against (*anti*) chlorine.'

A'NTICHRIST (from Gr. *anti*, against, and *Christos*, Christ). The general notion of A. as a power opposing itself to the reign

of the Messiah, may be traced back beyond the Christian era. Its origin is perhaps to be found in the prophecy of Ezekiel concerning the doom of Gog and Magog. In accordance with the old saying, 'When need is sorest, help is nearest,' the Jews conceived that, immediately previous to the Messiah's reign, national adversity must be experienced in an extreme degree, and that an agent of Satan would appear, who must be overcome before prosperity could be restored. This was A. The idea is adopted in the New Testament, although the term A. occurs in no place of Scripture, except in the First and Second Epistles of John. From such passages as the prophecy of the Saviour, Matt. xxiv. and Mark xiii., it has been inferred by some that probably the great truth which this conception was intended to shadow forth was similar to that illustrated in the life of 'the Man of Sorrows'—that only through tribulation and strife could the reign of the Messiah be established, that Christ's kingdom, like Christ himself, could be made perfect only through suffering. And with this the language of John in his epistles, and of Paul in passages which seem to embody the same idea, is supposed to accord. Nor is it regarded as a fatal objection to this opinion, that in the Apocalypse the Antichristian power or element is associated with the great heathen capital Rome, symbolically designated Babylon.

But this opinion neither has been nor is generally prevalent. The idea of A. became early associated with that of the Millennium (q. v.), retaining a form very similar to that which it had among the Jews before the advent of the Messiah; and popular opinion has always sought to find for it some actual and definite embodiment. In the 5th c., a popular delusion prevailed, founded on the passage in the Apocalypse, xvii. 8, that Nero was not dead, and would return in the character of A. Since the 16th c., the prevalent opinion among Protestants has been that A. is the Roman Catholic Church; an idea entertained even at an earlier period, as, for instance, by Ludwig of Bavaria, regarding Pope John XXII., by Occam, Wickliffe and his pupil Cobham, and the Bohemian reformer Janow, and which seems to have prevailed to a considerable extent among the Hussites and other opponents of Rome. This opinion has of course been strenuously opposed by Roman Catholic writers, as by Bossuet, who, in his comments on the Apocalypse, ably advocates the opinion that Pagan Rome was A. The opinions of Roman Catholics, however, are much divided upon this subject, many of them maintaining that A. is yet to come and 'to raise the last persecution,' as 'no one has yet appeared to whom we can apply the character which the infallible Word of God declares shall be that of the real A.'—*Keenan's Catechism of the Christian Religion.*

The opinion prevalent among Protestants depends upon the identification of A. with the mystical Babylon of the Apocalypse, and with other symbolic representations in that book, of a power opposed to the cause of Christ, and also with the 'Wicked' one, the 'Man of Sin,' and 'Son of Perdition,' in 2d Thess. ii. Thus it is maintained that a definite embodiment of the idea of A. is to be sought in history, and that this is to be found in the Church of Rome or in the Papal power. And Protestants refer to the gradual growth and development of the errors which they regard as culminating in the Church of Rome, as accordant with the declaration of Paul in 2d Thess. ii., that 'the mystery of iniquity doth already work,' and with that of John, 'even now are there many antichrists.'

There have been, however, among Protestants eminent opponents of this opinion, among whom may be named Grotius. His own opinion was singular, that Caligula, the Roman emperor, was A. In the Greek Church, the term A. has been understood as especially applicable to Mohammed, or to the dominion of the Turks and Saracens. Almost every great or striking event—the arrival of the year 1000; the beginning of the Crusades; the 'black death' and other plagues in the 14th c.; the career of Napoleon in 1805; and even the political movements of 1848 and 1849—has suggested new interpretations of the passages of Scripture regarding A. See REVELATION OF ST. JOHN. See also ANTICHRIST in AM. SUPP.

ANTI-CORN-LAW LEAGUE, the name adopted by an association which concentrated the efforts of the free-trade party in Britain, and enabled them to carry the repeal of the corn-laws, and establish in practice the principle of free-trade. The results thus accomplished will have to be considered under other heads, as CORN-LAWS, FREE-TRADE, &c. This statement is limited to a brief account of the League itself, and its method of working. Associations to obtain the repeal of the corn-laws existed in several places before the embodiment of the League—one especially was founded in London in 1834. In 1838, Mr. Cobden and others took the opportunity of the periodical assemblages of the Manchester Chamber of Commerce for exposing the deleterious influence of the restrictive commercial policy on the manufactures and trade of the country. The friends of free-trade, at the same time, occasionally met in Manchester to discuss and promulgate their views; but it was in the beginning of 1839 that the strength of the party was first drawn to a focus, by the appointment of delegates from the manufacturing districts to proceed to London, and press their principles on the legislature. Mr. Charles Villiers, afterwards President of the Board of Trade, undertook the leadership of their cause in the House of Commons, of which Mr. Cobden, who subsequently served it so effectively, was not then a member. On the 19th of February, Mr. Villiers moved that the House resolve itself into a committee of inquiry on the corn-laws; and again, on the 12th of March, he moved that certain manufacturers be heard by council at the bar of the House against the corn-laws, as injurious to their private interest.

The former motion was rejected by 342 to 195; the latter, by 361 to 172. Immediately on the return of the delegates from their unsuccessful effort, the League was formed. Its constitution dates from the 20th March 1839, when resolutions were adopted, at a meeting in Manchester, for 'the formation of a permanent union, to be called "The Anti-corn-law League," composed of all the towns and districts represented in the delegation, and as many others as might be induced to form anti-corn-law associations, and to join the League.

'Delegates from the different local associations to meet for business from time to time at the principal towns represented.

'With the view to secure unity of action, the central office of the League shall be established in Manchester, to which body shall be intrusted, among other duties, those of engaging and recommending competent lecturers, the obtaining the co-operation of the public press, and the establishing and conducting of a stamped circular, for the purpose of keeping a constant correspondence with the local associations.'

It was resolved that, in addition to the funds which local associations might provide for their own district purposes, £5000 should be put at the disposal of the central body, and that every person or collection of persons, contributing £50, should have one vote in its deliberations. The League collected and distributed large sums of money. Just before its principles became triumphant in the free-trade legislation of 1846, it demanded a quarter of a million, which would have been supplied had it been necessary.

It is of the greatest moment that the cause of the success of the League should not be misunderstood: it triumphed not by possessing money, but by teaching a scientific truth. It was a great organization for educating the country in political economy. The leading principles of this science were so little known when the League began, and had been so effectually promulgated before its end, that a majority of the parliament who, in 1841, had been elected for the support of protection, were converted to free-trade, the conversion including the prime-minister, Sir Robert Peel. The key-note to the literature of the League was struck by the beautiful logical exposition of free-trade in General Thompson's *Catechism of the Corn-laws*, which, with other tracts, was profusely dispersed over the country, while a large staff of lecturers aided in the task of education. Thinking to serve their cause in the same manner, the Protectionist party, at a meeting held in the Duke of Somerset's house, on 17th February 1844, founded 'The Agricultural Protection Society of Great Britain.' This body had inexhaustible wealth at command, but in reality its exertions only helped to further the cause of free-trade, by promoting discussion, and prompting people to work out the question for themselves.

ANTICO'STI, an island in the Gulf of St. Lawrence, with lighthouses at different parts of the coast, between lat. 49° and 50° N., and long. 61°40′ and 64°30′ W. It is estimated to contain 2500 sq. m. Neither to the settler nor to the mariner is A. of any value. It is destitute of harbors, the north shore being mountainous, and the south low and beset by shoals; while, to increase the danger, the neighboring currents are said to be capricious. The climate is severe; while the surface is an alternation of rocks and swamps. The principal inhabitants are the keepers of the lighthouses. Pop. (1871) 102. The island is surrounded by considerable salmon, trout, cod, and herring fisheries. It is a valuable resort for seal and bear hunting. The most extensive peat deposits in the Dominion are found in A. Marl also exists in most of the small lakes and ponds along the coast.

A'NTIDOTE (Gr. given against), a counter-poison. See POISONS.

ANTI'GONE, a character of the heroic age of Greece, daughter of Œdipus by his own mother Jocasta, was sister to Eteocles, Polynices, and Ismene. She accompanied her father in his exile into Colonus in Attica, and after his death, returned to Thebes. Eteocles, the king, had banished his brother Polynices, who, coming back with an army, engaged him in single combat. Both fell, and Creon, who after their death had become tyrant of Thebes, issued an edict forbidding their interment. A. alone dared to disobey. She buried Polynices, and was in consequence seized by the monster, who shut her up, either in the same tomb with her brother, or in a subterranean cave, where she perished. This sentence threw Hæmon, son of Creon, who was betrothed to A., into such despair that he destroyed himself. A., as the ideal of feminine duty and filial devotion, has been immortalized by

Sophocles in his dramas of *Œdipus at Colonus* and *Antigone*.—A., daughter of Eurytion, and wife of Peleus, who hanged herself upon hearing a false report of her husband's marriage to Sterope, daughter of Acastus.—A., daughter of Laomedon, and sister of Priam, who, having offended Juno by comparing her own beauty to that of the goddess, had her hair turned into snakes, which so tormented her, that the gods, in compassion, changed her into a stork.

ANTI-FEDERALISTS. See PARTIES, POLITICAL, in AM. SUPP.

ANTI'GONUS. Of the numerous persons who bore this name, the most celebrated was the son of Philip of Elymiotis, and one of the generals of Alexander the Great. In the division of the empire which followed the death of his master, A. received the provinces of Phrygia-Major, Lycia, and Pamphylia. Being accused of disobedience by Perdiccas, who wished to gain possession of all the territories left by Alexander, A. entered into alliance with Craterus, Antipater, and Ptolemæus, and declared war against Perdiccas in 321 B.C. In the same year, Perdiccas was assassinated by his own soldiers; but A. carried on the war against Eumenes, to whom Perdiccas had given rule over Paphlagonia and Cappadocia. Eumenes, and afterwards Seleucus, who reigned in Syria, were deposed by A., whose ambition and cupidity now knew no bounds. He seized the treasures of Alexander kept at Ecbatana and Susa, which he refused to share with his allies, Ptolemæus, Cassander (son of Antipater) and Lysimachus. All the other generals now allied themselves against him, and a long series of contests took place in Syria, Phœnicia, Asia Minor, and Greece, which ended with the battle of Ipsus, in Phrygia (301 B.C.), when A. was slain in his eighty-first year.

ANTI'GONUS GONA'TAS was the son of Demetrius Poliorcetes, king of Macedonia, and grandson of the great Antigonus. On his father's death, B.C. 283, various claimants for the throne appeared, and much confusion ensued, the result of which was that the royal power fell into the hands of Ptolemæus Ceraunus, who, however, soon after perished in a battle with the Gauls, when A. G. at length became ruler of the country (277 B.C.) and governed precariously in that age of intrigue, dissimulation, and violence, for 33 years. He was twice expelled from his dominions by a hostile force from Epirus, but found refuge and assistance in the Peloponnesus. The close of his career was comparatively peaceful. He died in 243 B.C.

ANTI'GUA, a West India island, the most important of the Leeward Islands (see ANTILLES), and the residence of the governor-in-chief of the British portion of the group. It lies in W. long., between 61° 44′ and 61° 58′; and in N. lat., between 17° 2′ and 17° 13′. Its area is 170 square miles; or 122,000 acres, of which about 100,000 are under cultivation. In 1871, the population of A. was 34,344; in 1881, it was 34,964—about 205 persons to the square mile. It was first settled in 1632, having till then remained, in fact, uninhabited on account of the great scarcity of fresh water. It has twice suffered severely from earthquakes—in 1689 and 1843; while of hurricanes also, the other heavy scourge of the group, A. has had its full share. Numerous islets, rocks and shoals border the shore, so that, generally speaking, access is difficult and dangerous. But St. John's, the chief town, stands at the head of a safe and capacious bay, which unfortunately, however, does not admit large vessels. English Harbor is, on the whole, a more commodious port, and has been selected as the station of the Royal Mail Steam-packets. It is said to be capable of receiving the largest ships in the British navy.

A. is chiefly of tertiary formation. The south and west show grauwacke, porphyry, trap, breccia, amygdaloid, and basaltic greenstone; the north and east exhibit calcareous marl and coarse sandstone, interspersed with blocks of limestone; while the interior presents argillaceous strata and irregular beds of coarse flints.

Besides provisions, generally almost sufficient for its own consumption, A. produces large quantities of sugar, molasses, and rum. In this respect, the emancipation of the slaves appears to have been rather beneficial than otherwise. In 1880, the total tonnage of vessels (exclusive of the coasting-trade) which entered and cleared A. was 189,395, and of these the majority were British. The total value of imports was, in the same year, £161,543; of exports, £267,153. The value of the sugar exported was, in 1856, £301,740; in 1863, £199,832; in 1867, £87,393; and in 1873, £121,778. The revenue of A. is about £40,000, the expenditure a little less.

In connection generally with the emancipation of the slaves, of whom immediately previous to the abolition of slavery, A. had about 30,000, it seems to have occupied a prominently creditable position. Immediately after the passing of the imperial statute on the subject, the local legislature, rejecting the intermediate and probationary state of apprenticeship, proclaimed unqualified freedom for 1st August 1834—a bold measure, which proved to be as judicious as it was humane.

ANTI'LLES, a term used to designate generally the whole of the West India Islands, except the Bahamas. Generally speaking, they stretch eastward from the Gulf of Mexico to about the meridian of the Gulf of Paria; then southward to the Gulf of Paria itself; and lastly, westward to the Gulf of Maracaybo. Primarily, however, they are regarded not as three sections, but as two—the Greater A., to the north and west; and the Lesser, to the east and south. This distinction, which obviously involves considerations of position as well as of magnitude, will be found to indicate also a difference of organic structure.

The Greater A., reckoning from the west, are: Cuba (Spanish), Jamaica (British), Hayti (independent), and Porto Rico (Spanish). They extend, in W. long. from 84° 58′ to 65° 40′, and in N. lat. from 23° 9′ to 17° 40′—the higher of these two parallels being only 21′ or about 25 miles within the Tropic of Cancer. On the lowest estimate, the area is said to amount to 70,000 square miles. The Greater A. appear to be of primitive formation, presenting lofty granitic mountains. In Jamaica, however, there are many hills of calcareous origin.

The Lesser A. may be divided into two chains—the eastern, trending round from the eastward of Porto Rico to the Gulf of Paria; and the southern, stretching away in a direction nearly parallel with that of the Greater A., along the coast of Venezuela as far as the Gulf of Maracaybo. By the Spaniards, followed by some other nations, the latter chain is termed the Leeward Islands, and the former the Windward Islands. In English and French phraseology, however, the Leeward Islands are all those to the north of 15° N. lat., and the Windward Islands all those south of that parallel.

In the latter sense of the name, the Leeward Islands, reckoning from the north, come in pretty nearly the following order: Virgin Islands (Danish and British), Anegada (British), Anguilla (British), St. Martin (French and Dutch), St. Croix (Danish), Saba (Dutch), St. Bartholomew (French), St. Eustatius (Dutch), Barbuda (British), St. Christopher's (British), Nevis (British), Antigua (British), Montserrat (British), Deseada (French), Guadaloupe (French), Marie Galante (French), Dominica (British). They extend in W. long. from 65° 30′, at the W. extremity of the Virgin Isles, to 61° 23′, at the E. extremity of Dominica; and in N. lat. from 18° 48′, at the N. extremity of Anegada, to 15° 10′, at the S. extremity of Dominica. The area is about 5000 sq. m.

The Windward Islands, reckoning from N. to S., and then from E. to W., may be given as follows: Martinique (French), St. Lucia (British), Barbadoes (British), St. Vincent (British), Grenadines (British), Grenada (British), Tobago (British), Trinidad (British), Testigos (Venezuelan), Margarita (Venezuelan), Tortuga (Venezuelan), Blanquilla (Venezuelan), Buen Ayre (Dutch), Curaçoa (Dutch), Aruba (Dutch). They extend in W. long. from 59° 20′, at the E. of Barbadoes, to 70° 11′, at the W. of Aruba; and in N. lat. from 11°, at the S. of Margarita, to 14° 55′, at the N. of Martinique. Their entire area cannot exceed 1500 sq. m. The Windward Islands, in the Spanish sense of the term, are otherwise called the Caribbees; and hence the sea which they cut off from the open Atlantic is called the Caribbean sea (q. v.).

The Lesser A., as a whole, appear to be chiefly of coral formation, or of volcanic origin. Many of them contain extinct craters; and, though not destitute of harbors, their coasts are rendered in a great measure inaccessible by reason of reefs.

The A. generally—but perhaps the Lesser more so than the Greater—are subject to hurricanes and earthquakes. Their principal productions are sugar, rum, cotton, coffee, &c. The individual islands will be found noticed in detail in their respective places.

The name A. is generally supposed to have been given by mistake to the West Indian Islands. Before the discovery of America by Columbus, a tradition existed that far to the west of the Azores there lay a land called Antilla, whose position was vaguely indicated in the maps of the early cosmographers. Only eight months after Columbus's return, we find one Peter Martyr writing that the islands which the great navigator had touched upon, must be the Antillæ; and it is certain that Cuba and Hayti were known as such before a single link in the Caribbean chain was discovered.

ANTILOPE. See ANTELOPE.

ANTI-MASONS. See PARTIES POLITICAL, in AM. SUPP.

A'NTIMONY—symb. *Sb* (Lat. *Stibium*); equiv. 122—is a brittle metal of a flaky, crystalline texture, and a bluish-white color. It is readily reduced to powder by ordinary pulverization; when heated to 840° F., it fuses, and thereafter being allowed to cool, it solidifies in rhombohedral crystals, which are isomorphous with those of arsenic. Heated in a retort, where the oxygen of the air is excluded, as in an atmosphere of hydrogen, A. volatilizes as the vapor of the pure metal. When raised in temperature in contact with the air, it burns with a white light—combining with the oxygen of the atmosphere, and forming copious white fumes of the teroxide of A., or 'flower of A.' The metal is a bad conductor of heat and electricity, but may be used, in conjunction with bis-

muth, in the construction of thermo-electric piles. Exposed to the air at ordinary temperatures, A. does not tarnish or rust; and this property, combined with the hardness of the metal and of its compounds, renders A. of essential service in the useful arts, in the construction of alloys, such as Britannia metal, type metal, and plate pewter. It is likewise employed in the preparation of the large concave mirrors used in astronomical observations; and in casting of bells, to make them harder and whiter, and to give them a clearer and stronger sound.

The principal natural sources of A. are—*grey* or *crude* A. of commerce, which is the impure tersulphuret of A. (SbS_3); and *native* A., in which it occurs in the metallic state associated with silver, iron, and other metals. The extraction of A. from its ores is mainly carried on at Linz, in Germany, where the sulphide of A. is found extensively, and in Great Britain which receives its supply of ore from Singapore and Borneo, commonly as ballast. The process consists in heating the crude ore, covered with charcoal, on the bed of a furnace, when the sulphide of A. fuses, leaving unmelted the earthy impurities; and thereafter the liquid is drawn off into iron moulds, where it solidifies into cakes or loaves. The latter are reduced to coarse powder, placed on the bed of a reverberatory furnace, and heated with access of ordinary air containing oxygen, when the sulphur passes away as gaseous sulphurous acid (SO_2), leaving behind the A. as the teroxide (SbO_3). The roasted mass is now mixed with one-sixth of its weight of powdered charcoal, the whole moistened with a solution of carbonate of soda, and raised to bright redness in crucibles, when the metal A. trickles to the bottom, and the impurities are left above in the spent flux or scoria, which is known in the arts by the name of *crocus* of A.

The compounds of A. are numerous: with oxygen it forms (1) the *teroxide* of A., or *white A. ore* (SbO_3) which enters into the composition of tartar emetic; (2) *antimonious acid* (SbO_4), which forms one of the components of Dr. James's powders; (3) *antimonic acid* (SbO_5), a very insoluble compound, obtained by acting upon the metal with concentrated nitric acid. With sulphur, A. forms the *tersulphide* (SbS_3) already referred to as a natural ore of the metal, and which when roasted at a temperature sufficient to fuse it, passes into the mixed teroxide and tersulphide of A. known commercially as the *glass* of A. A native oxysulphide, of a pretty red color, is called *red A. ore*. When the ordinary sulphide of A. is boiled with potash, or the carbonate of potash, it dissolves; and thereafter, on boiling, deposits a reddish-brown substance, known as *mineral kermes*. The liquid from which the deposit has fallen, if treated with hydrochloric acid, throws down an orange precipitate of *golden sulphide* of A.

There is also a chloride of A. ($SbCl_3$) prepared by heating sulphide of A. and hydrochloric acid together, and which has the common name of *butter* of A. It is generally obtained as an oily liquid, of the consistence of melted butter, and of a golden yellow color. Mixed with olive oil, it is used by gunmakers as *bronzing salt*, to impart a yellow color to gun-barrels. The surface of the metal is afterwards polished by a burnisher, or coated with a varnish.

The various compounds of A. are used as medicinal agents, both in human and veterinary practice, especially the *tartar emetic*, a compound of teroxide of A., potash, and tartaric acid (SbO_3,KO,T).

ANTINO'MIANISM (Gr. *anti*, against, and *nomos*, law), the doctrine or opinion that Christians are freed from obligation to keep the law of God. It is generally regarded by the advocates of the doctrine of justification by faith, as a monstrous abuse and perversion of that doctrine, upon which it usually professes to be based. From several passages of the New Testament, as Rom. vi., and 2 Pet. ii. 18, 19, it would seem that a tendency to A. had manifested itself even in the apostolic age; and many of the Gnostic sects were really antinomian, as were probably also some of the heretical sects of the middle ages; but the term was first used at the time of the Reformation, when it was applied by Luther to the opinions advocated by John Agricola. Agricola had adopted the principles of the Reformation; but in 1527 he found fault with Melancthon for recommending the use of the law, and particularly of the ten commandments, in order to produce conviction and repentance, which he deemed inconsistent with the gospel. Ten years after, he maintained in a disputation at Wittenberg, that as men are justified simply by the gospel, the law is in no way necessary for justification or for sanctification. The 'Antinomian Controversy' of this time, in which Luther took a very active part, terminated in 1540 in a retractation by Agricola; but views more extreme than his were afterwards advocated by some of the English sectaries of the period of the Commonwealth; and, without being formally professed by a distinct sect, A. has been from time to time reproduced with various modifications. It ought, however, to be borne in mind, that the term A. has no reference to the *conduct*, but only to the *opinions* of men; so that men who practically disregard and violate the known law of God, are not therefore antinomians; and it is certain enough that men really holding opinions more or less antinomian, have in many cases been men of moral life. It is also to be observed that the term A. has been applied to opinions differing very much from each other. In its most extreme sense it denotes the rejection of the moral law as no longer binding upon Christians; and a power or privilege is asserted for the saints to do what they please without prejudice to their sanctity; it being maintained that to them nothing is sinful; and this is represented as the perfection of Christian liberty. But besides this extreme A., than which nothing can be more repugnant to Christianity, there is also sometimes designated by this term the opinion of those who refuse to seek or to see in the Bible any positive laws binding upon Christians, and regard them as left to the guidance of gospel principles and the constraint of Christian love, an opinion which, whatever may be thought of its tendency, is certainly not to be deemed of the same character with the other. Probably, the A. that does not arise out of a dislike of morality, usually originates in mistaken notions of Christian liberty, or in confusion of views as to the relation between the moral law and the Jewish law of ceremonial ordinances.

ANTI'NOUS, a beautiful youth of Claudiopolis, in Bithynia. He was page to the Emperor Hadrian, and the object of his extravagant affection, accompanying him in all his travels, but was either drowned accidentally in the river Nile, or as some suppose, committed suicide, from a loathing of the life he led, in 122 A.D. His memory and the grief of the emperor were perpetuated by many statues and bass-reliefs, of which several are very beautiful, especially two now in Rome—one found in the baths, and the other in the villa of Hadrian. 'In all figures of A.,' says Winckelmann, 'the face has a rather melancholy expression; the eyes are large, with fine outlines; the profile is gently sloped downwards; and the mouth and chin are especially beautiful.' The city of Besa, in the Thebais, near to which A. was drowned, was also rebuilt by Hadrian, and the name of Antinoöpolis conferred upon it, in memory of his favorite. A. was further enrolled amongst the gods, and temples erected to him in Egypt and Greece.

A'NTIOCH, the ancient capital of the Greek kings of Syria, was the most magnificent of the sixteen cities of that name built by Seleucus Nicator. Its situation was admirably chosen. The river Orontes, issuing from the mountains of Lebanon, flows north as far as the 36th parallel of latitude, and then south-west into the Levant. On the left bank of the river, after it has taken this last direction, and at a distance of twenty miles from the sea, lay the famous city, in the midst of a fertile and beautiful plain, ten miles long by five broad. By its harbor, Seleucia, it had communication with all the maritime cities of the West, while it became, on the other hand, an emporium for the merchandise of the East; for behind it lay the vast Syrian desert, across which traveled the caravans from Mesopotamia and Arabia. On the north, the plain of A. is bounded by the mountain-chain of Amanus, connected with the south-eastern extremity of Mount Taurus; and on the south, which is more rocky, by the broken declivities of Mount Casius, from which the ancient town was distant less than two miles. In early times, a part of the city stood upon an island, which has now disappeared. The rest was built partly on the plain, and partly on the rugged ascent towards Mount Casius. The slopes above the city were covered with vineyards, while the banks of the river displayed, as they do even at the present day, a gorgeous profusion of eastern fruit-trees. The ancients called it 'A. the Beautiful,' 'the Crown of the East,' &c. It was a favorite residence of the Seleucid princes and of the wealthy Romans, and was famed throughout the whole world for the abundance of its conveniences and the splendor of its luxury. It received from Strabo the name of *Tetrapolis*, on account of three new sites having been successively built upon, and each surrounded with a wall. Its public edifices were magnificent. The principal were—the Palace; the Senate-house; the Temple of Jupiter, burnished with gold; the Theater, Amphitheater, and Cæsarium, besides an aqueduct, a public promenade, and innumerable baths. At the beginning of the Roman empire, it was as large as Paris, and for many generations after, continued to receive numerous embellishments from the emperors. Nor did its glory fade immediately after the founding of Constantinople, for though it then ceased to be the first city of the East, it rose into new dignity as a Christian city. Ten councils were held in it.

Churches sprang up exhibiting a new style of architecture, which soon became prevalent; and even Constantine himself spent a considerable time here, adorning it, and strengthening its harbor, Seleucia. The Antiochenes themselves, however, brought about the ruin of their beautiful city. They were famous, above all other people in ancient times, for their biting and scurrilous wit, and for their ingenuity in devising nicknames; and when the Persians, under Chosroes, invaded Syria in 538 A.D., the Antiochenes could not refrain from jesting at them. The Persians took ample revenge by the total destruction of the city, which, however, was rebuilt by Justinian. The next important event in its history was

its conquest by the Saracens in the 7th c. In the 9th c. it was recovered by the Greeks under Nicephorus Phocas, but in 1084 it again fell into the hands of the Mohammedans. The Crusaders besieged and took it on the 3d of June 1098. At the close of the 13th c., the sultan of Egypt seized it: since then, it has undergone a variety of vicissitudes, and at present forms a portion of Syria, in the eyalet of Aleppo. Its modern name is *Antakieh*. It exhibits almost no traces of its former grandeur, except the ruins of its walls built by Justinian, and of the fortress erected by the Crusaders. Its manufactures are few and unimportant. In 1872 A. was mostly destroyed by an earthquake, and the population, which was then estimated at about 17,000, was in consequence greatly reduced.

ANTI'OCHUS, a common Greek name, was borne by thirteen kings of Syria, four kings of Commagene (a small country between the Euphrates and Mount Taurus), and many other persons of note (see Smith's *Dictionary of Greek and Roman Biography*). A. Soter, the first of the Syrian dynasty, or Seleucidæ, as they were called, from their founder, was the son of Seleucus, the general and one of the successors of Alexander. A. was the fruit of one of those marriages which Alexander celebrated at Susa between his generals and the princesses of Persia. His mother's name was Apama. From this fact we gather that A. was probably born in 324 B.C. For the earlier career of A., see SELEUCUS. On the murder of his father in 280 B.C., A. succeeded him in his dominions, but he afterwards permitted Antigonus Gonatas to retain possession of Macedonia on his marrying Phila, a daughter of Seleucus. A. was much occupied in wars with the Gauls, who invaded Asia Minor, and, on one occasion, is said to have gained a victory over them by the help of his elephants, from which circumstance he derived the name of Soter (Saviour). He was subsequently killed in a battle with the Gauls (261 B.C.), and was succeeded by his son A. II. This A. is mentioned in the Book of Daniel (xi. 6) as the king of the north—the king of the south being Ptolemy, whose daughter, Berenice, A. had been compelled to marry. On the death of Ptolemy, A. recalled his former wife, Laodice; but she, in revenge for the insult which she had received, caused A. to be murdered, along with Berenice and her son. A. lost the provinces of Parthia and Bactria.

But the most distinguished of the Seleucidæ was A. III., surnamed the Great, who was the son of Seleucus Callinicus, and grandson of the preceding. In his earlier wars with Ptolemy, Philopator A. was generally successful; and though he was defeated in a great battle fought near Gaza, he afterwards, by his victory over the Egyptian general, Scopas, obtained entire possession of Palestine and Cœle-Syria. In this war he was assisted by the Jews, to whom he granted many privileges. Fearing the power of the Romans, A. at length concluded a peace with Egypt, betrothed his daughter Cleopatra to the young king Ptolemy, and gave her Cœle-Syria and Palestine as a dowry. The formidable enemy which he thus hoped to escape encountered him at a later period of his career. Having conquered Philip of Macedonia, the Romans no longer dreaded a war with A., and accordingly sent him an embassy, demanding the surrender of the Thracian Chersonese, and of the places which he had conquered from Ptolemy, whose guardian the Romans had become. In 191 B.C., he was entirely defeated by the consul Acilius Glabrio at Thermopylæ, and compelled to return to Asia. Having a second time tried the fortune of war, he was defeated by Scipio, who had crossed over into Asia, and very severe terms were imposed on him. He found so much difficulty in raising money to pay the tribute the Romans demanded, that he was led to plunder a temple in Elymais, when the people rose against him, and killed him (187 B.C.). The fate of A. was foretold in the Book of Daniel (xi. 18, 19).

A. IV., (175—164 B.C.) surnamed Epiphanes, by his tyranny and sacrilege, excited the Jews to a successful insurrection under their leaders Mattathias, Judas Maccabæus, and other members of that heroic family. The monstrous life of A. is recorded in the books of the Maccabees. The last of the Seleucidæ, A. XIII., surnamed Asiaticus, was deprived of his kingdom by Pompey, who reduced Syria to a Roman province (65 B.C.).

ANTIPÆDOBA'PTIST, a term exactly designating one who objects to child-baptism. As such a one, however, is generally known in this country under the name Baptist, see BAPTIST.

ANTI'PAROS (anciently called Olearosor Oliaros), one of the Cyclades islands, celebrated for a stalactitic cave, is separated from Paros by a narrow strait. It contains about 400 inhabitants, and forms a part of the eparchy of Naxos. A. is 7 miles in length by about 3 in breadth; it is scantily supplied with water, but the flats in the north and west are tolerably fertile. Corn and wine are cultivated, but not to any great extent. The principal occupation of the inhabitants is fishing. From Kastron, the only village in the island, the distance to the celebrated grotto is about an hour and a half's ride.

This wonderful cave is not alluded to by any Greek or Roman writer whose works are extant, but must have been visited by the curiosity-hunters of antiquity, for, in 1806, Colonel Leake deciphered a Hellenic inscription which contained the names of those who had descended into it in ancient times. It is situated in the side of a mountain on the S. coast of the island, which is described as a mass of white marble. The top or entrance of the cave has a striking appearance; but the sloping descent is rather dangerous, on account of the cord by which the traveler holds being extremely slippery from constant humidity. The bottom once reached, and the grotto entered, there is presented to the eye as dazzling a specimen of stalactitic formation as can well be conceived—the roof, floor, and walls of the various chambers, all glittering with the most gorgeous incrustation, though it is said that the smoke of the torches and the constant fingering of visitors, are sullying the primitive purity of the massive columns. It is believed that there are other caves of equal splendor in the vicinity which have not yet been discovered. The height of the known cavern is 80 feet; its length and breadth more than 300; but it seems the eye can only take in at once a length of 150 feet and a breadth of 100. The grotto was first made known to the modern world in 1673, by the then French ambassador to the Porte, M. de Nointel.

ANTI'PATER. Of the many persons who bore this name in antiquity, the most celebrated was one of the generals and confidential friends of King Philip of Macedon. When Alexander led his troops into Asia, he left A.—who, along with Parmenion, had endeavored to dissuade him from the expedition—as governor of Macedonia. A. discharged the duties of this office with great ability, suppressing the insurrections in Thrace and Sparta; but Olympias, the mother of Alexander, who entertained a dislike to A., prevailed on her son to appoint Craterus as regent of Macedonia. Alexander, prompted also, it is supposed, by his own jealousy of A., consented, but died before the change was carried into effect; and A. was left to share with Craterus the government of Alexander's territories in Europe. The government of Macedonia was assigned to him; and soon after, he was called upon to defend himself against an alliance of the Grecian states. With the assistance of Craterus—on whom he afterwards bestowed his daughter Phila in marriage—and to a certain extent of Leonnatus, he succeeded in reducing the allies to subjection. Democracy at Athens was abolished, a garrison admitted into Munychia, and the leaders of the popular party put to death. When Demosthenes was summoned to the presence of A., he took poison, which for some time he had been carrying on his person, and died in the temple of Poseidon (322 B.C.). This war was followed by another with Perdiccas, who was also his son-in-law, in which A. again was successful. After the murder of Perdiccas in 321 B.C., A. was appointed to the supreme regency of the kingdom, and the guardianship of Alexander's children. He died at an advanced age, in B.C. 318 or 319, leaving the regency to Polysperchon, to the exclusion of his own son Cassander.

The others of this name were: I. A., second son of Cassander, king of Macedonia, who lived in the 3d c. B.C.—II. A., the father of Herod the Great. He flourished in the days of Pompey and Julius Cæsar, was a firm friend of the Romans, and about the year 47 B.C. was appointed procurator of Judea. He was poisoned in 43 B C. by one whose life he had twice saved.—III. A., grandson of the former, and son of Herod the Great by his first wife Doris, a worthless prince, who was perpetually conspiring against the life of his brothers, until his trial and condemnation at Jerusalem before Quintilius Varus, the Roman governor of Syria. He was executed in prison five days before Herod died, and in the same year with the massacre of the innocents at Bethlehem.

A. was likewise the name of various eminent men in ancient times—physicians, philosophers, historians, poets, mathematicians, and grammarians.

ANTI'PATHY is the term applied to a class of cases in which individuals are disagreeably affected by, or violently dislike, things innocuous or agreeable to the majority of mankind. These peculiarities are no doubt sometimes acquired in early life by injudiciously terrifying children with some object, the mental impression becoming permanent. A large class of persons have an A. to animal food, and from childhood refuse to taste it. In others, again, the aversion is limited to one kind of meat, as veal or pork; others are averse to eggs or milk. Nor is this feeling a conscious caprice, which an exertion of the will might remove; for it is generally found that contact with the object of the A. is resented by the bodily economy, and symptoms of poisoning are rapidly produced. Some are affected with these symptoms who have no mental aversion to the article. We read of a countess who had a liking for beef-udder, but directly it touched her lips they became swollen. There is also the case of a boy, who, 'if at any time he ate of an egg, his lips would swell, in his face would rise purple and black spots, and he would froth at the mouth.' Some medicines affect particular persons dangerously, even when given in very minute doses: a single grain of mercury has been known to induce a profuse salivation, with destruction of the jaw-

bones. On others, medicines have a peculiar effect—astringents may purge. Every summer, in Great Britain, persons may be seen with the most distressing irritation of the nasal and palpebral mucous membranes, produced by the exhalations arising from the fields during the inflorescence of the hay-crop. In others, an asthmatic condition is induced by the same cause. The air of some places has a similar influence on individuals: one gentleman was always attacked with asthma if he slept in the town of Kilkenny, and another rarely escaped a fit of that complaint if he slept anywhere else.

The most remarkable antipathies are those affecting the special senses. Nearly all persons have a loathing at reptiles, but some few *faint* on *seeing* a toad or lizard, others on seeing insects. 'The Duke d'Epernon swooned at sight of a leveret—a hare did not produce the same effect. Tycho Brahé fainted at sight of a fox, Henry III. of France at that of a cat, and Marshal d'Albert at a pig.'—*Millingen.*

Hearing a wet finger drawn on glass, the grinding of knives, or a creaking wheel, is sufficient to produce fainting in some. *Smelling* musk or ambergris throws some into convulsions; and we have seen how articles of food affect others—often, no doubt, owing to perverted taste. The *touch* of anything unusually smooth has the same effect sometimes. Zimmerman records the case of a lady who was thus affected by the feeling of silk, satin, or the velvety skin of a peach.—This subject is also noticed under IDIOSYNCRASY.

ANTIPHLOGI'STIC (Gr. *anti*, against, and *phlego*, I burn), a term applied to remedies, and also to regimen, that are opposed to inflammation; such as blood-letting, purgatives, low diet, &c.

A'NTIPHON, the earliest of the ten Attic orators in the Alexandrine canon, was the son of Sophilus the Sophist, and born at Rhamnus in Attica 480 B.C. In his youth, the reputation of Gorgias, the most showy and insincere of all the Greek rhetoricians, was at its height. A. soon became convinced of the worthlessness of that oratory which the fashion of the time so highly valued, and resolved to introduce a new and better kind. He labored to make his arguments clear, solid, and convincing, so that it might be impossible for the judges who listened to the speeches he wrote to refuse their assent to his propositions. His success was unmistakable. Although he never made a public appearance as a pleader in the courts of justice, but contented himself with writing speeches for others to deliver, he acquired great influence, which he did not fail to exert for the furtherance of his political principles. To him must be attributed the overthrow of the Athenian democracy (411 B.C.), and the establishment of the oligarchical government of the Four Hundred; for although Pisander figured prominently before the people in this revolution, the whole affair, according to Thucydides—one of A.'s pupils in oratory, and a man admirably fitted to judge of such a point—was secretly planned by him. The oligarchical government did not prosper. Dissensions quickly broke out among the Four Hundred, and six months after, Alcibiades the brilliant demagogue, was recalled. A. was brought to trial for treason, in having attempted to negotiate peace with Sparta. He is said to have made a noble defence of himself. Thucydides affirms that an abler was never made by any man in a similar position. It was his first and last oration. He was condemned to death; his property was confiscated, his house razed to the ground, his remains forbidden interment in Attica, and his children for ever declared incapable of enjoying civic privileges. Of the 60 orations of A. which the ancients possessed, only 15 have come down to us. Three of these are written for others, and are greatly admired for their clearness, purity, and vigor of expression; the remaining 12 appear to have been intended as specimens of school-rhetoric for his pupils. They are not held in equal estimation with the others.

ANTI'PHONY, a name given by the ancient Greeks to a species of musical accompaniment in the octave, by instruments or voices, in opposition to that executed in unison, which they called *Homophony*. A. is also the name of a species of sacred song, sung by two parties, each responding to the other; a practice which was cultivated in the early ages of the Hebrews, Greeks, and Romans. Many of the Psalms of David show that antiphonal singing was then in use. Its introduction into the Greek Church is ascribed to Ignatius, Bishop of Antioch, in the 2d c.; and Ambrosius, Bishop of Milan, is said to have introduced it into the Western Church, in the 4th c. The dividing of the antiphonies into verses, with rules regarding the same, is attributed to Pope Celestin in 432. Pope Gregory I., in 590, prepared the first regular *Antiphonarium* (see *Durandi Rationale Divinorum Officiorum*, Mainz, 1459). It was early a custom, which became especially common after the 13th c., to date deeds with the beginning words of the A. (*Introitus*), which in these times served for the day of the month and of the week. The Reformed Christian Churches of Germany and England have still retained a certain degree of antiphonal singing. The chanting of the Psalms in the English cathedral service is an imitation of the ancient antiphony.

ANTI'PODES, a word of Greek origin, signifying, literally, those who have their feet over against each other. As applied to geography, the term means the inhabitants of any two opposite points of the globe, or, in other words, the dwellers at the opposite extremities of any diameter of the earth. From this primary relation, there necessarily arise many secondary relations. A. must be on one and the same meridional circle, separated from each other by half the circumference. Being on one and the same meridional circle, they must differ in long. exactly 180°, with the exception of the poles themselves, as having no longitude at all; and being separated from each other by half the circumference, they must be equi-distant from the equator in opposite directions. Take Edinburgh, as an example, in lat. 55° 57′ N., and long. 3° 11′ W.; its A. must be in lat. 55° 57′ S., and in long. 183° 11′ W., or rather in 176° 49′ E.—which is merely an undistinguishable spot in the Antarctic or Southern Ocean. Take, as another example, London, in lat. 51° 30′ N., and long. 0° 5′ W. Its A. must be in lat. 51° 30′ S., and in long. 180° 5′ W., or rather 179° 55′ E.—coinciding pretty nearly with a small island to the south-east of New Zealand. This small island, in honor rather of London than of itself, has appropriated the term A. as its own peculiar name.

Between A. in general there necessarily exist also other secondary relations. With reference to the earth's daily rotation, the noon of the one side must be the midnight of the other; while, with regard to its annual revolution, the summer and the autumn of the one side must be the winter and the spring of the other. With respect, however, to the former contrast, some explanation may be required.

This, for instance, being Wednesday in London, was last midnight in that city the noon of Tuesday or of Wednesday at A. Island? The answer is, that, according to circumstances, it may be held to be either the one or the other. In going eastward—that is, in meeting the sun—one, from day to day, anticipates every noon and every midnight in the proportion of 4′ of time to 1° of long., or of 12 hours of time to 180° of long.; so that, on reaching A. Island from London by the Cape of Good Hope, the middle of Tuesday night, by Greenwich reckoning, is actually regarded on the spot as the noon of Wednesday. In going westward, again—that is, in leading, as it were, the sun—one, from day to day, postpones every noon and every midnight in the same proportion as above; so that, on reaching A. Island from London by Cape Horn, the middle of Tuesday night, by Greenwich reckoning, is actually regarded on the spot as the noon of Tuesday. In fact, navigators in opposite directions, meeting at any intermediate point whatever of the earth's circumference, always differ in their computation of time by a whole day, or 24 hours. In two cases, this has been permanently exemplified: the Spaniards at the Philippines, who have come from the east, are a day behind the Portuguese in Macao, who have come from the west; while, on the north-west coast of America, the Russians from the west were a day in advance of the British from the east.

A'NTIPOPE was a pontiff elected in opposition to one canonically chosen. The first antipope is reputed to be Laurentius, elected 398, in opposition to Symmachus. Several emperors of Germany set up popes against those whom the Romans had elected without consulting them. Otho the Great displaced successively two bishops of Rome; and when Sylvester III. had expelled the simoniacal and profligate pope Benedict IX., Conrad II., king of Germany, brought back this worthless pastor, who hastened to sell his dignity to Gregory VI. There were now, consequently, three popes, and their number was increased to four by the election of Clement II. in 1046. Shortly after, Alexander II. found a rival in Honorious II.; and in 1080 the same unseemly spectacle was witnessed, when Henry IV., emperor of Germany, elevated to the papal chair, Guibert of Ravenna, under the title of Clement III., in opposition to his implacable adversary, Gregory VII. But after the death of Gregory, Clement was himself opposed successively by Victor III. and Urban II., and at last died at a distance from Rome, having just beheld the exaltation of Pascal II. as the successor of Urban. During the 12th c., several antipopes flourished, such as Gregory VIII. and Honorious III.

On the death of the latter, France began to intermeddle in these disgraceful strifes, and upheld the cause of Innocent II. against Anaclet; while the kings of Sicily, on the other hand, more than once set up a pontiff of their own against the choice of the emperors. Between 1159 and 1378, there were four antipopes; but the most remarkable epoch is 'the great schism of the West,' produced by these disedifying rivalries in 1378—a schism which divided the Church for fifty years. It broke out after the death of Gregory XI., at the election of Urban VI., whom the voice of the Roman people, demanding an Italian pope, and not one who should fix his pontificate, like several of his predecessors, at a distance from Rome, had elevated to the papal throne. The French cardinals objected, withdrew to Provence, and elected a new pope, under the name of Clement VII., who was recognized by France, Spain, Savoy, and Scotland; whilst Italy, Germany, England, and the whole north of Europe, supported Urban VI. These two popes

excommunicated each other; nor did they even fear to compromise their sacred character by the most cruel outrages and the most odious insults. The schism continued after their death, when three popes were elected by different parties, all of whom were deposed by the Council of Constance in 1415, and Cardinal Colonna elected in their room, under the title of Martin V. The last antipope was Clement VIII. With him the schism ceased. These divisions are often alleged as an argument against the doctrine of papal infallibility; but Catholics consistently affirm that the privilege of infallibility is only claimed in matters of doctrine, and has no relation to questions of fact, such as disputed succession, or canonicity of election. See POPE.

A'NTIQUARIES, SOCIETY OF. Under this name, associations of learned men, established for the exclusive purpose of cultivating the study of antiquities, exist in the principal countries of Europe and in America—at London, Edinburgh, Paris, Rome, Vienna, Copenhagen, &c. The London Society of A. received its charter in 1751, but had commenced its meetings as early as 1707; minutes began to be kept in 1718. Long previous to this, in 1572, an Antiquarian Society was established by Archbishop Parker and Sir Robert Cotton. It was dissolved about 1604 by King James, who regarded the inquiries of the A. with suspicion. The present 'Society of A. of London' consists of a president, a council of 21, and several hundred Fellows. It has published a number of valuable works, among the most interesting of which is a series of Anglo-Saxon and early English literary remains. The Scottish Society of A. was founded in 1780. It has published several volumes of Transactions and Proceedings, with numerous cartularies, besides having collected a valuable museum, which has now become national property, and is arranged for permanent exhibition at the expense of the government. The *Société des Antiquaires de France* took that name in 1814, having been founded in 1805 as the *Académie Celtique*. With the change of name, the sphere of the Society's labors was greatly enlarged. It has published many important works. A similar institution is the *Société des Antiquaires de Normandie*, founded at Caen in 1824. The Copenhagen Society of A. is a body of high reputation. See ARCHÆOLOGY.

ANTI'QUE. As the term ancients is commonly applied to the Greeks and Romans, the word A. is used with reference to their works of art, especially their incomparable sculptures. The A. Style in works of art is distinguished by critics from the Romantic or Medieval, and also from the Modern. The sculpture of the Greeks is characterized by freshness, originality, and ideality; and the phases it underwent have their parallels in the development of the literature and general culture of that people. In the earliest times, the statues had a rigid, formal character, and looked more like the idols of barbarous nations than deities in human form; then came stern, Titan-like forms, corresponding with the Prometheus of Æschylus; next, the sculptures of Phidias, Polycletes, and Polygnotus—like the characters in the dramas of Sophocles—present to us humanity in its purest and noblest ideal forms. Then, as Euripides in poetry left the old domain of destiny, and derived motives and action from ordinary human passions, so statuary descended from the ideal to a closer resemblance to the forms of actual life; as we see in the works of Praxiteles and Lysippus. Afterwards, when Aristophanes introduced comedy, forms of every-day life began to appear in sculpture; and thus a gradual transition was made from the art of the Greeks, which was ideal, in the true sense of the word, to that of the Romans, which was real, monumental, and portrait-like. The Romans were the realists of the ancient world; their indigenous philosophy was of a popular kind; their poetry, so far as it was national, was satire; and their works of art may be regarded as monuments and portraitures of real life.

ANTI-RENTERS. See PARTIES, POLITICAL, in AM. SUPP.

ANTIRRHINUM. See SNAPDRAGON.

ANTISCORBUTICS. See SCURVY.

ANTISEPTICS (*anti*, against, *septikos*, causing putrefaction) are substances which prevent or arrest putrefaction and analogous fermentive changes. It has been proved that Putrefaction (q. v.), fermentation of grape-juice (*vinous fermentation*), of milk, (*lactic fermentation*), and many, though probably not all other fermentations, depend upon the presence of microscopic vegetable organisms (see GERM THEORY). To prevent these processes, then, it is necessary either (1) to exclude these organisms altogether; (2) to interfere with conditions which permit of their development; or (3) to destroy their vitality.

(1) These organisms, or their germs, are present in ordinary air; but it has been shown by Pasteur, Tyndall, Lister, Roberts, and others, that if air be filtered through cotton wool, or (if moving slowly) through a fine bent tube, it may be allowed to come in contact with putrescible substances, if these themselves contain no living organisms or germs, without causing putrefaction. This method, however, has had no important practical applications.

(2) Their growth may be arrested (*a*) by a low temperature. Thus large quantities of fresh meat are imported from America, and even Australia and New Zealand, in chambers cooled to near the freezing-point. Carcases of the long extinct mammoth, with the flesh still present, have been found in the ice-cliffs of Siberia. The longer time that meat, milk, &c., keep in cold than in hot weather is familiar. (*b*) By absence of moisture. Thus, if the contents of an egg be thrown out on a plate, and thoroughly dried in an oven, the whole becomes of a hard, horny consistence, and may be kept in this state for years. If soaked in water, it will soon begin to putrefy. In the same way meat may be kept fresh by thoroughly drying it. The preservation of fruits, &c., in strong syrup is an example of a similar action.

(3) The vitality of these organisms may be destroyed (*a*) by heat; e. g., meat and other eatables can be preserved for an indefinite time if they are boiled and hermetically sealed while still hot in tin vessels (see PRESERVES); (*b*) by various chemical substances. Some of the most important are common salt and saltpeter, used in curing fish, pickling meat, &c.; alcohol, in preserving zoological specimens, vegetable essences, fruits, &c.; sulphurous acid, boracic acid, and arsenious acid; many salts, as chloride of zinc (Burnett's solution, q. v.), permanganate of potash (Condy's fluid, see under MANGANESE), sulphate of copper (blue vitriol), corrosive sublimate, nitrate of silver; chlorine (given off by chloride of lime), iodine, iodoform (CHI_3), glycerine, boroglyceride ($C_3H_5Bo_3$), eucalyptus oil, thymol, creasote, carbolic acid, salicylic acid, tannic acid, quinine, the patent preparation 'sanitas,' charcoal (both vegetable and animal), dry mould, used in the earth-closet system (see SEWAGE EARTH-CLOSET). All these substances act directly or indirectly as poisons to the organisms which produce putrefaction, &c.; most of them are either poisonous or very unpalatable to man, and cannot therefore be used in preserving food. Many of them are, however, used in the arts to arrest the decomposition of putrescible substances; e. g., in the manufacture of size for writing-paper from scraps of hides, sulphite of soda or antichlore, containing sulphurous acid, is added; hides are preserved by salt, or, when tanned, by tannin, a compound of tannic acid; timber is found less liable to decay if charged with an antiseptic, such as sulphate of copper, chloride of zinc, corrosive sublimate, or creasote. It is placed in a steam-box, so that the air contained in its pores is replaced by steam; the whole casing is then closed tight, and allowed to cool; the steam condenses and leaves a vacuum in and around the wood. If one of these substances is then introduced, it finds its way into the innermost pores of the timber (see also WOOD-PRESERVING).

But next to the preservation of food, the most important purposes for which antiseptic methods and substances are used, are the *prevention of infectious diseases*, and the *treatment of wounds*.

The properties of the infectious matter of infectious diseases are closely analogous to those of the organisms that lead to putrefaction, &c.; and even in cases where its organic nature has not been proved (see GERM THEORY), can be rendered inert by a proper use of A., or by exposure to a high temperature. Thus anything that has come near the patient suffering from an infectious disease, and discharges from his person, can be made harmless by carbolic acid, chloride of zinc, or some other antiseptic; his bedding is roasted in an oven at a temperature of 212° F. or more; the room where he has been treated is fumigated with chlorine or sulphurous acid; and so the disease is prevented from spreading. This is, in fact, one of the chief aims of medical practice at the present day (see DISINFECTANTS).

Many of the evil effects which follow wounds and surgical operations are due to the presence of organisms (see PYÆMIA); and the effects of their antiseptic treatment, introduced by Mr. Lister, have been marvelous (see CARBOLIC ACID.).

ANTISPASMO'DICS. See SPASM.

ANTI'STHENES, founder of the Cynic school of philosophy, was the son of A., an Athenian. He fought in his youth at Tanagra (426 B.C.), survived the battle of Leuctra (371 B.C.), and died at Athens at the age of 70. After listening to the teaching of Socrates, he gave up rhetoric, which he had followed at first as a disciple of Gorgias, and applied himself wholly to philosophy. He was present at the death of Socrates, and never forgave his persecutors. A. held that virtue mainly consists in voluntary abstinence from pleasure, and in a stern contempt of riches, honors and even learning. Opinions of still greater extravagance are ascribed to A., but it is probable that they were rather extreme views, which he put into the mouths of the interlocutors in his dialogues, than expressions of those which he himself entertained. Even in his condemnation of pleasure, he excepted such as springs from the soul, or is founded on true friendship. In consistency with his teaching, A. appeared as a beggar, clad in ragged garments—an eccentricity which Socrates is said to have reproved by saying, 'I see your pride through the holes in your cloak.' The singularity affected

by A. gained many imitators, and among them Diogenes, who chose to live in a tub, and surpassed the master himself in Cynic practice. After the death of Socrates, A. taught moral and practical philosophy in the Athenian gymnasium Cynosarges, from which, it is said, his school derived its title. His writings—among them a polemical work against Plato—have mostly perished. Such fragments as remain have been collected by Winckelmann (*A., Fragmenta*, Turici, 1842). Ritter classes A. with the 'imperfect Socraticists.'

ANTI'THESIS (*tithemi*, to place, *anti* against), a figure of speech in which words are placed in direct opposition to each other, to produce a strong contrast. Thus Lessing, in criticism on a book, says: 'It contains many good things, and many new; but the good are not new, and the new are not good.' A., when naturally and moderately employed, gives liveliness to style; but, like all strong figures of speech, becomes wearisome when too often repeated.

ANTITRINITA'RIAN, one who denies the doctrine of the Trinity. An A. differs from a Unitarian only in this respect, that his objection to the doctrine in question is made on philosophical, while that of the latter is made on theological grounds. A Unitarian is one who accepts the Bible as inspired, but does not find in it the doctrine of the Trinity; an A. is, or may be, a philosophical theist, who denies the inspiration of Scripture. Mohammed, from the stand-point of a new and hostile religion, also denied this great Christian dogma. He announced himself, with fierce emphasis, an A.; and his followers to the present day are characterized by the intensity of their monotheism. See UNITARIAN and SOCINIAN.

A'NTITYPE, a Greek word, literally signifying a type or figure which corresponds to some other type or figure. In its theological sense, it denotes, not a type, but the person in whom any prophetic type is fulfilled; thus, Christ is called the A. of the paschal lamb. See TYPE.

A'NTIUM, one of the most ancient cities of Latium, stood on the coast 34 miles S.S.E. from Rome. Being favorably situated for commerce and piracy, it became, under the Volscians, into whose hands it had fallen, one of the most powerful enemies of rising Rome, until finally subdued (338 B.C.). It became a favorite resort of the wealthy Romans, and some of the most famous remains of ancient art have been discovered among the ruins of their villas and palaces; such as the Apollo Belvedere, and the Borghese Gladiator. It was the birthplace of the Emperors Caligula and Nero; and the latter constructed a splendid port by means of two moles enclosing a basin two miles in circumference. Antium was completely destroyed by the Saracens during the middle ages; and it was only in the 17th c. that the modern village of PORTO D'ANZO arose, the population of which does not exceed 500.

ANTIVARI, a seaport on the coast-district assigned to Montenegro by the Treaty of Berlin in 1878. It was formerly Albanian, and is 18 miles N.W. of Scutari. It has a good harbor, shut against war-ships. Pop. about 7000.

ANT-LION, the larva of an insect (*Myrmeleon formicarium*) of the order Neuroptera, remarkable for its habits, which have been carefully observed by some of the ablest naturalists of Europe. It inhabits sandy districts, is not known in Britain, and is more common in the south of Europe than in the north. The perfect insect is about an inch long, and has a considerable general resemblance to a dragon-fly. The larva is rather more than half an inch long; it has a very large abdomen, and a small head, which, however, is furnished with two very large incurved mandibles. It has six legs, but is incapable of rapid locomotion, and generally moves backwards. It feeds upon the juices of insects, particularly of ants, in order to obtain which it excavates with the greatest ingenuity a funnel-shaped hole in sandy ground, and lies in wait at the bottom, all but its mandibles buried in the sand. Insects which approach too near the edge of the hole, then become its prey, by the loose sand giving way, so that they fall down the steep slope. If they do not fall quite to the bottom, but begin to scramble up again, the A. throws sand upon them by jerking its head, and so brings them back. It employs its head in the same way to eject their bodies from its pit, after their juices have been sucked, and casts them to a considerable distance; and by the same means throws away the sand in excavating its hole, first ploughing it up with its body, and then placing it upon its head by means of one of its fore-legs. It always begins by working round the circular circumference of its future hole, and gradually narrows and deepens it; turning quite round after each time that it works round the hole, so as to employ next time the fore-leg of the other side. When it meets with a stone which it cannot remove, it deserts the excavation, and begins another. The pit is rather more than two inches deep. After about two years the larva spins its cocoon.

Ant-lion:
a, larva; *b*, perfect insect.

ANTOMMARCHI, FRANCESCO a well-known physician and native of Corsica, was born in the second half of the 18th c. He owes his celebrity almost entirely to his intimacy with Napoleon Bonaparte during the exile of the latter in St. Helena. In 1818, he was induced to leave Florence, where he held the office of anatomical dissector in the Hospital of Santa Maria Nuova of Florence, and to become private physician to the banished emperor. There was at first little cordiality between the two; but subsequently Bonoparte conceived a high regard for his countryman, and at his death left him 100,000 francs. In 1821, A. returned to Europe, and in 1826 published at Paris *Les Derniers Moments de Napoleon*, a work which has been very extensively read. He now became involved in a dispute with the heirs of Mascagni—his old anatomical professor—regarding certain anatomical plates which he announced as on the eve of publication. The heirs affirmed that A.'s lithographed drawings were mere copies from the plates of Mascagni, and the controversy went on briskly for some time, till Paris grew tired of it, when it gradually died away and was forgotten. On the breaking out of the Polish revolution, A. departed for Warsaw, where he received the appointment of general inspector of military hospitals. He soon returned to Paris, where he published a cast of Napoleon's head, which he affirmed to have taken when the emperor was on his death-bed. This declaration again involved him in a hot dispute with the phrenologists, who were not satisfied with the conformation of the cranium, and therefore cast suspicion—some of them apparently not altogether ill-founded—on the veracity of A's. statements. Harassed by the attacks of his adversaries, and sick of further controversy, A. about 1836, resolved to emigrate to America. He died at San Antonio, in Cuba, on the 3d of April 1838.

ANTON ULRICH, second son of Duke Ferdinand Albert of Braunschweig-Wolfenbüttel (till 1735, Braunschweig-Bevern, the title by which the prince was first known in Russia), was born in 1714. When the Russian Empress Anna was looking out for an alliance for her niece, Anna Carlowna, Princess of Mecklenburg-Schwerin, the influence of Austria led her to chose A. U. Accordingly, he came to Russia in 1733, was appointed colonel of a cuirassier regiment, and placed in the receipt of a considerable pension. The marriage was, however, long delayed. The princess showed a decided distaste for the insignificant character of the bridegroom-elect, and only married him to avoid a still more hated union with the son of Biron. The birth of the Prince Ivan took place in 1740, a year after the marriage. About the same time, the empress falling dangerously sick, appointed the infant prince her successor, and Biron regent. After her death, A. U. made some feeble attempts to reverse this appointment, which only led to the punishment of those supposed to have instigated them, and to his own military degradation. Biron's conduct towards the parents of the infant prince becoming unbearably insolent, Anna appealed in despair to General Münnich, who put a sudden end to Biron's sway, and declared the grand-duchess and her husband regents. After a few months, Anna ungratefully overthrew Münnich. After his fall, as little unity prevailed between the ministers at the helm as between herself and her husband, and the government was looked upon as both a foreign and a contemptible one. Then came the revolution of the 5th December, 1741, which in one night raised Elizabeth (q.v.) to the throne. A. U. and his consort were exiled, and lived long at Cholmogory, in the government of Archangel. Three children were born to them in exile. Anna died in 1746. Catharine II. offered A. U. his freedom, but he declined it. Ultimately, he grew blind. The exact year of his death is uncertain, but it is supposed to have taken place about 1780. Catharine offered to his children an asylum in Jutland, where they all died in comfortable circumstances.

ANTONE'LLI, GIACOMO, a distinguished cardinal, was born on the 2d of April, 1806, at Sonnino, a village situated near the Pontine Marshes. His father, a woodcutter, sent A. to be educated at the Grand Seminary of Rome, where he proved himself one of the cleverest students of his time. He gained the favor of the late Pope Gregory XVI., who named him a *prelato*, and gave him some excellent ecclesiastical appointments. In 1841, A. became Under-secretary of State to the Ministry of the Interior; in 1844, Second Treasurer; and in the following year, Finance Minister of the two Apostolic Chambers. Pope Pius IX. having mounted the papal throne in 1846, raised A., during the next year, to the dignity of Cardinal-deacon of St. Agatha alla Suburra. In 1848, A. was President and Minister of Foreign Affairs in a liberal cabinet, which framed the famous *Statuto* or Constitution, proclaimed in 1848, the principal articles of which were so very soon eluded. In the Œcumenical Council, which began its sittings in 1869, A. showed great tact and ability in restraining the zeal and impetuosity of his impulsive master. He died in 1876.

ANTONE'LLO (of Messina), a painter who holds a prominent position in the history of Italian art, was born probably about 1414, in Sicily. In his day, the paintings of Johann van Eyck (of Flanders) enjoyed a wide celebrity, and several specimens were brought to Naples, where A. saw one of them. Admiring the new style of oil-painting, he traveled into Flanders, and learned the secrets of the art from Van Eyck. Afterwards, he settled in Venice, and was the first Italian who painted in oil-colors, in which he gave instruction to many artists. He died probably in 1493. His works are now rather scarce. One, in the Museum at Berlin bears the date 1445.

ANTONI'NUS, MARCUS AURELIUS, the son of Annius Verus and Domitia Calvilla, was born at Rome on the 20th of April 121 A.D. His original name was Marcus Annius Verus. On the death of his father, he was adopted by his grandfather, who spared no pains to render him pre-eminent in every art and science. His fine qualities early attracted the notice of the Emperor Hadrian, who used to term him, not *Verus*, but *Verissimus*, and who conferred high honors on him, even while a child. When only seventeen years of age, he was adopted, along with Lucius C. Commodus, by Antoninus Pius, the successor of Hadrian; and Faustina, the daughter of Pius, was selected for his wife. In the year 140 A.D. he was made consul; and from this period to the death of Pius, in 161 A.D., he continued to discharge the duties of his various offices with the greatest promptitude and fidelity. The relation which subsisted between him and the emperor was of the warmest and most familiar kind. On his accession to the throne, he strikingly illustrated the magnanimity of his character, by voluntarily sharing the government (which Pius had left in his last moments, and the senate offered to him *alone*) with young Commodus, who henceforth bore the name of Lucius Aurelius Verus, and to whom he gave his daughter Lucilla in marriage. Towards the close of 161 A.D., the Parthian War broke out, and Lucius, a young man of vigorous bodily habits, was sent to the frontiers of the empire, to repel the incursions of the barbarians; but intoxicated with the enervating pleasures of the East, he obstinately refused to go beyond Antioch, and intrusted the command of the army to his lieutenant Cassius, who gained several brilliant victories. Lucius returned to Rome (166 A.D.), and enjoyed a triumph to which he had no real claim; for all the great achievements of the war were accomplished by his officers, while he was reveling in the most extravagant licentiousness. In the meantime, Marcus Aurelius had distinguished himself by the prudence and energy with which he administered affairs at home. A formidable insurrection had long been preparing in the German provinces; the Britons were on the point of revolt, and the Catti waiting for an opportunity to devastate the Rhenish provinces.

Within Rome itself raged a pestilence, believed to have been brought home by the troops of Lucius; frightful inundations and earthquakes had laid large portions of the city in ruins, destroyed the granaries in which were kept the supplies of corn, and thus created almost universal distress, which stimulated to an incalculable degree the terror which the citizens entertained of their savage enemies. To allay the popular perturbation, Marcus resolved to go forth to the war himself. Hecatombs were offered to the offended gods, and the Roman legions set out for the north. Marcus and Lucius were, for the time, completely successful. The pride of the Marcomanni, and the other rebellious tribes inhabiting the country between Illyria and the sources of the Danube, was humbled, and they were compelled to sue for peace in 168 A.D.; in the year after which Lucius died. The contest was renewed in 170 A.D., and may be said to have continued with little intermission during the whole life of the emperor. Although fond of peace, both from natural disposition and philosophical culture, he displayed the sternest vigor in suppressing the revolts of the barbarians; but in order to accomplish this, he had to enrol amongst his soldiery vast numbers of gladiators and slaves, for his army had been thinned by the ravages of the plague. His headquarters were Pannonia, out of which he drove the Marcomanni, whom he subsequently all but annihilated in crossing the Danube. The same fate befell the Jazyges; but the most famous as well as the most extraordinary of all his victories, was the miraculous one gained over the Quadi (174 A.D.), and which gave rise to copius discussion amongst Christian historians and others. Dion Cassius's account is, that the Romans were perishing of thirst in the heat of summer, when suddenly the cloudless sky darkened, and abundant showers fell, of which the soldiers were taking advantage when the barbarians attacked, and would have cut them to pieces, if a storm of hail and fire had not descended on the former. That some extraordinary phenomenon occurred is evident, for there is a letter of Aurelius still extant in which he commemorates the event; and the emperor was a man incapable of uttering a falsehood, not to mention that there was an entire army living to disprove the statement, if untrue. The effect of this remarkable victory was instantaneously and widely felt. The Germanic tribes hurried from all quarters to make their submission, and obtain clemency; but the practical advantages that might have resulted from it were nullified by a new outbreak in the East, occasioned through the infamous treachery of his own wife, which demanded his presence; and though suffering from failing health, he was obliged to leave Pannonia.

Before his departure, however, he learned that the ambitious governor, Avidius Cassius, who had rebelled against him, and seized the whole of Asia Minor, had perished by assassination. The conduct of Marcus Aurelius on hearing of his enemy's death was worthy of the sublime virtue of his character. He lamented that the Fates had not granted him his fondest wish—to have freely pardoned the man who had so basely conspired against his happiness. Like Cæsar in similar circumstances, but in a more purely humane spirit, he received the head of his murdered adversary with quite opposite feelings to what had been anticipated, rejecting the bloody gift with all the loathing of a benevolent nature, and even shrinking from the presence of the murderers. On his arrival in the East, he exhibited the same illustrious magnanimity. He burned the papers of Cassius, without reading them, so that he might not be at liberty to suspect any as traitors; treated the provinces which had rebelled with extreme gentleness; disarmed the enmity, and dispelled the fears of the nobles who had openly favored his insurgent lieutenant. While pursuing his work of restoring tranquillity, Faustina died in an obscure village at the foot of Mount Taurus; and her husband (and this was perhaps the single frailty of his character), though undoubtedly conscious of her glaring profligacy and infidelity, paid the most lavish honors to her memory.

On his way home, he visited Lower Egypt and Greece, displaying everywhere the noblest solicitude for the welfare of his vast empire, and drawing forth from his subjects, who were astonished at his goodness, sentiments of the profoundest admiration and regard. At Athens, which this imperial pagan philosopher must have venerated as a pious Jew did the city of Jerusalem, he showed a catholicity of intellect worthy of his great heart, by founding chairs of philosophy for each of the four chief sects—Platonic, Stoic, Peripatetic, and Epicurean. No man ever labored more earnestly to make that heathen faith which he loved so well, and that heathen philosophy which he believed in so truly, a vital and dominant reality. Towards the close of the year 176 A.D., he reached Italy, and celebrated his merciful and bloodless triumph on the 23d of December. In the succeeding autumn, he departed for Germany, where fresh disturbances had broken out among the restless and volatile barbarians. He was again successful in several sanguinary engagements; but his originally weak constitution, shattered by perpetual anxiety and fatigue, at length sunk, and he died either at Vienna, or at Sirmium, on the 17th of March, 180 A.D., after a reign of twenty years.

Marcus Aurelius A. was the flower of the stoical philosophy. It seems almost inexplicable that so harsh and crabbed a system should have produced as pure and gentle an example of humanity as the records of heathen—we had almost said, Christian history, can show.

Perhaps, as a modern philosophic theologian suggests, it was because stoicism was the most solid and practical of the philosophic theories, and the one which most earnestly opposed itself to the rapidly increasing licentiousness of the time, that the chaste heart of the youth was drawn towards it. At twelve years of age, he avowed himself a follower of Zeno, Epictetus, &c. Stoics were his teachers—Diognotus, Apollonius, and Junius Rusticus; and he himself is to be considered one of the most thoughtful teachers of the school. Oratory he studied under Herodes Atticus and Cornelius Fronto. His love of learning was insatiable. Even after he had attained to the highest dignity of the state, he did not disdain to attend the schools of Sextus of Chæronea. Men of letters were his most intimate friends, and received the highest honors both when alive and dead. His range of studies was extensive, embracing morals, metaphysics, mathematics, jurisprudence, music, poetry, and painting. Nor must we forget that these were cultivated not merely in the spring-time of his life, when enthusiasm was strong, and experience had not saddened his thoughts, and when study was his only labor, but during the tumults of perpetual war, and the distraction necessarily arising from the government of so vast an empire. The man who loved peace with his whole soul, died without beholding it, and yet the everlasting presence of war never tempted him to sink into a mere warrior. He maintained uncorrupted to the end of his noble life his philosophic and philanthropic aspirations. After his decease, which was felt to be a national calamity, every Roman citizen, and many others in distant portions of the empire, procured an image or statue of him, which more than a hundred years after was still found among their household gods. He became almost an object of worship, and was believed to appear in dreams, like the saints of subsequent Christian ages.

There is one feature in his character, however, which it would be dishonest to pass over—his hostility, namely, to Christianity. He was a persecutor of the new religion, and, it is clearly demonstrated, was cognizant, to a certain extent at least, of the atrocities

perpetrated upon its followers. Numerous explanations have been offered of his conduct in this matter. The most popular one is, that he once allowed himself to be led away by evil counselors; but a deeper reason is to be found in that very earnestness with which he clung to the old heathen faith of his ancestors. He believed it to be true, and to be the parent of those philosophies which had sprung up out of the same soil: he saw that a new religion, the character of which had been assiduously, though perhaps unconsciously, misrepresented to him, both as an immoral superstition, and a mysterious political conspiracy, was secretly spreading throughout the empire, and that it would hold no commerce with the older religion, but condemned it, generally in the strongest terms. It was, therefore, comparatively easy, even for so humane a ruler, to imagine it his duty to extirpate this unnaturally hostile sect.

Mr. John Stuart Mill finds in this tragical error of the great emperor a most striking warning against the danger of interfering with the liberty of thought. What he says is so completely in harmony with the above conception of the motives of Marcus Aurelius, and is in itself so eloquent, that no apology is required in quoting the passage: 'If ever any one possessed of power had grounds for thinking himself the best and most enlightened among his contemporaries, it was the Emperor Marcus Aurelius. Absolute monarch of the whole civilized world, he preserved through life not only the most unblemished justice, but what was less to be expected from his stoical breeding, the tenderest heart. The few failings which are attributed to him were all on the side of indulgence; while his writings, the highest ethical product of the ancient mind, differ scarcely perceptibly, if they differ at all, from the most characteristic teachings of Christ. This man, a better Christian, in all but the dogmatic sense of the word, than almost any of the ostensibly Christian sovereigns who have since reigned, persecuted Christianity. Placed at the summit of all the previous attainments of humanity, with an open, unfettered intellect, and a character which led him, of himself, to embody in his moral writings the Christian ideal, he yet failed to see that Christianity was to be a good and not an evil to the world, with his duties to which he was so deeply penetrated. Existing society he knew to be in a deplorable state. But such as it was, he saw, or thought he saw, that it was held together, and prevented from being worse, by belief and reverence of the received divinities. As a ruler of mankind, he deemed it his duty not to suffer society to fall in pieces, and saw not how, if its existing ties were removed, any others could be formed which could again knit it together. The new religion aimed openly at dissolving these ties; unless, therefore, it was his duty to adopt that religion, it seemed to be his duty to put it down. Inasmuch, then, as the theology of Christianity did not appear to him true, or of Divine origin; inasmuch as this strange history of a crucified God was not credible to him, and a system which purported to rest entirely upon a foundation to him so wholly unbelievable, could not be foreseen by him to be that renovating agency which, after all abatements, it has in fact proved to be; the gentlest and most amiable of philosophers and rulers, under a solemn sense of duty, authorized the persecution of Christianity. To my mind, this is one of the most tragical facts in all history. It is a bitter thought, how different a thing the Christianity of the world might have been, if the Christian faith had been adopted as the religion of the empire, under the auspices of Marcus Aurelius, instead of those of Constantine. But it would be equally unjust to him, and false to truth, to deny, that no one plea which can be urged for punishing Anti-christian teaching, was wanting to Marcus Aurelius for punishing, as he did, the propagation of Christianity. No Christian more firmly believes that atheism is false, and tends to the dissolution of society, than Marcus Aurelius believed the same things of Christianity; he who, of all men then living, might have been thought the most capable of appreciating it. Unless any one who approves of punishment for the promulgation of opinions, flatters himself that he is a wiser and better man than Marcus Aurelius—more deeply versed in the wisdom of his time—more elevated in his intellect above it—more earnest in his search for truth—let him abstain from that assumption of the joint infallibility of himself and the multitude, which the great A. made with so unfortunate a result.' See Renan's *Marc Aurèle* (1882).

ANTONI'NUS PIUS, TITUS AURE'LIUS FULVUS, a Roman emperor (138—161 A.D.), was born in the reign of Domitian (86 A.D.). The family of A. was originally from Nemausus, now Nimes, in Gaul. A. inherited great wealth, and early gave proof of excellent qualities. In 120 he was made consul; afterwards was sent by Hadrian as proconsul into Asia, where the wisdom and gentleness of his rule won for him a higher reputation than had been enjoyed by any of his predecessors. By his wife Faustina he had four children, of whom three died, leaving a daughter, Faustina, afterwards wife of Marcus Aurelius. In 138 he was adopted by the Emperor Hadrian, in consequence of merit alone, and came to the throne in the same year. The reign of A. was proverbially peaceful and happy. In his private character, he was simple, temperate, and benevolent; while in public affairs he acted as the father of his people. The persecution of Christians, which was continued during his reign, was partly stayed by his mild measures. He was little engaged in war, excepting in Britain, where he extended the power of Rome, and built a wall between the Forth and the Clyde, as a defence against invasions by the predatory inhabitants of the north; but he was frequently employed in arbitration and general counsel on the affairs of foreign states. 'Happy the nation which has no history.' The reign of A. illustrates this saying, for by the justice, wisdom, kindliness,

Copper Coin of Antoninus Pius, commemorative of his Victories in Britain, from one in the British Museum.

and courtesy of the emporer, his vast empire was preserved from the crimes, conspiracies, insurrections, and bloodshed, the recording of which formed the largest part of the historian's work in the dark centuries of the Roman empire. It is said that only *one* senator was impeached during A.'s lifetime. Literature received great encouragement; the laws were improved; commerce extended; the means of communication were facilitated by the repair of roads, bridges, &c.; new sanitary regulations were introduced; and a taste for architecture fostered in the citizens. The epithet PIUS was conferred on him on account of his conduct in defending the memory of his predecessor Hadrian against certain dishonoring measures brought forward by the senate. A. died in 161 A.D. The column raised to his memory by his adopted son and successor, Marcus Aurelius Antoninus (q. v.), was discovered in 1709, and now exists only in fragments. The so-called Pillar of Antoninus, now in the *Piazza Colonna* at Rome, is that raised by the senate in honor of Marcus Aurelius, after his victory over the Marcomanni

ANTONI'NUS, ITINERARY OF (*Antonini Itinerarium*), a valuable geographical work, containing the names of all the places and stations on the principal and cross roads of the Roman empire, with their distances from each other in Roman miles. It has been usually attributed to the Emperor M. Aurelius Antoninus, whence its name. The testimony, however, of the Greek geographer Æthicus, author of the *Cosmographia*, assures us that a general survey of the Roman empire was commenced 44 B.C., in the consulship of Julius Cæsar and M. Antonius, and completed in the reign of Augustus, when the results of the survey received the sanction of the state. These results, it is with some probability inferred, are embodied in this *Itinerary*, which, it is further supposed, received additions and amendments in the time of the Antonines. Subsequent improvements were made down to the reign of Diocletian. The best editions are those of Wesseling (Amst. 4to, 1735), and Parthey (Berl., 1848).

ANTONI'NUS, WALL OF (*Antonini Vallum*), a barrier erected between the Firths of Forth and Clyde by the Romans, in the reign of Antoninus Pius, to restrain the encroachments of the native tribes. A fragment of a Roman pillar, which was at one time in the university of Edinburgh, fixes the date of its execution to 140 A.D. The superintendence of the work is generally attributed to the imperial legate Lollius Urbicus. Its length was about 27 English miles—the eastern termination being, according to two different suppositions, at Carriden, or at Kinniel, on the Forth; the western, at Old Kilpatrick, or at Dunglass Castle, on the Clyde. The work consisted of a ditch about 20 feet deep and 40 wide, a rampart of earth and stone about 20 feet high and 24 feet thick at the base, and on the inner or south side of the rampart a paved military road. It was protected by a chain of nineteen forts, with watch-towers between. The line of the wall may still be traced to a considerable extent. The most perfect fragments are at Elf Hill, on the moor of Bonnieside, about a mile and a half from Castlecary; within the park of Callander House, near Falkirk; and on the slopes at Inveravon, not far from the railway station at Polmont. It is commonly designated *Graham's Dike*—a name given also to more than one ancient ditch and rampart in England. (See SEVERUS, WALL OF). For best accounts of the Wall of Antonine, see Roy's *Military Antiquities of the Romans in North Britain* (1793), and Stuart's *Caledonia Romana* (2d ed., 1852).

ANTO'NIUS, MARCUS (MARK ANTONY), the Roman triumvir, born in 83 B.C., a descendant of one of the oldest patrician families, was the son of the Prætor M. Antonius Creticus, and,

on the side of his mother Julia, was related to Julius Cæsar. His youth was wasted in dissipation, and finding himself pressed by numerous impatient creditors, he escaped to Greece in 58 B.C., where, for a short time, he listened to the teaching of Athenian philosophers and orators. His studies here were soon interrupted by the Proconsul Gabinius, who appointed him as leader of his cavalry. In the campaign against Aristobulus in Palestine, and in Egypt, A. distinguished himself by his courage and activity, and ingratiated himself with the soldiers. After assisting Cæsar in Gaul, he went to Rome in 50 B.C., to advance the interests of the former, who stood in great danger from the hostility of the oligarchical party, and was appointed an augur, and chosen one of the tribunes of the people. In the following year, on account of his adherence to the party of Cæsar, he was expelled from the curia, and fled to Cæsar, who made use of this event as a pretext for his war against Pompey. At the outbreak of this war, A. received the appointment of commander-in-chief in Italy. In the battle of Pharsalia, he commanded the left wing of Cæsar's army. In 47, he was made Master of the Horse by Cæsar, who left him to govern Italy during his absence in Africa. Antony, as usual, disgraced himself; got perpetually drunk; divorced his wife, and married an actress, with whom he paraded offensively through the chief towns of the peninsula. In 44 B.C., he married Fulvia, the widow of Clodius; was made consul, and vainly endeavored to prevail on the Romans to recognize Cæsar as emperor. After the assassination of Cæsar, he played the part so well described by Shakspeare; and by his funeral oration, and the well-timed display of Cæsar's bloody robe, so wrought on the passions of the people, that the conspirators were compelled to escape from Rome, leaving the successful orator for a while in possession of almost absolute power. Next, we find A. occupied in disputes and reconciliations with Octavianus (Cæsar's heir), besieging Mutina, and then denounced by Cicero as an enemy of the state. In 43 B.C., his troops were defeated at the battle of Mutina, when he escaped beyond the Alps; visited the camp of Lepidus, who commanded in Gaul; and gained the favor of the army, of which he took the command. Plancus and Pollio joined him with their troops; and A., who so recently had escaped as a helpless fugitive from Italy, returned to Rome at the head of seventeen legions and 10,000 cavalry. Octavianus, who had pretended to maintain republican principles, now threw off the mask, and held a consultation with A. and Lepidus on the island of Reno (or Lavino), near Bologna, when it was determined that these triumviri should share the whole Roman world among themselves. To secure their spoil, they returned to Rome, and began their course of murder and robbery throughout Italy. Among their first victims fell Cicero, the orator whose eloquence they dreaded.

According to Appian, not less than 300 senators and 2000 knights fell under the power of the triumviri. After making Italy safe for themselves, and raising an enormous sum of money to carry on their war abroad, A. and Octavianus led their troops into Macedonia against Brutus and Cassius, and defeated the republican forces. A. next paid a visit to Athens, and went into Asia, to arrange his dispute with Cleopatra, queen of Egypt, whose conduct had offended the triumviri. The queen herself appeared to answer his challenge, and captivated A. by her beauty and address. The general who had overcome Brutus and Cassius was now made a prisoner, but not of war. He followed Cleopatra into Egypt, and lived with her in idleness and luxury, until he was aroused by tidings of the quarrel which had taken place in Italy between his own relatives and Octavianus. This dispute gave rise to a short war, which came to an end before A. arrived in Italy. A new division of the Roman world now took place between the triumviri, and was soon quietly arranged at Brundusium. A. took the East, and Octavianus took the West; while the ambition of the feeble Lepidus was appeased by having the whole of Africa for his portion. Even this shadow of dominion was taken from him in 36 B.C. Meanwhile A. had confirmed his friendship with Octavianus by a marriage with Octavia, his sister. He now returned to Cleopatra, resumed his former voluptuous mode of life, squandered the wealth of Rome in gifts to his royal mistress, and became guilty of gross acts of injustice. Octavianus made use of these facts to excite the indignation of the Roman people against A., and a war between the rivals became unavoidable. A., in his idleness, tried to postpone the trial of strength which he saw inevitably approaching, and filled the island of Samos (where his troops were quartered) with musicians, jugglers, and buffoons. Meanwhile, at Rome, he was deposed from the triumvirate, and war was proclaimed against Cleopatra. Each party collected its forces, and in the naval engagement which took place (31 B.C), near Actium (q. v.), A. was defeated. His subsequent hope of finding troops still faithful to him in Libya was disappointed. He returned to Egypt, where, with Cleopatra, he once more forgot political cares and vexations, until his amusements were suddenly interrupted by the arrival of Octavianus at Alexandria. A. now roused himself, made a charge with his cavalry, and repelled the enemy; but the advantage was only momentary. Deserted by the Egyptian fleet, as by his own army, and suspecting that even Cleopatra had conspired against him, he went to her palace, from which the queen had escaped. Deceived by a false message informing him of the death of Cleopatra, A. committed suicide by falling upon his sword, in the year 30 B.C.

ANTO'NIUS or A'NTONY OF PADUA, SAINT, was born at Lisbon, August 15, 1195, and, on the father's side, was related to Godfrey of Bouillon. He was first a monk of the Augustine order, and in 1221 became one of the most active propagators of the order of Franciscans. On his missionary voyage to Africa, being cast on the coast of Italy, he preached with great success at Montpelier, Toulouse, Bologna, and Padua, where he died, June 13, 1231. The legends of A. of P. are full of absurd fables. Among others, we are told that his eloquence as a preacher was so great that even the fish in the sea were deeply affected by it! His anniversary falls on June 13. His monument, a fine work of statuary, is in the church which bears his name at Padua.

ANTONY, SAINT, surnamed THE GREAT, and also ANTONY OF THEBES, the father of monachism, was born about the year 251 A.D., at Koma, near Heraklea, in Upper Egypt. His parents were both wealthy and pious, and bestowed on him a religious education. Having, in obedience to what he believed to be a divine injunction, sold his possessions, and distributed the proceeds among the poor, he withdrew into the wilderness, where he disciplined himself in all those austerities which have hallowed his memory in the Catholic Church, and formed the model of the monastic life. When 30 years of age, however, desirous of obtaining a deeper repose than his situation afforded, he penetrated further into the desert, and took up his abode in an old ruin on the top of a hill, where he spent twenty years in the most rigorous seclusion; but, in 305, he was persuaded to leave this retreat by the prayers of numerous anchorites, who wished to live under his direction. He now founded the monastery of Faïoum, which at first was only a group of separate and scattered cells near Memphis and Arsinoë, but which, nevertheless, may be considered the origin of cenobite life. The persecution of the Christians by Maximian in 311 A.D., induced St. A. to leave his cell, and proceed to Alexandria, in the hope of obtaining the crown of martyrdom; but having failed in this, he returned to his solitude in the course of a year, which, however, he soon left, and plunged yet deeper into the desert. At length he found a lodgment on a hill, about a day's journey from the Red Sea; but his disciples discovering his retreat, so pressed him with their affectionate importunities, that he ventured to accompany them back. After many pious exhortations, he once more left them, and soon became the mighty oracle of the whole valley of the Nile. In 355, the venerable hermit, then 104 years of age, made a journey to Alexandria to dispute with the Arians. He had interviews with Athanasius and other distinguished persons; but feeling his end approaching, he retired to his desert home, where he died, 356 A.D.

Athanasius states, in his Life of St. A., that the saint wore only a coarse shirt of hair, and never washed his body, which is more credible than the stories he relates of his encounters with the devil, or his miracles. His whole conduct indicates the predominance of a glowing and yet gloomy fancy, which is the proper condition of religious asceticism. Although the father of monachism, St. A. is not the author of any monastic 'rules;' those which the monks of the eastern schismatic sects attribute to him are the production of St. Basil. He is perhaps the most popular saint in the Catholic Church. Accounts of his life and miracles are given in the *Acta Sanctorum* of the Bollandists, under the date of the 17th January, on which day his festival was kept.

ST. ANTHONY'S FIRE.—The Rev. Alban Butler, in his *Lives of the Saints*, gives the following account of the origin of this name: 'In 1089, a pestilential erysipelatous distemper, called the *sacred fire*, swept off great numbers in most provinces of France; public prayers and processions were ordered against this scourge. At length, it pleased God to grant many miraculous cures of this dreadful distemper, to those who implored His mercy through the intercession of St. A., especially before his relics; the church [of La Motte St. Didier, near Vienne, in Dauphiné] in which they were deposited was resorted to by great numbers of pilgrims, and his patronage was implored over the whole kingdom against this disease.' The 'order of Canons Regular of St. Anthony,' a religious fraternity, founded about 1090, for the relief of persons afflicted with the fire of St. A., survived in France till 1790.

ST. ANTHONY'S WELL, a small fountain near the ruined chapel of St. A., on the northern slope of Arthur's Seat (q. v.), near Edinburgh. This interesting fountain, which consists only of a stone basin, into which water trickles from under an incumbent rock, is celebrated in the Scottish song—

'*O, waly, waly.*'

ANTRAI'GUES, EMANUEL-LOUIS-HENRI DELAUNAY, COUNT OF, a great politican, but very ambiguous character, was born at Vivarais, in the department Ardèche, in 1765, and was educated

under the Abbé Maury. His superior talents were first displayed in his *Mémoire sur les Etats-généraux, leurs Droits et la Manière de les convoquer* (1788). This book, full of daring assertions of liberty, was one of the first sparks of the fire which afterwards rose to such height in the French Revolution. In 1789, when A. was chosen as a deputy, he not only defended the privileges of the hereditary aristocracy, but also ranked himself with those who opposed the union of the three estates; while in the discussions on the constitution, he maintained that the royal *veto* was an indispensable part of good government. After leaving the Assembly in 1790, he was employed in diplomacy at St. Petersburg and Vienna, where he defended the cause of the Bourbons. In 1803 he was employed under Alexander of Russia in an embassy to Dresden, where he wrote against Bonaparte a brochure, entitled *A Fragment of the 18th Book of Polybius, discovered on Mount Athos.* He afterwards came to England, and acquired great influence with Canning. Despite his attachment to the interest of the Bourbons, he could never win the confidence of Louis XVIII. In 1812 he was murdered, with his wife, at his residence near London, by an Italian servant, who, immediately after the act, committed suicide.

A'NTRIM, a maritime county in the north-east of Ireland, in the province of Ulster; bounded, N., by the Atlantic; W., by the north part of the river Bann, dividing it from Londonderry, and by Lough Neagh; S., by Lagan river, separating it from the county of Down; S. E., by Belfast Lough; and E. by the Irish Channel. It stands third among the Irish counties in population, but in extent only ninth. Its greatest length is 56 miles; its greatest breadth, 30; its extent of sea-coast, 90 miles. Area, 1164 square miles. About two-thirds of this is arable; a fourth, barren; and a seventy-fourth in woods. Pop. (1851) 352,264; (1861) 368,948; (1871) 404,015; (1881) 421,943, of whom near 190,000 were Presbyterians, 108,000 Roman Catholics, and 98,000 Protestant Episcopalians. Off the north coast lie Rathlin Isle and the Skerries; and off the east coast, the Maiden Rocks. The east coast is hilly; and from Larne to Fair Head, parallel mountain-ranges of no great height, and covering a third of the county, stretch S. W. into the interior, forming valleys opening seaward, called the Glens of Antrim. The interior slopes towards Lough Neagh. The highest eminences are—Trostan, 1810 feet; and Slievemish, or Slemish, 1782 feet. The principal streams are—the Bann, from Lough Neagh to the Atlantic; the Main, running parallel to the Bann, but in the reverse direction, into Lough Neagh; and the Bush, flowing north into the Atlantic. Many peat-bogs occur in the county. Six-sevenths of the surface consists of basaltic trap, often alternating with red ochre, and overlying hardened chalk, green-sand, new red sandstone, and mica-slate.

The surface and edges of the trap-field, in some places, present basaltic columns of varied outlines. The green-sand and new red sandstone crop out of the E. and S.-E. borders, and millstone grit occurs in the N.-E. Between Ballycastle and the mouth of the Bann, the basalt assumes very picturesque forms; and the Giants' Causeway, is one of the most perfect examples of columnar basalt in the world. Fine salt mines occur at Dunerue and Carrickfergus; and small coal-fields near Ballycastle and the interior. Rich beds of iron ore of fine quality have been recently opened in Glenravel, and a large export has been carried on from Cushendall and Carnlough. The soil of A. is mostly light, and the chief crop is oats. In 1878, 246,498 acres were under crop, 81,760 being in oats, 45,831 in potatoes, and 5372 in wheat. The land is very much sub-divided; and the rearing of flax, and the various branches, of the linen, cotton, and coarse woollen manufacture employ a great portion of the people. In 1881, there were upwards of 95,000 pupils on the rolls of the National Schools in the county (23,000 being Catholics). The principal towns are—Belfast, Lisburn, Ballymena, Ballymoney, Carrickfergus, Larne, and Antrim. A. county returns two members to parliament; Belfast borough, two; and Carrickfergus and Lisburn boroughs, each one. The inhabitants are mostly Presbyterians, the county having been extensively colonized from England and Scotland. The original possessors were the O'Neills, who, partially dispossessed by John de Courey, reappeared as chief, on the failure of his line, and in 1533, regained the whole country, except Carrickfergus and part of the Glens—held by the Bissets of Glenarm. The forfeiture of Shane O'Neill terminated the dominion of his race.

A'NTWERP (in French, ANVERS), the capital of the province which bears its name, and the chief commercial city of Belgium, is situated on the river Scheldt. Pop. (1880) 169,112. Its chief public institutions are—the Academy of Sciences, Academy of Painting and Sculpture, formerly known as the Academy of St. Mark, a Medical and Surgical School, Naval Arsenal, Museum, and Zoological Gardens. The cathedral, one of the noblest Gothic structures in Europe, is 500 feet in length by 240 in breath, with a roof supported by 125 pillars, and a very lofty spire. The interior is enriched by the two greatest of all the pictures of Rubens, the Elevation of, and the Descent from the Cross. The Church of St. James contains the monument of the Rubens family. The new fortifications, recently erected, render the commercial capital of Belgium one of the most strongly fortified places in Europe. The trade and manufactures of A. have recently greatly extended, and the large dock and quay accommodation having been found too limited, steps have been taken for making a new quarter of the town, with ample harbor-room, on the opposite side of the Scheldt. The manufactures consist chiefly of sugar, white-lead, cotton goods, point-lace, linen-thread, carpets, gold and silver lace. It is still celebrated for its sewing-silk, black silk stuffs, and printer's ink, as it was in former times for its velvets, damasks, and satins. There are also to be mentioned tobacco-manufacture, the cutting of diamonds and other precious stones, and shipbuilding.

A. is mentioned as early as the 8th c.; in the 12th and 13th it gave signs of considerable prosperity, and in 1550 numbered more than 200,000 inhabitants. The union of Belgium with Holland in 1815 was very favorable to the commerce and general prosperity of A. By the revolution of August 1830, it was linked to the destiny of Belgium. When the revolutionary party gained possession, the commandant, General Chassé, retreated to the citadel, and, exasperated by the breach of truce, commenced a bombardment, which destroyed the arsenal and about thirty houses. In 1832, a French army of 50,000 men, under Marshal Gérard, appeared before A., to demand the surrender of the citadel, which General Chassé refused. After the interior of the citadel had been reduced to ruins by the French artillery, General Chassé capitulated; the Flemish fortification, and the forts Burght, Zwindrecht, and Austroweel, were surrendered to the Belgian troops, and the Dutch troops were taken to France, as hostages for the surrender of the forts Lillo and Liefkenshoek, according to an article in the negotiation of Nov. 15, 1831, which stipulated that the five citadels held by the Dutch troops in Belgium should be surrendered.

ANU'BIS, an Egyptian deity, styled Anepu on hieroglyphic monuments, was, according to mythology, the son of Osiris and Nephthys. By the Greeks, he was frequently styled Hermes or Hermanubis, combining the Egyptian with the Grecian name. He is represented on monuments as having the head of a jackal, with pointed ears and snout, which the Greeks frequently changed to those of a dog. Sometimes he is seen wearing a double crown. A white and yellow cock was sacrificed to him. His office, like that of Hermes Psychopompus among the Greeks, was to accompany the ghosts of the deceased into Hades (Amenthes), and there to assist Horus in weighing their actions, under the inspection of Osiris. As, in the time of the Romans, the Egyptian worship had spread beyond Egypt itself, the two conceptions of A. and Hermes were blent together, and the dog's head of the former was found united to the insignia of the latter.

Anubis.

ANUPSHUHU'R, a town of India, in the British district of Bolundshuhur, North-west Provinces, on the right bank of the Ganges, 73 miles east from Delhi, on the route to Bareilly. The channel of the Ganges is here about a mile wide, but only about one-fifth of that space is occupied by the stream in the dry season. The town is ill built and crowded, the houses either of mud or ill-cemented brick. Pop. (1871) 10,644.

A'NUS, The, and its Diseases. The term *anus* is applied by anatomists to the lower or (in the case of animals) the posterior aperture of the intestinal canal; the rectum terminating externally in the anus. With regard to its anatomy, it is sufficient to state that it is kept firmly closed on ordinary occasions by the *external* and *internal sphincter* muscles, the former of which contracts the integument around the opening, and, by its attachment to the coccyx behind, and to a tendinous center in front, helps the *levator ani* muscle in supporting the aperture during the expulsive efforts that are made in the passage of the fæces or intestinal evacuations; while the latter or *internal sphincter*, is an aggregation of the circular muscular fibres of the lowest part of the rectum, and acts in contracting the extremity of the tube. The main function of the *levator ani* muscle is expressed in its name, it being the antagonist of the diaphragm and other muscles which act in the expulsion of the fæces. The integument around the anus lies in radiating plaits, which allow of its stretching without pain during the passage of the fæces; and the margin is provided with a number of sebaceous glands, which, in some of the lower animals, secrete strongly odorous matters. See Anal Glands. Infants are occasionally born with an imperforate *anus*, or congenital closure of the rectum. In the simplest form of this affection, the anus is merely closed by thin skin, which soon becomes distended with the Meconium (q. v.). More complicated cases are those (1) in which the gut terminates some distance above the seat of the anus in a blind sac or pouch; (2) where the rectum termi-

nates in the bladder, &c. Fortunately, the closure by a layer of skin is far the most common form of imperforate anus, and the little patient is at once relieved by a very simple surgical operation. If, however, no treatment be adopted, which is too often the case, in consequence of a popular delusion that the affection is incurable, the abdomen becomes distended and hard, vomiting comes on, the vomited matters soon assume a fæcal smell, and the infant dies in a few days, either from exhaustion or rupture of the intestines.

Spasm of the Sphincter Ani is by no means a rare affection; it is characterized by violent pain of the anus, with difficulty in passing the faeces. On attempting an examination, the muscle feels hard, and resists the introduction of the finger. It usually occurs in sudden paroxysms, which soon go off; but sometimes it is of a more persistent character. Its causes are not clearly known, and although most surgeons regard it as a special affection, some consider that the spasm is not a disease in itself, but merely a symptom of some slight excoriation or ulceration.

Suppositories containing opium or belladonna introduced during the period of relaxation, are sometimes of use; and if there are ulcers, they must be specially treated. *Ulceration* occurring as a breach of surface at one or more points around the anus, but not extending within the orifice, is by no means uncommon in persons who are not attentive to cleanliness, and especially in women with vaginal discharges. Strict attention to cleanliness, the patient being directed to apply warm water to the parts at least twice daily with a sponge (which after each operation should be carefully rinsed out), and one or two applications of the solid nitrate of silver, followed by black-wash, will effect a speedy cure. If the ulcer is seated partly *without* the anus and partly *within* the rectum, the distress is much more severe, and the treatment often requires the use of a knife. *Fissure of the anus* is a term applied to an affection consisting in one or more cracks, excoriations, or superficial ulcerations, situated between the folds of the skin and mucous membrane at the verge of the anus, and only slightly involving the rectum. They give rise to intense pain during the passage of the evacuations, and for some hours afterwards to great discomfort, smarting, and itching. The treatment to be adopted is to endeavor to procure regular and somewhat soft evacuations, and to sponge with warm water immediately afterwards, the parts being dried with a soft cloth. One or two applications of solid nitrate of silver will sometimes cure the disease; and an ointment of oxide of zinc, or one containing chloroform, will sometimes serve to allay the irritation and heal the parts.—*Pruritus ani*, which simply means intense itching and irritation of this part, is perhaps rather to be regarged as a symptom of certain morbid changes rather than as a special disorder; but as it is a very common affection, and is productive of much suffering it must not be passed over. It is often associated with an unhealthy state of the intestinal secretions, or with simple constipation; with a congested state of the mucous membrane; with a disordered condition of the womb; with the presence of thread-worms in the rectum, &c.; and it is peculiarly common in persons whose occupations are sedentary. The affection is often much aggravated by the patient's being unable to refrain from scratching the parts, which leads to excoriations, ulcerations, thickening of the skin, &c. The symptoms are usually most severe when the sufferer begins to get warm in bed. If the affection arise from worms, or a loaded state of the large intestines, enemata and purgatives will give immediate relief. If unhealthy excretions exist, attention must be paid to the diet, and the occasional administration of a pill containing a grain of calomel and four grains of watery extract of aloes, together with the local application of soap and water to the parts, will often stop the itching. If there are any cracks or ulcers, nitrate of silver must be applied until they heal. To prevent the reappearance of these sores, the patient should bathe the parts night and morning with a strong solution of alum. An ointment composed of a drachm of calomel and an ounce of lard is strongly recommended by Mr. Smith of King's College Hospital, when other means have failed; who also states that the daily introduction of a well-oiled bougie, made of black wax, will sometimes succeed in very obstinate cases. The other principal affections of the anus are *Fistula*, *Piles*, and *Prolapsus*, which are discussed in special articles.

ANVILLE, Jean Baptiste Bourguignon d', a celebrated French geographer, born at Paris in 1697, died in 1782. He devoted his whole life to geographical science. Such was his natural taste for map-drawing, that his first study of the ancient authors induced him to publish, at the age of fifteen, a map of Greece. His rare qualities gained him the friendship of the Abbé de Songuerue, from whom he received those instructions which were the source of that profound and extensive knowledge he subsequently acquired. He read the Greek and Latin historians and philosophers, as well as poets, specially noting the names and positions of cities and nations. He advanced the science of geography, not only by the vast number of maps which he executed, but also by the treatises, full of erudition and of historic and critical details, in which he discussed numerous interesting questions. The works of A. announced by M. de Maine many years ago, were to have been contained in six volumes, exclusive of the volumes of maps. The principal portion was published in 1834 by Levrault. But the death of M. de Maine in 1832 stopped the quarto edition near the end of the twelfth volume, to which the map of Africa was however wanting, although the text had been added, with notes digested from the most recent investigations in that country. A. has left 211 maps and plans, and 78 memoirs, the most of which are inserted in the *Recueil des Mémoires de l'Académie des Inscriptions et Belles-lettres*. His best map is that of Ancient Egypt. His *Orbis Veteribus Notus* and *Orbis Romanus*, are also invaluable. The same remark applies to his maps of Gaul, Italy, and Greece, both ancient and medieval. His maps of modern countries contain all the knowledge attained in his time. His valuable collection of maps was purchased in 1779 by the French government for the Royal Library.

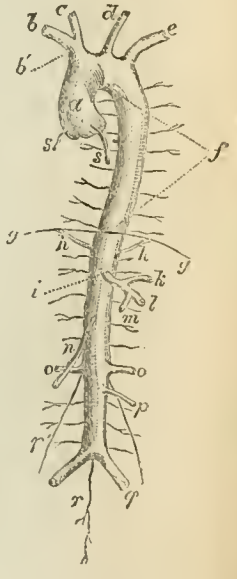
ANWARI, a celebrated Persian poet, who flourished during the 12th c., was born in the province of Khorassan, and educated at the college of Mansur, at Tus. He emerged from obscurity in the course of a night. The story goes that the Seljukide sultan, Sanjar, happened on one occasion to visit Tus, when the imagination of the youthful poet was so excited by the presence of the monarch and his glittering retinue, that he resolved to write a poem in his praise. By next morning, it was finished, and presented to Sanjar, who instantly placed the fortunate youth among his courtiers. A. now began to devote himself to astrology, which was his ruin; for having predicted that in 1185 or 1186 A.D. a hurricane would burst over all Asia, overthrow the most solid edifices, and shake the very mountains, and nothing of the sort really occurring, but, on the contrary, an entire year of remarkably tranquil weather, he fell into disgrace, and had to retire to Balkh, where he died in 1200—1201 A.D.

His poems consist chiefly of lengthy panegyrics, and shorter lyrical effusions. The latter (*ghazels*) are characterized by simplicity, ease, and naturalness; but the *kasidas*, or long poems, are disfigured, like many other eastern poems, by glittering imagery and historical conceits. His *Elegy on the Captivity of Sanjar taken Prisoner by the Ghurides*, has been translated into English by Captain Kirkpatrick in the 1st volume of *Asiatic Miscellanies* (Calcutta, 1785).

AONLAGA'NJ, or AOUNLAH, a town of India, in the British district of Bareilly, 21 miles south-west from Bareilly, on the route to Allygurh. It has a large bazaar. Pop. (1871) 9947.

A'ORIST, a form of the Greek verb by which an action is expressed as taking place in an indefinite (Gr. *aoristos*) time. The Greek language is especially fertile in the past tenses of verbs, having, in addition to the tenses common to other languages—namely, the imperfect, perfect, and pluperfect—the A., which is peculiarly adapted to the narrative style of writing. The distinction of first and second A. is purely formal.

AO'RTA is the great arterial trunk which, rising from the left ventricle of the heart, sends its branches ramifying through the whole body. The A. in man is subdivided by anatomists into the Arch, the Thoracic A., and the Abdominal A. The *arch* is a loop with the convexity directed upwards, forwards, and to the right side, reaching at its highest part to a level with the second piece of the breast-bone, and then descending to the left side of the third dorsal vertebra. Five arteries arise from the arch—viz., two coronaries, for the supply of the muscular tissue of the heart itself; the innominata; and the left carotid and left subclavian arteries. At the commencement of the arch are three small swellings or pouches, the aortic sinuses, below which are the three semilunar valves or folds of the lining membrane, which prevent regurgitation of the blood back into the heart. The *thoracic A.* extends from the third dorsal vertebra to the diaphragm, gradually getting into the middle line of the spine. The thoracic A. gives off the bronchial arteries (two or three) to supply the tissue of the lungs; and some small branches (three or four) to the œsophagus, and intercostal arteries, to supply the walls of the chest (ten on left, and nine on right side). The *abdominal A.* passes from the diaphragm to the fourth lumbar vertebra, opposite the



Aorta:

a, ascending arch of aorta; *ee*, coronary arteries; *b'*, innominata artery; *b*, right subclavian; *c*, right carotid; *d*, left carotid; *e*, left subclavian; *f*, thoracic aorta; *gg*, diaphragm; *hh*, phrenic arteries; *i*, cœliac axis; *k*, coronary or gastric; *l*, splenic; *m*, hepatic; *n*, superior mesenteric; *oo*, renal arteries; *p*, inferior mesenteric; *p'*, spermatic; *q*, common iliac; *r*, middle sacral.

lower margin of which it divides into the two common iliac trunks. The abdominal A. gives off the two phrenic arteries to the diaphragm; the cœliac axis, which divides into three large branches for the stomach, liver, and spleen; the superior mesenteric for the small, and part of the large intestine; the *renals* (two); the *suprarenals* (two), one for each kidney; the spermatic; the inferior mesenterie, for the part of the large intestine not supplied by the superior mesenteric; and four or five lumbar arteries, which supply the lower part of the abdominal walls (the loins).

Where the A. bifurcates, a small artery, the *sacramedia*, or *caudal* artery, arises, and passes along in the middle line; in fish and in animals with large tails, this branch is a continuation of the A.

The above is the usual arrangement; but occasionally it varies, especially in the number of arteries springing from the arch. The structure of the A. will be given under ARTERY; and the comparative anatomy under HEART and CIRCULATION.

During fœtal life, there is a communication between the arch of the A. and the pulmonary artery called the *ductus arteriosus*, the canal of which becomes obliterated after birth. It has been calculated that the velocity of the blood in the ascending part of the arch is 2½ inches in a second. The pressure of the blood in the A. of a horse has been estimated to be 11 pounds; and in man's, 4 pounds 6 ounces.

The coats of the A. are very subject to fatty disease termed Atheronia (q. v.), and in advanced life, to calcareous degeneration or deposit of earthy particles, which destroys their elasticity. This change renders them very liable to Aneurism (q. v.), which as may be expected, is generally situated at the curves of the A., especially at the arch. Sufferers from this disease in the arch or thoracic A., suffer from palpitation within the chest, difficulty of breathing, occurring in paroxysms and during sleep, and shoots of pain through the chest. If the aneurism is on the arch, it generally presses forward, and may completely destroy the breast-bone, forming a pulsating-tumor, covered only by the skin, or it may press up into the neck. If low in the chest, the aneurism may compress the thoracic duct, and cause emaciation. In the abdomen, the symptoms are pulsation and pain; but in both situations aneurism may exist for a length of time without attracting attention.

In some cases, the A. has been found obliterated, showing that the lower extremities can be supplied with blood by the anastomosing branches. Sir Astley Cooper and other surgeons have tied the A. for aneurism, but without success.

AOSTA, a district of the province of Turin, in North Italy, surrounded by the highest elevations of the Alps, and watered by the river Dora-baltea. It contains an area of 1233 square miles. The dense pine-woods on the hills, the alpine pastures on the slopes, the plantations of vines, almonds, olives, figs, and mulberry trees in the valleys, and the ores of silver, copper, and iron in the bosom of the mountains, supply occupation and means of subsistence to a population of about 83,000; but the land generally is not adapted to the growth of corn, though maize, barley, oats, &c., are produced in the lowest portions of the valleys. The disease styled Cretinism (q. v.) prevails to a lamentable extent, and few persons are altogether free from Goitre (q. v.). Great numbers of the poorer class emigrate during winter into the richer countries in their vicinity, and earn a livelihood as chimney-sweepers, masons, and smiths.—AOSTA, the principal town, 49 miles N.N.W. of Turin, contains 6700 inhabitants, and has a large trade in cheese, hemp, leather, &c. It was in ancient times the chief residence of the Salassi, a brave race of mountaineers, with whom Appius Claudius (134 B.C.) had to contend on his way into Gaul. They were finally destroyed by Terentius Varro in the time of Augustus. Monuments of the Roman times—a well-preserved arch, two gateways, the ruins of an amphitheater, and a bridge—still remain. The celebrated baths and mines of St. Didier are in the neighborhood. St. Bernard, the founder of the famous hospice which bears his name, was Archdeacon of A.; and Anselm, Archbishop of Canterbury, was born here.

APA'FI, MICHAEL I., Prince of Transylvania, was born in 1632, of an old but decayed family. He accompanied Prince George II. in an expedition against the Poles in 1656, but was taken prisoner at the irruption of the Tatar hordes under their khan, Mohammed Girai. After his release, he went and lived for a short time at his paternal estate; but in 1661 he was chosen Prince of Transylvania, at the instigation or desire of Ali Pasha, generalissimo of the Turkish forces under Sultan Mahmoud IV. During the peace concluded with Austria, he reigned peaceably under the protection of the Porte, and acquired the towns of Clausenburg and Zathmar. He remained faithful to the Ottoman power till the siege of Vienna in 1683. Fortune then changed. The imperial troops penetrated into the country; and on the 12th of August 1687, A. made a treaty with the emperor at Harkany, by which Transylvania was declared to be freed 'for ever' from Turkish suzerainty, and placed under German protection. At Fogaras, on the 1st of July 1688, the Transylvanian deputies assembled at the national Diet, took the oath of fealty to the Hapsburgs as legitimate monarchs of Hungary. Ever since the death of his wife, Anna Bornemitza, in 1688, A. had been sorely afflicted both in body and mind, and died (April 15, 1690) on the eve of a fierce retributive war, commenced by his old allies the Turks, who considered themselves ill used by his desertion of them. His son, Michael II., succeeded to the throne and its perils.

The Turks, under the vizier Cuprigli, overthrew the imperial army, and took several places, such as Nissa, Widdin, Semendria, Belgrade, &c.; but the intestine troubles of the Ottoman empire hindered them, or rather Count Tekeli, the adventurer whom they were helping, from retaining these towns. The imperial troops subsequently regained everything; and at length the young Transylvanian prince was inveigled to Vienna, and cajoled into giving up his dominions to Austria in lieu of a pension of 12,000 or 15,000 florins. He died in 1713.

A'PANAGE is not an English legal term, but is a technical word in the French law, in which system it signifies the assignment or conveyance by the crown of lands and feudal rights to the princes of the royal family, that they may be enabled to maintain themselves according to their rank. (See a long article on this subject in Knight's *Political Dictionary*, which refers to Rotteck and Welcker, *Staats-Lexicon*, art. by P. A. Pfizer. See also Merlin's *Répertoire de Jurisprudence* under this head.) The word A., however, is sometimes found in Scotch law-books, the Scotch lawyers having most probably derived it from France, whose system of laws was so largely imported into Scotland—the Court of Session itself having been modelled after the plan of the Parliament of Paris. Mr. Erskine, in his *Principles of the Law of Scotland*, book i., tit. 4, sec. 8, says: 'The A., or patrimony of the Prince of Scotland, has been long erected into a regality jurisdiction, called the principality. It is personal to the king's eldest son, upon whose death or succession it returns to the crown. The prince has, or may have, his own chancery, from which his writs issue, and may have his own chamberlain and other officers, for receiving and managing his revenue;' and the late Professor Bell, in his *Principles of the Scotch Law*, calls this principality the prince's 'perpetual A. and personal provision.' In England, the duchy of Cornwall may be said to be an A. of the Prince of Wales, in whose person, also, since the junction of the two kingdoms under the same crown, now merge the rights of the Prince of Scotland. His royal highness, in fact, when he goes north, ought strictly to be called, not Prince of Wales, but Prince of Scotland.

In common parlance in England the word A. is loosely used to denote any extra-territorial jurisdiction or sovereignty by governments or states; and even any dignity or right enjoyed by persons of rank.

APATHI'N, a town of Hungary, in the county of Bacs, near the left bank of the Danube, 49 miles south-west from Theresiopol. It has manufactures of woollen cloth, and a considerable trade in hemp, silk, madder, and woad, the products of the vicinity. Pop. (1869) 11,047.

A'PATITE is the scientific and commercial name applied to a mineral mainly consisting of phosphate of lime (bone-earth), and which for some years past has been largely used in the preparation of manures. It is employed for the same purpose as bones or bone-ash—namely, to supply phosphoric acid to the soil. The massive radiated variety is sometimes called *phosphorite*, and when massive, earthy, and impure, it is also known as *osteolite*. Coprolites (q. v.), or phosphatic nodules, are likewise mainly composed of phosphate of lime. A. is found as a bedded rock, in compact spheroidal masses, in veins and dykes, and as an accessory constituent of rocks. It exists in nearly all geological formations, but is perhaps most abundant in the older metamorphic rocks. Extensive deposits of A. occur in various parts of the world. From Krageröe in Norway, where it occurs associated with granitic rocks, and from Estremadura in Spain, where it is found in cretaceous strata, it has been largely sent to England, the total imports of these mineral phosphates having in some years reached 5000 tons. There is a bed of A., 18 inches thick, of Silurian age, at Llanfyllin in North Wales which has been extensively worked. A remarkable deposit of a kind of A., or rather rock guano, which has been termed 'Sombrerite,' was discovered some years ago in the small island of Sombrero, situated about 60 miles to the east of St. Thomas, in the West Indian group. It covers a great part of the island, which is about 1½ miles long, by ⅔ths of a mile in breadth. Mr. A. A. Julien, writing from the spot in 1864, says there 'is a natural division of the Sombrero Guano into two varieties. One of an oolitic structure, of a great variety of colors, and containing, in addition to the bone ($3CaO,PO_5$) and neutral ($2CaO,PO_5$) phosphates of lime, the phosphates of alumina, iron, and magnesia, &c. The other variety, generally of a broad concretionary structure, is of a white or yellowish-white color, containing a little carbonate of lime, sulphate of lime, &c., but especially abounds in bone phosphate of lime. It is almost certain that the former more nearly resembles the original deposit, and is the older of the two; while the latter

is far more uniform in composition. The guano is interlaminated with ordinary coral limestone.' It is now believed that this hard or rock guano has been formed by water filtering through ordinary guano, into the coral rock adjoining, and turning it more or less completely into phosphate of lime. A similar hard guano occurs at Monk's Island, and one or two others in the Caribbean Sea. Large quantities have been introduced into this country, and still more into the United States, under the name of Sombrero Guano, and are extensively employed by the manufacturers of artificial manures, in place of ordinary bone-ash. The general treatment to which mineral phosphate is subjected, is to reduce it to powder, and act upon the pulverized matter with sulphuric acid, which renders the phosphoric acid in the A. soluble in water, and thereby facilitates its introduction into the plant.

These substances require to be ground to a finer powder, and subjected to a more protracted digestion than bones. In the greater number of cases where the A. or Sombrero Guano is treated in this way, it is mixed with other manures, such as Peruvian Guano, blood, or true bones, and thus a complex substance is manufactured, which is much more acceptable to the plant than the simple A. or *mineral phosphate* itself. The great importance of mineral phosphate, in an agricultural point of view, arises from the fact that no mineral substance possesses more influence over the growth of the edible plants, such as wheat, barley, oats, turnips, &c., than phosphoric acid does; any cheap source of that substance, therefore, is a great boon. The island of Sombrero contains as much phosphatic or bony matter as is present in many millions of oxen, and represents as much manure as would be obtained by the employment of the bones of these cattle. The different varieties of A. contain a little fluoride or chloride of calcium, or both, as well as phosphate of lime. Of these varieties, besides those already mentioned, there are others, as *Moroxite*, *Francolite*, and *Asparagus Stone*. It occurs both massive and in crystals—which are generally small, and are often six-sided prisms, or six-sided tables, but some very large ones have been brought from Canada. It occurs in some of the tin mines in Cornwall, Saxony, Bohemia, &c., and in rocks of various ages, as mentioned above. It is found of various colors, more or less green, blue or red, sometimes white, and often gray. The proposal to employ it as a manure first excited much interest in 1856, and began to be enterprisingly carried into effect, with happy results—rocks once deemed most barren being thus rendered conducive to the fertility of soils. In Spain, A. is used as a building stone.

APE, a name commonly given to the tailless monkeys. (See BARBARY APE, CHIMPANZEE, GIBBON, GORILLA, ORANG-OTANG, &c.) It was originally commensurate in signification with monkey, and the terms were indiscriminately used. The origin of the word is uncertain. See MONKEY.

The worship of apes or monkeys has been common among pagan nations from a period of remote antiquity, and still prevails very extensively, being practised in Japan, in India, and by some of the African tribes. The source of it is perhaps to be found partly in the doctrine of the transmigration of souls, and partly in the qualities which apes have been supposed to possess in a conspicuous degree, and of which they have been made symbolic. An A.'s tooth, kept in a temple in Ceylon, was regarded with extraordinary veneration, and immense wealth was accumulated through the continual offerings of the worshippers; but the temple was plundered, and the tooth carried away by the Portuguese in 1554.

A-PEAK, or A-PEEK, a maritime term signifying the position of an anchor when the cable has been drawn so tight as to bring the ship directly over it; the sailors then say that 'the anchor is a-peak.'

A'PELDORN, a beautiful village in the Netherlands province of Gelderland, is situated about 17 miles north from Arnhem, on a canal which joins the river Grift, a branch of the Yssel, by which, and the public roads from Arnhem and Utrecht to Deventer and Zutphen, and by railway, it has much traffic. The Loo, a hunting-lodge of the king, is in the neighborhood. The principal industries are agriculture, making paper, grinding corn, founding copper, manufacturing blankets and coarse woollen cloth, &c. Pop. of A., (1879) 15,053.

APE'LLES, the most celebrated painter in ancient times, was the son of Pythias, and was probably, in accordance with the statement of Suidas, born at Colophon, on the Ionian coast of Asia Minor; though Pliny and Ovid call him a Coan, and Strabo and Lucian an Ephesian. This, however, may simply refer to the fact that he was made a burgess of that town. He flourished in the latter part of the 4th c. B.C., received his first instruction in art in the Ionian school of Ephesus, then studied under Pamphilus of Amphipolis, and latterly at Sicyon, under Melanthius, and thus he united the fine coloring of the Ionian with the accurate drawing of the Sicyonic school. During the time of Philip, A. visited Macedon, where he became the intimate friend of Alexander the Great. It was probably at the Macedonian court that the best days of A. were spent. Pliny relates that on one occasion when Alexander visited A. in his studio, the king exhibited such ignorance of art, that A. recommended him to be silent, as the boys who were grinding the colors were laughing at him. But the same story is told of Zeuxis and Megabyzus. He afterwards visited Rhodes (where he was familiar with Protogenes), Cos, Alexandria, and Ephesus. The period of his death is not known; but as he practised his art before the death of Philip, and as his visit to Alexandria was after the assumption of the regal title by Ptolemy, he probably flourished between 352 and 308 B.C. The most celebrated paintings of A. were his Anadyomene, or Venus Rising from the Sea, with a shower of silver drops falling round her like a veil of gauze, the Graces, and similar subjects; but he cultivated the heroic as well as the graceful style. His ideal portrait of Alexander wielding a thunderbolt was highly esteemed, and preserved in the temple of Diana at Ephesus. With reference to this painting, Alexander said: 'There are only two Alexanders—the invincible son of Philip, and the inimitable Alexander of A.' A. is said to have left an incomplete painting of Venus, to which no other painter would presume to give the finishing touches. The disposition of A. was remarkably free from envy, and he willingly acknowledged the merits of his contemporaries. Amphion, he said, excelled him in grouping, and Asclepiodorus in perspective, but *grace* was his alone. On coming to Rhodes, and finding that the works of Protogenes were not appreciated by his countrymen, he at once offered him fifty talents for a picture, and spread the report that he intended to sell it again as his own. The industry with which he practiced drawing was so great as to give rise to the proverb *Nulla dies sine lineâ*. Many other anecdotes are related of A.

When his pictures were exposed to public view, he used to place himself behind a picture, to listen to the criticisms of the common people. A cobbler having detected a fault in the shoe of one of his figures, it is said that A. instantly rectified it; but when the cobbler, on the following day, extended his criticism to the legs, the painter rushed from his hiding-place, and told the cobbler to stick to the shoes; or, in the Latin version, which has become proverbial, 'Ne sutor supra crepidam.'

A'PENNINES (Ital. *Appenni'ni;* anciently, Lat. *Mons Apennînus*), a mountain-chain extending uninterruptedly throughout the whole length of the Italian peninsula. It lies between 37° and 44° 30′ N. lat. and 7° 40′ and 18° 20′ E. long., and belongs to the system of the Alps, from which it branches off at the Col de Tenda, near the sources of the Tanaro. From this point, the chain, under the name of the Ligurian A., girdles the Gulf of Genoa, in the immediate vicinity of the sea, and then runs inland to a considerable extent, forming the water-shed between the Adriatic and the Mediterranean, but gradually approaching the east coast, till, in the highlands of the Abruzzi, it is close upon it; after which it takes a south-western direction through Naples, dips under the sea at the Strait of Messina, and reappears on the northern coast of Sicily. Recent geographers divide the A. as follows: 1. *The North A.*, from the Col de Tenda in the Maritime Alps to the pass of Borgo San Sepolcro, in the neighborhood of Arezzo, on the eastern border of Tuscany. 2. *The Central A.*, from Arezzo to the valley of the Pescara, which flows between the two Abruzzi. 3. *The South A.*, from the valley of the Pescara to Cape Spartivento. 4. *The Insular A.*, or the Sicilian range. The leading feature of the A., wherever they approach the coast, is their extraordinarily steep declivities; while in Middle Italy and the adjoining portions of Upper and Lower Italy, long terraced plateaus, lower ranges, and finally extensive coast-plains, mark their gradual descent on the west. The general name for these lower ranges is *Sub-Apennine;* but they have a variety of particular designations, such as, the Mountains of Carrara and Seravezza, Pratomagno and Monte Amiata in Tuscany; the Sabine, Alban, and Volscian mountains, in the former Papal States; Monte Gargano on the south-east coast, north of Manfredonia, &c. The main chain of the A. does not send off spurs into the Apulian peninsula, or heel of Italy, which, for the most part, is rather level, or only interspersed with detached groups of hills.

The direction of the great chain of the A. is favorable to the formation, on the west side, of important river-basins, such as those of the Arno, the Tiber, the Garigliano, and the Volturno; while, on the east side, we find nothing but small streams, in most cases, destitute of affluents, hurrying down to the sea through wild precipitous valleys. In Northern Italy, the Ligurian A., almost overhanging the Gulf of Genoa, can only develop on the south puny streams, while the north sends down, through the plains of Piedmont, large tributaries to the Po.

The average height of the entire chain of the A. is about 4000 feet, which, however, in the north, sinks down to little more than 3500 feet; and in the mountains of the Abruzzi, rises to 7000 feet. Here, in Monte Corno, the highest peak of the range known under the name of Gran Sasso d'Italia, they reach an elevation of 10,200 feet, and in Monte Velino, of 7850 feet. The North A. at-

tain, in Monte Cimone, situated in the south of Modena, a height of 6973 feet; the South A., in Monte Amara, a height of 9000 feet; the Insular A., if we exclude the isolated peak of Ætna—in Pizzo di Case, a height of 6500 feet.

The A. are crossed by thirteen principal passes: these are, proceeding from N. to S.—1. The Pass of Savona; 2, of Bocchetta; 3, of Cisa; 4, of Monte Cimone; 5, of Porretta; 6, of Pietramala; 7, of Borgo San Sepolcro; 8, of Furlo; 9, of Serravalle; 10, of Aquila; 11, of Isernia; 12, of Arcano and Troja; 13, of Potenza. The prevalent stone is a species of compact limestone, of a whitish-gray color, belonging to the Jura formation. Resting on the limestone is found a more recent formation of sandstone and marl, which is especially abundant in the middle region of the Sub-A., contains an extraordinary number of petrifactions, and must be reckoned as belonging to the upper division of the Parisian limestone. Older formations, however, frequently crop out. Thus, for instance, on the water-shed of the North and Central A. there are found transition clay-slate, grauwacke-slate, &c. The A., especially the Roman and Neapolitan, are distinguished from all other mountain-chains by the rich variety of marbles which they contain. In some places, the quarries seem inexhaustible. Volcanic rocks are numerous in the middle and southern regions, where the ageney of fire has caused very wonderful formations, as, for instance, the crater-lakes of Albano, Nemi, Vesuvius, Solfatara.

The principle chain exhibits, for the most part, a dreary and barren appearance; it looks like a vast wall, with very few projecting peaks to break the dull monotony of the scene, and therefore seldom furnishes any salient points on which the eye of the spectator can rest with pleasure. Naked, riven, covered with thick *débris*, the declivities seem as if scorched by the southern sun. Only in the Abruzzi, in the Sub-A., and above all, in the marble mountains of Carrara and Seravezza, do the bold and magnificent forms of the Alps reappear. Where the A.—in general so poorly supplied with streams—exhibit a trace of Alpine abundance of water, there is no lack of rich pastures and dense forests, but usually only thin grass and wild scrubby bushes cover the stony slopes. The greater number of the roaring forest brooks, in the deep rocky ravines, display, during summer, only a dry bed. Where the mountains dip down to the sea, as at the Riviera of Genoa and the Gulf of Naples, a rich, peculiarly southern vegetation clothes the declivities. Gigantic agaves, Indian figs (*Cactus Opuntia*), myrtle-bushes, orange-groves, hint in these northern lands of the splendors of the tropics. Up to 3000 feet of elevation, cornfields, fruit-bearing chestnuts, and deciduous oaks are found. Beyond this, all vegetation often ceases on the steep and stony sides of the mountains; but at other times the beech or the fir appears in dense forests. There is no region of perpetual snow; but the summit of the Abruzzi and the lofty peaks of Lunigiana, are often covered with snow from October far into May, and send their icy breath so suddenly down into the mild valleys, that the temperature in a few hours sinks 12°—18° F., and a warm spring afternoon is succeeded by a bitter December evening.

APENRA'DE, a town in the Prussian province of Slesvig-Holstein, situated at the bottom of a gulf in the Little Belt, has an excellent harbor, and a considerable amount of shipping. Pop. (1880) 6215. The environs of the town are beautiful. The first historical mention made of A. relates to its destruction by the Slaves in 1148; and, indeed, its position has always laid it open to the casualties of northern war, whether on a large or small scale, as has been especially seen since 1848. Near the town stands the castle of Brundlund, built by Queen Margaret in 1411, in which the bailiff of the place resides.

APE'TALOUS, a term in Botany, applied to flowers or to flowering plants, and signifying that they are destitute of petals or corolla (q. v.). When both the calyx and corolla are wanting, the flower is said to be *achlamydeous* (from the Greek *chlamys*, a covering), or naked. The absence of the whorl of petals sometimes occurs in an exceptional manner in orders or genera ordinarily characterized by its presence. In some plants, as in certain species of the order *Caryophyllaceæ*, petals are sometimes present, sometimes absent, a tendency apparently existing to the suppression of this whorl.

APHA'SIA (Gr. *a*, not, and *phasis*, speech) is a term adopted by the eminent French physician, Trousseau, to denote a remarkable symptom of certain conditions of the nervous system in which the patient is more or less unable to express his thoughts in speech. The disease has been casually noticed by many early observers, amongst whom Dr. Parry of Bath may be especially noticed; but it was not until within the last twenty years that it has received the attention which its great singularity demands. Before receiving its present name, it had been termed *Aphemia* (from *a*, not, and *phemi*, I speak), and *Alalia* (from *laleo*, I talk). Voisin, in an elaborate Memoir on this subject, published in 1865, observes that it may be due to several causes. It may be congenital or acquired, and in the latter case is due to some form of lesion or injury of the anterior lobes of the brain. This fact was observed as long ago as 1825 by Bouillaud; but in 1861, during a discussion of the Anthropological Society of Paris, as to whether certain faculties, such as language, are or are not localized in special parts of the brain, Broca advanced the view, that the faculty of language has its seat not only in the anterior lobes, but in the left lobe, and occupies exactly the external left frontal convolution, where the anterior lobe meets the middle lobe immediately in front of the fissure of Sylvius. This singular conclusion was deduced from only two post-mortem examinations which had just occurred at the Bicêtre, but a number of previously published cases supported it; and Dr. Hughlings Jackson, of the London Hospital, 'has seen about seventy cases of loss or defect of speech with hemiplegia, and in all but one, the hemiplegia was on the right side, indicating disease of the *left* side of the brain.'—*Lancet*, Nov. 26, 1864. Moreover, in the two cases which during the year last named proved fatal in the Edinburgh and Glasgow Infirmaries, Dr. Sanders and Dr. Gairdner traced the disease to the *exact spot* described by Broca. It may be caused by wounds, tumors of various kinds, including hydatids, or by softening of the left anterior lobe, and has occasionally, but very rarely, been found in association with lesions of other parts of the cerebrum, and even of the cerebellum and spinal cord. According to Voisin, in 146 ases, the left anterior lobe was affected in 140, and the right in only 6 cases. A variety of asphasia has been noticed in typhoid fever and in the first stage of small-pox; also in certain chronic cachexias or intoxicants, as, for example, in syphilis and chronic alcoholism; and there are cases in which the affection is purely nervous, and results from epilepsy, an over-taxed brain, &c. The patients in whom true asphasia from disease of the brain occurs, are excellently described by Dr. Gairdner in his essay *On the Functions of Articulate Speech*, &c. (Glasgow, 1866). This description, in a condensed form, is as follows: These patients have been the subject of some form of disturbance of the cerebral functions, sometimes with, but sometimes also without a manifest disturbance of the intellect. It may have been epilepsy or apoplexy, in which latter case, as has been already noticed, there is often paralysis, almost invariably on the right side of the body. This paralysis may be of any extent of completeness, but in many cases the patient has such command over the movements of the tongue and lips, as to show that it is not from paralysis his speech is affected.

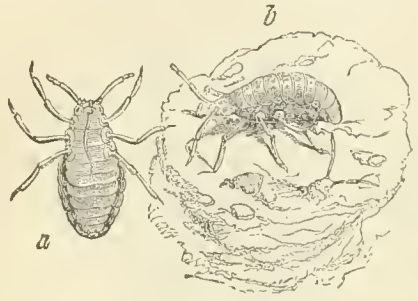
The states of intellect and consciousness are equally variable, the patient occasionally appearing and behaving as if he were in perfect bodily and mental health, except for the aphasia. Moreover, the aphasia itself shows itself in the most varied forms. In the more trivial cases, it is little more than an aggravation of the common defect of forgetting, or being unable to recall the name of a person or thing when wanted. Dr. Gairdner records the case of what he calls 'an aphasic,' who could conduct an ordinary conversation pretty well, but who could not name the days of the week, and would, for instance, call Monday 'the first working-day,' and who had forgotten, or could not give utterance to his own name. Sometimes a patient will perfectly articulate such expressions as these: 'I want——, I want—— Where's the' ——, almost always stopping short at the name of the object. Sometimes the patient's vocabulary is limited to one or two common words, as 'Yes' or 'No;' or perhaps he utters only one or more unintelligible words, as in the case of one of Trousseau's patients, who for four months uttered nothing but '*Cousisi*' to every possible question, unless when in moments of great irritation, and he would then articulate '*Sacon, sacon*'—probably an abbreviation for a French oath. Strange to say, certain aphasics who can articulate absolutely nothing else, can swear with perfect facility. Such exclamations as 'Oh!' 'Dear me!' 'God bless my life!' and 'D—n it!' are often the only utterances of these patients. Dr. H. Jackson, in a Memoir on Aphasia, in the first volume of the *London Hospital Reports*, has made some excellent remarks on this peculiarity, which are well worthy of perusal by all who study mental philosophy. He ingeniously regards an oath not as a part of language, but as 'a sort of detonating comma.' The general reader may also read with advantage the histories of two cases recorded by Trousseau, in which Frenchmen of high mental capacity, and well acquainted with the disease (one of them an eminent physician in Paris, who had specially studied the diseases of the brain; and the other, Professor Lordat of Montpellier), have passed through attacks of aphasia have recovered, and have described their own cases.

Aphasia may be either temporary or persistent; in the former case, being due to loss of nervous energy, congestion, or some other functional disorder; while in the latter case, it is probably associated with disease of structure. It is unnecessary to describe the treatment, which varies according to the peculiarity of each individual case, and must be left solely in the hands of the physician.

APHE'LION, that point in the elliptical orbit of a planet which is most remote from the sun. The opposite point, or that nearest

to the sun, is styled the PERIHELION. At the former point, the swiftness of the planet's motion is least, and begins to increase; at the latter, it is greatest, and begins to decrease. This irregularity of motion is most remarkable in comets whose orbits deviate most from the circle. The motion of the comet of 1680, at its perihelion, was calculated as 137,000 times more rapid than its motion in A. See APSIDES.

A'PHIS, a genus of insects belonging to the order Hemiptera, sub-order Homoptera—the type of a family called *Aphidii*. They are small insects, living by sucking the juices of plants, upon

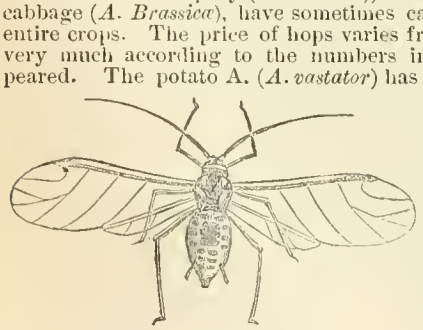


Apple Aphis (*Eriosoma Mali*):
a, wingless insect, magnified; *b*, wingless insect in excrescence of the tree, magnified.

which they may be seen congregated in immense numbers, often doing serious injury, causing the distortion of leaves, and even the blight and decay of the plant. The woolly Aphis, or American Blight (*A. lanigera; Eriosoma Mali* of Leach), is sometimes very injurious to apple-trees, and when once it has found its way into a garden or orchard, it is very difficult of removal. It is a minute

Apple Aphis:
a branch with excrescences, reduced.

insect, 'covered with a long cotton-like wool, transpiring from the pores of its body'—'a cottony excretion'—in which it differs from the ordinary aphides, and takes its place in the chinks and rugosities of the bark, multiplying rapidly, extracting the sap, causing diseased excrescences, and, ultimately, the destruction of the tree. It was first observed in England in 1787; but it is uncertain if it was, as has been supposed, accidentally imported from America. The Hop-fly (*A. Humuli*), and the A. of the turnip and cabbage (*A. Brassicæ*), have sometimes caused the destruction of entire crops. The price of hops varies from one year to another, very much according to the numbers in which '*the fly*' has appeared. The potato A. (*A. vastator*) has been represented as the cause of the potato disease; but this opinion has few supporters. The aphides of the rose (*A. Rosæ*) and of the bean (*A. Fabæ*) are among the most familiarly known. Every one must have observed the leaves of trees and shrubs deformed by red convexities. In the hollows of the under side of these, aphides have their habitation, and there they find their food; the exhausted leaf at last curls up. Most of the species are green; the A. of the bean is black. They are generally called Plant-lice. They have a proboscis (*haustellum*), by which they pierce and suck plants; and at the extremity of the abdomen, two horn-like processes, from which exude frequent small drops of a saccharine fluid called *Honey-dew*, a favorite food of ants. It has been seen even to fall in a kind of shower from trees much covered with aphides. Mention has been made in the article ANT, of the means which ants take to obtain this food. The legs of aphides are long, and they move slowly and awkwardly by them. The greater number of them never have wings; It is in the autumn that perfect winged insects generally appear.



Potato Aphis (*Aphis vastator*).
magnified fifty times.

From the pairing of these result eggs, which produce female aphides in the following spring, and successive generations of wingless aphides are produced in a viviparous manner without impregnation throughout the summer, after which winged aphides again appear. Their increase is restrained not only by birds, but by insects which feed on them. A family of coleopterous insects, to which the genus *Coccinella* or Lady-bird (q. v.) belongs, has received upon this account the name of *Aphidiphagi*, or aphis-eaters. There are also certain minute hymenopterous insects, which destroy them in great numbers by depositing their eggs in them; the larva feeds upon the living A., out of which it at last eats its way, leaving a mere desiccated skin.

APHO'NIA (Gr. *a*, not, and *phone*, voice) is the term used in Medicine to signify a more or less complete loss of voice. It is altogether distinct from mutism, in which it is impossible to form articulate sounds, and in most cases the voice is not entirely gone, but only more or less lost or suppressed. The voice is essentially produced (as has been proved in the special article on that subject) by three distinct agents—viz., (1) the expiration of air, (2) the opening of the glottis, and (3) the tension of the vocal cords—and hence anything interfering with expiration, or with the functions of the glottis and vocal cords, may cause aphonia. Thus, it may result from paralysis of the respiratory muscles, from pulmonary emphysema, and sometimes from pneumonia; or it may be caused by diseases of the larynx, as chronic laryngitis, œdema of the glottis, polypus, &c.; or by pressure on the larynx caused by abscesses, vegetations, and any kind of morbid growth; or it may be traced to some functional or organic disturbance of the inferior vocal cords. Thus, the muscular fibres which act on these cords may become affected in acute laryngitis by extension of the inflammation, or their action may be impeded by the pressure of false membrane in croup. In typhoid fever, the aphonia which is so commonly observed is due to ulceration extending to these structures. Again, in cases of lead or phosphorus poisoning, there is aphonia due to fatty degeneration of these muscles. Not unfrequently, aphonia may be traced to compression of the recurrent or inferior laryngeal nerve, which is the nerve supplying motor power to all the muscles of the larynx, with one trifling exception.

Such pressure is not unfrequently caused by an aneuris, an abscess, tumor, &c. In the same way, a wound or contusion of the pneumogastric nerve, or one of the recurrent branches, will cause aphonia, or, more commonly, an extremely hoarse modification of the voice, in consequence of the laryngeal muscles being paralyzed on one side, and remaining active on the other. There are cases of direct nervous action being interfered with; but there are many cases of what may be termed *reflex aphonia*, as when the voice is often more or less lost in the course of pregnancy when accompanied with convulsions, or in consequence of the presence of intestinal worms, or after the rapid suppression of an exanthematous rash, or of a long-continued hæmorrhagic discharge. Aphonia is, moreover, very commonly associated with hysteria.

When aphonia is not due to irremovable causes, as tumors pressing on the recurrent nerve, fatty degeneration of the laryngeal muscles, &c., it generally disappears after a longer or shorter interval. It occasionally assumes remarkable intermittent shapes. In one instance, the affection came on regularly at the same time of the year for seventeen years, beginning daily at noon, and lasting the remainder of the day, for a period varying from three to seven months. Another case is recorded in which, during fourteen years, a young woman could only speak during two or three hours daily.

In those cases which are amenable to treatment, emetics, electricity, strychnine, leeching, blistering, croton-oil liniment, and internal application of nitrate of silver, have been found to be the most useful remedies.

A'PHORISM, a maxim, or any short and significant saying; such as, 'Custom is a second nature.' A whole piece or work is sometimes written in the form of a series of aphorisms, arranged in due order, and leaving their connection to be traced by the reader's reflection. In certain circumstances this aphoristic style has an impressive effect; but long continued, it becomes wearisome.

APHRODI'TÉ, the Greek name of Venus, according to various traditions, is derived from *aphros* (foam), in allusion to the old poetical myth which represented the goddess as springing from the foam of the sea. See VENUS and APELLES. *Aphrodisia* were festivals celebrated in honor of A., in numerous cities of Greece, but especially in Cyprus. At Paphos, in this island, was her most ancient temple. Bloodless sacrifices alone were imagined to please A., such as flow-

ers, incense, &c. Mysteries of an impure kind formed part of the ceremonial of the aphrodisia. Aphrodisia were no doubt held in the other places where A. was worshiped, such as Cythera, Sparta, Thebes, Elis, &c., though they are not mentioned. At Corinth and Athens, the aphrodisia were celebrated principally by prostitutes.

API'CEÆ. See UMBELLIFERÆ.

APIACERE. See AD LIBITUM.

A'PIARY. See BEE.

API'CIUS, MARCUS GABIUS, a Roman epicure, who lived in the times of Augustus and Tiberius, and was celebrated for his luxurious table and his acquirements in the art of cookery. When, by the gratification of his favorite indulgence, he had consumed the greater part of his fortune, and had only some £80,000 left, he poisoned himself, in order to avoid the misery of plain diet. Two other gourmands—one in the time of Pompey, the other in the reign of Trajan—are mentioned under the name Apicius. The Roman cookery-book *Cælii Apicii de Obsoniis et Condimentis sive de re Culinariâ* (libri decem), ascribed to A., belongs to a much later time, inasmuch as it abounds in inaccuracies and solecisms. Its author *Cælius* has thought proper to recommend his work to gourmands by affixing to it the celebrated name of Apicius.

A'PION, a Greek grammarian, was born at Oasis, a town in Libya, but educated in Alexandria, which he affected to consider his birthplace, from a desire of being thought a pure Greek. He studied under Apollonius, the son of Archibius, from whom he acquired an admiration of Homer, and afterwards went to Rome, where he succeeded Theon as teacher of rhetoric. He seems to have been as remarkable for his loquacious vanity as for his knowledge. He declared that himself, and every one whom he mentioned, would be held in immortal memory, that he was equal to the first philosophers of Greece, and that Alexandria should be proud of him. From his bragging, Tiberius used to call him *Cymbalum Mundi* (the cymbal of the universe).

With the exception of one or two fragments, the whole of A.'s numerous writings are lost. He composed a work on the text of Homer, partly in the form of a dictionary, which was frequently referred to by subsequent authors; a work on Egypt, which contained the far-famed story of *Androclus and the Lion*, preserved by Aulus Gellius; a work against the Jews; one in praise of Alexander the Great; another on the great epicurean Apicius; histories of various countries, &c.

A'PIOS TUBERO'SA, formerly included in the genus *Glycine*, and called *G. Apios*, a plant belonging to the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having tuberous roots, a twining stem, dark red flowers, leathery, 2-valvular legumes, and pinnate leaves, with seven pair of smooth ovato-lanceolate leaflets. This plant, which is a native of Virginia, has for a century been cultivated in botanic gardens in Europe, and has recently been brought into particular notice on the continent, in a great measure through the French traveler Lamare-Picquot, who, during his travels in North America, convinced himself of the value of the tubers as an article of food, for which they are there used to some extent. Various attemps have since been made to cultivate it like the potato; but its cultivation is found difficult, upon account of the length and weakness of the twining shoots and the length of the roots. The tubers cooked in steam are free from all acridity and bitterness, and very much resemble potatoes dressed in the same way. They contain more nitrogen than potatoes (4·5 per cent.), also more starchy farina (33·55 according to an analysis by Payen).

A'PIS, the bull worshiped by the ancient Egyptians, who regarded it as a symbol of Osiris, the god of the Nile, the husband

Apis.—Golden Calf.

of Isis, and the great divinity of Egypt. A sacred court or yard was set apart for the residence of A. in the temple of Ptah at Memphis, where a numerous retinue of priests waited upon him, and sacrifices of red oxen were offered to him. His movements, choice of places, and changes of appetite, were religiously regarded as oracles. It was an understood law that A. must not live longer than twenty-five years. When he attained this age, he was secretly put to death, and buried by the priests in a sacred well, the popular belief being that he cast himself into the water. If, however, he died a natural death, his body was solemnly interred in the Temple of Serapis at Memphis, and bacchanalian festivals were held to celebrate the inauguration of a new bull as A. As soon as a suitable animal was found having the required marks—black color with a white square on the brow; the figure of an eagle on the back, and a knot in the shape of a cantharus under the tongue—he was led in triumphal procession to Nilopolis at the time of the new moon, where he remained forty days, waited upon by nude women, and was afterwards conveyed in a splendid vessel to Memphis. His Theophany, or day of discovery, and his birthday, were celebrated as high festivals of seven days' duration during the rise of the Nile. The worship of the golden calf by the Israelites in the wilderness, and also the employment of golden calves as symbols of the Deity by Jeroboam, have been very generally referred to the Egyptian worship of A.

A'PIS, APIDÆ. See BEE.

A'PIUM. See CELERY.

APO'CALYPSE. See REVELATION OF ST. JOHN.

APOCALY'PTIC NUMBER is 'the mystical number' 666, spoken of in the book of Revelation (xiii. 18). As early as the 2d c., the Church had found that the name, Antichrist, was indicated by the Greek characters expressive of this number; while others believed it to express a date. The most probable interpretation is that which was current in the days of Irenæus, and which found the number in the word *Lateinos* (*Latinus*). The Roman nation—the mightiest pagan power on earth—was the most terrible symbol of Antichrist, and the number 666 appears in the Greek characters which spell the name. Protestant controversialists very generally support their views by this interpretation, applying the prophecy to papal Rome. See ANTICHRIST in AM. SUPP.

APOCA'RPOUS FRUITS, in Botany, are those fruits which are the produce of a single flower, and are formed of only one carpel, or of a number of carpels remaining free and separate from each other. The term is derived from the Greek *apo*, implying separation, and *carpos*, fruit.

A POCO A POCO (Ital.), in Music, by degrees; by little and little.

APOCRE'NIC ACID is one of the products of the natural decay of wood and other plant textures, and is found wherever lignine or woody fibre is decomposing in soils, &c. As A. A. is soluble in water, it follows that rain-water falling on and percolating through soils containing this substance, becomes impregnated with it; and hence, in many natural waters, A. A. is a recognized constituent. A. A. performs an important function in the growth of plants, as there is every reason to believe that it forms one of the stages through which matter travels from dead plants again into the living vegetable tissue.

APO'CRYPHA, or APOCRYPHAL WRITINGS. The word originally meant *secret* or *concealed*, and was rendered current by the Jews of Alexandria. In the earliest churches, it was applied with very different significations to a variety of writings. Sometimes it was given to those whose authorship and original form were unknown; sometimes to writings containing a hidden meaning; sometimes to those whose public use was not thought advisable. In this last signification, it has been customary, since the time of Jerome, to apply the term to a number of writings which the Septuagint had circulated amongst the Christians, and which were sometimes considered as an appendage to the Old Testament, and sometimes as a portion of it. The Greek Church, at the Council of Laodicea (360 A.D.), excluded them from the canon; the Latin Church, on the other hand, always highly favored them; and finally the Council of Trent (1545—1563) placed them on an equality with the rest of the Old Testament. The Church of England uses them in part for edification, but not for the 'establishment of doctrine.' All other Protestant churches in England and America reject their use in public worship.

But it was once customary to bind up the A. between the authorized versions of the Old and New Testaments, though this has now ceased, and, as a consequence, this curious, interesting, and instructive part of Jewish literature is now known only to scholars. The Old Testament A. consists of 14 books: 1. First Esdras (q. v.); 2. Second Esdras (q. v.); 3. Tobit (q. v.); 4. Judith (q. v.); 5. The parts of Esther not found in Hebrew or Chaldee; 6. The Wisdom of Solomon; 7. The Wisdom of Jesus, son of Sirach, or Ecclesiasticus (q. v.); 8. Baruch (q. v.); 9. The Song of the Three Holy Children; 10. The History of Susanna; 11. The History of the Destruction of Bel and the Dragon (q. v.); 12. The Prayer of Manasses, King of Judah (see MANASSEH); 13. First

Maccabees (q. v.); 14. Second Maccabees (q. v.). The precise origin of all these writings cannot be ascertained. It is enough to state here that some bear traces of a Palestinian, others of an Egypto-Alexandrine, and others, again, of a Chaldaico-Persian origin or influence. Most, if not all, bear internal evidence of having been composed in the 1st and 2d centuries B.C.

The A. of the New Testament may be arranged under three heads. 1. The writings comprising the *Apocryphal Gospels*, which consist of 22 separate documents, 10 in Greek and 12 in Latin. They concern themselves with the history of Joseph and of the Virgin Mary before the birth of Christ, with the infancy of Christ, and with the history of Pilate. The most important of the set are the *Protevangelium of James*, the *Gospel of Thomas*, and the *Acts of Pilate*, which are perhaps the *origines* of all the apocryphal traditions. That many of the stories found in these were current in the 2d century, is abundantly proved, but we have no evidence that any of the books known as Apocryphal Gospels were then in existence, or are older than the 4th century. 2. The *Apocryphal Acts of the Apostles*, consisting of 13 documents originally written in Greek, but found also in a Latin compilation probably of the 6th century. They are distinguished from the Apocryphal Gospels by having less of miracle and more of didactic discourse. The more important of the collection are *The Acts of Peter and Paul*, *The Acts of Barnabas*, *The Acts of Philip*, *the Acts of Andrew*, *the Acts of Bartholomew*, and *The Acts of John*. It is difficult to ascertain their age. Some are probably of earlier date than the Apocryphal Gospels, but the original MSS. are lost, and we only possess them in late transcripts of the middle ages. 3. The *Apocryphal Apocalypses*, consisting of seven documents, four of which are called apocalypses by their authors. There is great and perplexing variety in the MSS. That called *The Apocalypse of Moses* relates rather to the Old Testament than to the New; so does *Apocalypse of Esdras*, which is a weak imitation of the Fourth Book of Esdras. The others are *The Apocalypse of Paul*, *The Apocalypse of John*, and *The Assumption of Mary* in three forms. These, too, only exist in late MSS. of the middle ages, and it is, of course, not quite certain that they are the same in form as the works bearing the same name referred to in the writings of the Fathers.

The New Testament A. is not without interest or instruction for us. It throws a flood of light upon the workings of the early Christian consciousness and modes of thought, and it also enables us to appreciate the vast superiority of those Scriptures which have obtained canonical authority.—See Tischendorf's *Prolegomena* to the Apocryphal Literature of the New Testament (Leipsic, 1873); and Clark's *Ante-Nicene Christian Library*, vol. 16 (Edinburgh, 1870).

APOCYNA'CEÆ, or APOCY'NEÆ, a natural order of Dicotyledonous plants, consisting of trees and shrubs, generally with milky juice, having entire leaves and no stipules. The calyx is usually 5-partite, persistent; the corolla hypogynous, monopetalous, often with scales in its throat, regular 5-lobed, twisted in bud. There are five stamens which are inserted on the corolla; the anthers adhere firmly to the stigma, to which the pollen is immediately applied; the anthers are 2-celled, and open longitudinally; the pollen is granular. The ovaries are two, each 1-celled, or one, which is 2-celled; ovules usually numerous; styles 1 or 2; the stigma is contracted in the middle, and peculiarly characteristic of the order. The fruit is a follicle or capsule, or drupe or berry, double or single. The seeds have a fleshy or cartilaginous albumen, or (rarely) are ex-albuminous.—There are about 566 known species, chiefly natives of tropical countries. The PERIWINKLE (q. v.) is its only representative in the flora of Britain, a wanderer, as it were, from the tropics, yet hardly enough for the climate with which it has to contend; the OLEANDER (q. v.) and a few others are found in the south of Europe. Many species are poisonous; amongst which is the noted TANGHIN (q. v.) or TANGHEENA of Madagascar. Some are used in medicine, in India and other countries. A number of species yield CAOUTCHOUC (q. v.). The milk of others is bland and wholesome, as the HYA HYA or COW-TREE (q. v.) of Demerara. Some are used in dyeing; *Wrightia tinctoria* yields indigo of good quality.—A number yield eatable fruits, as *Willughbeia edulis* and *Carissa Carandas* in India; *Carissa edulis* in Arabia, and certain species of *Carpodinus*, called PISHAMIN in Sierra Leone, and *Hancornia*.—*Apocynum cannabinum*, Canadian hemp, a herbaceous plant about 4—5 feet in height, with unbranched stem, oblong leaves, and lateral cymes of whitish bell-shaped flowers, yields a very strong fibre, which the Indians of North America employ for making twine, cloth, fishing-nets, &c.

APO'LDA, a town of the grand duchy of Saxe-Weimar-Eisenach, Germany, on the Werlitz, a feeder of the Saale, eight miles north-east from Weimar. It is a station on the Thuringian Railway, between Weimar and Weissenfels. It is a place of much industrial activity, having extensive manufactures of hosiery. Pop. (1880) 15,630.

A'PODAL FISHES are fishes destitute of ventral fins. In the Linnæan system, the *Apodes* are an order of Fishes, in which genera not otherwise nearly allied are brought together; but in the systems of Cuvier and other recent naturalists, a less important place is assigned to this distinctive character.—Eels are an example of A. fishes.

APODI'CTIC, a logical term signifying a judgment or conclusion which is necessarily true; or, in other words, a judgment of which the opposite is impossible. No A. judgment can be founded on experience, because experience does not supply the idea of an absolute necessity.

A'POGEE (Gr. *apo*, from, and *ge*, the earth), properly speaking, the greatest distance of the earth from any of the heavenly bodies. Its application, however, is restricted to the sun and moon, the sun's A. corresponding to the earth's aphelion, and the moon's A. being the point of its orbit most remote from the earth. A. is opposed to perigee.

APOLLINA'RIS, the Younger, Bishop of Laodicea in Syria (362), and one of the warmest opponents of Arianism. Both as a man and a scholar, he was held in the greatest reverence; and his writings were extensively read in his own day. His father, A. the Elder, who was presbyter of Laodicea, was born at Alexandria, and taught grammar, first at Berytus, and afterwards at Laodicea. When Julian prohibited the Christians from teaching the classics, the father and son endeavored to supply the loss by converting the Scriptures into a body of poetry, rhetoric, and philosophy. The Old Testament was selected as the subject for poetical compositions after the manner of Homer, Pindar, and the tragedians; whilst the New Testament formed the groundwork of dialogues in imitation of Plato. It is not ascertained what share the father had in this work, but as he had a reputation for poetry, he probably put the Old Testament into Greek verse. But it was chiefly as a controversial theologian, and as the founder of a sect, that A. is celebrated. He maintained the doctrine that the *logos*, or divine nature in Christ, took the place of the rational human soul or mind, and that the body of Christ was a spiritualized and glorified form of humanity. This doctrine was condemned by several synods, especially by the Council of Constantinople (381), on the ground that it denied the true human nature of Christ.

The heresy styled Apollinarianism spread itself rapidly in Syria and the neighboring countries, and, after the death of A., divided itself into two sects—the Vitalians, named after Vitalis, Bishop of Antioch; and the Polemeans, who added to the doctrine of A. the assertion that the divine and human natures were so blended as one substance in Christ that his body was a proper object of adoration. On this account, they were accused of *sarcolatria* (worship of the flesh) and *anthropolatria* (worship of man), and also were styled *synousiastoi* (*syn*, together, and *ousia*, substance), because they confused together the two distinct substances. The whole controversy, which occupied a great part of the 5th c., is an instance of human reason wandering out of its proper sphere. A. must not be confounded with Claudius A., Bishop of Hierapolis, in Phrygia (170 A.D.), and who wrote an *Apology* for the Christian faith, and several other works, all of which are lost.

APO'LLO (Gr. APOLLON). A. may be regarded as the characteristic divinity of the Greeks, inasmuch as he was the impersonation of Greek life in its most beautiful and natural forms, and the ideal representative of the Grecian nation. His mild worship, with its many festivals, accompanied as they were by a cessation from all hostilities; his various shrines at sacred places, with their oracles, and the general idea of his character, had a wide, powerful, and beneficent influence on social and political life throughout the states of Greece. Homer and Hesiod mention that he was the son of Zeus and Leto, but neither states where he was born. The Ephesians believed that both he and Diana, his sister, were born in a grove near their city. The Tegyræans of Bœotia, and the inhabitants of Zoster in Attica, also claimed the honor of his birth; while the Egyptians seemed to think he properly belonged to them; but the most popular legend was that which made him a native of Delos, one of the Cyclades, where his mother Leto, followed by the jealous wrath of Juno over land and sea, at length found rest and shelter, and was delivered of him, under the shadow of an olive-tree, at the foot of Mount Cynthus. To spite the Queen of Heaven, who was far from being a favorite with the other goddesses, these hastened to tender their services to the weak and wearied Leto. The young A. was much made of. Themis fed him with nectar and ambrosia, the food of the gods, which seems to have suddenly excited the conceit of the infant deity, inasmuch as he surprised his nurse by starting to his feet, demanding a lyre, and announcing his intention of henceforth revealing to mortals the will of Jove. The island, proud of having been the birthplace of A., adorned itself with a robe of golden flowers.

In ancient literature A. is described as possessed of many and various powers, all of which, however, are seen on closer inspection to be intimately related to each other. He is spoken of: 1. The god of retributive justice, who, armed with bow and arrows,

sends down his glittering shafts upon insolent offenders. In this character he appears in the opening of the *Iliad*. 2. As the instructor of bards, and the god of song and minstrelsy, playing upon the phorminx or seven-stringed lyre, and singing for the diversion of the other deities when engaged in feasting. 3. As the god of prophetic inspiration, especially in his oracle at Delphi. 4. As the guardian deity of herds and flocks. 5. As the god of medicine, who affords help, and wards off evil. In this sense he is represented as the father of Asclepius (Æsculapius), the god of the healing art. 6. As a founder of cities. According to Homer, he assisted Neptune in building the walls of Troy. Cyrene, Naxos in Sicily, and other cities, venerated A. as their founder. By the later writers, A. was identified with Helios, the sun-god, though Homer describes the latter as a distinct deity. Several critics, however, have regarded Helios, or the sun-god, as the true original A.—an opinion which may be supported by many probabilities. The supposition that A. was identical with the Egyptian deity Horus was rejected by the learned O. Müller, who generally opposed all attempts to deduce Grecian from Egyptian mythology. According to Müller's theory, A. was a purely Doric deity, whose first residence was in Tempe, and who afterwards removed to Delphi, whence the fame of his oracle was spread abroad, and made him to be recognized as the national divinity of Greece. The introduction of his worship into Attica appears to have been contemporaneous with the immigration of the Ionians, and that worship would seem to have spread over the Peloponnesus, immediately after it was conquered by the Dorians. Much controversy has taken place, both with reference to the idea which lies at the root of the whole myth of the A. worship, and also as to whether this myth had its origin in the north of Greece or in Egypt. Even on the supposition that the original conception was derived from the latter source, it was to Greek art and philosophy that it owed its development into the ideal of humanity. The most celebrated oracles of A. were at Delphi, Abæ in Phocis, Ismenion in Thebes, Delos, Claros, near Colophon, and Patara in Lycia. Among the Romans, the worship of A. was practised as early as 430 B.C., and prevailed especially under the emperors. But there can be no doubt that the Romans derived their conceptions of A. entirely from the Greeks. It was in honor of A. and his sister Diana that the *ludi sæculares* were celebrated every hundred years. The attributes of A. are the bow and quiver, the cithara and plectrum, the snake, shepherd's crook, tripod, laurel, raven, &c.; less frequently, the grasshopper, cock, hawk, wolf, and olive-tree. In sculpture, he is generally represented with a face beautifully oval, high forehead, flowing hair, and slender figure.

Apollo.

APO'LLO BELVEDE'RE, a celebrated statue of antiquity, which has generally been regarded as embodying the highest ideal of manly beauty. It is generally supposed to represent the 'lord of the unerring bow' in the moment of his victory over the Python, but numerous other explanations have been suggested. The figure (upwards of 7 feet in height) is naked, but a cloak fastened round the neck hangs gracefully over the extended left arm; the expression of the face is one of calm and godlike triumph, mixed with 'beautiful disdain.' This great work of art was discovered in 1503, amid the ruins of the ancient Antium, now Capo d'Anzo, and purchased by Pope Julius II., who placed it in the Belvedere of the Vatican, whence the name it bears. The date of its execution is with probability referred to the reign of Nero, but the name of the artist is a matter of mere conjecture. The left hand and the right fore-arm, wanting in the statute as discovered, were restored by G. A. da Montorsoli, a pupil of Michael Angelo.

Apollo Belvedere.

APOLLODO'RUS, an Athenian painter, who flourished about 408 B.C., and was the predecessor of Zeuxis. He introduced improved coloring and distribution of light and shade.—A., a celebrated architect in the time of the emperor Trajan, by whom he was employed to construct a bridge over the Danube in Lower Hungary. His severe censure, boldly pronounced on a design for a temple of Venus, which the emperor Hadrian had sent to him, caused A. to be sentenced to death in 129 A.D.—A., a Greek grammarian lived about 140 B.C., studied philosophy in Athens, and grammar under Aristarchus; wrote a work on mythology, giving an arrangement of old myths from the earliest times to the historical period; also a geography, a chronicle in iambic verse, and several grammatical works. The mythology, which begins with the origin of the gods, probably went down as far as the Trojan cycle, but a portion of it has perished. It has been reckoned by some only an extract from a larger work by A., though this is a mere hypothesis, based on the fact that the legends are given with extreme simplicity and brevity. The work is one of great value to classical scholars. An edition of the *Bibliotheca* of A., in 4 vols., was published at Göttingen, 1782—1783, by C. H. G. Heyne.

APOLLO'NIUS, the name of several celebrated Greek grammarians and rhetoricians. A., surnamed DYSCOLOS (or ill-tempered), of Alexandria, lived in the 2d c. Some of his grammatical works were edited by Bekker. A. was the first who reduced grammar to a system. His reputation was so high, that Priscian calls him *grammaticorum princeps* (the prince of grammarians).—A., son of Archebulus, also of Alexandria, lived in the time of Augustus, and was the author of a lexicon of Homeric words.—A., surnamed Molon, was a teacher of rhetoric at Rhodes, and also gave lectures at Rome, where he was highly esteemed by Cicero and Cæsar.—A. of PERGA, 240 B.C., is classed with Euclid, Archimedes, and Diophantus, as one of the founders of the mathematical sciences. His work on conic sections has been preserved, partly in the original Greek, partly in an Arabic translation.—A. OF RHODES (or of Alexandria, say some authorities), born 235 B.C., wrote many works on grammar, and an epic poem, entitled the *Argonautica*, marked rather by learning and industry than by poetical genius, though it contains some truly artistic passages, such as those exhibiting the growth of Medea's love. Is was greatly admired by the Romans, was translated into Latin by Publius Terentius Varro, and was imitated, not only in a wholesale manner by Valerius Flaccus, but even by Virgil in some passages. It has been edited by the German scholars Brunck and Wellauer (Leipsic, 1813—1828).

APOLLO'NIUS, OF TYANA, in Cappadocia, who lived in the time of Christ, was a zealous follower of the doctrines of Pythagoras. He soon collected a considerable number of disciples, traveled through a great part of Asia Minor, and endeavored to find his way to India, in order to become acquainted with the doctrine of the Brahmins. On this journey he stayed for a time in Babylon, was introduced to the Magi, and at last reached the court of King Phraortes, in India, who recommended him to Jarchas, the principal Brahmin. When A. returned from this pilgrimage, his fame as a wise man was greatly increased; the people regarded him as a worker of miracles and a divine being, and princes were glad to entertain him at their courts. He himself seems to have claimed insight into futurity, rather than the power of working miracles. From Rome he was expelled on a charge of having raised a young woman from the dead. After extensive travels in Spain, Italy, Greece, and Ethiopia, he was accused of having taken part in an insurrection against Domitian; but appeared before the tribunal, and was acquitted. Ultimately, he appears to have settled in Ephesus, where he opened a Pythagorean school, and continued his teaching until he died, nearly one hundred years old. His history was written about a hundred years after his death by Philostratus (q. v.). It contains a mass of absurdities and fables, through which an outline of historical facts and the real character of the man are sufficiently discernible. Hierocles, a heathen statesman and opponent of Christianity, wrote, in the 3d c., a work on the life and doctrines of A., with a view to prove their superiority to the doctrines of Christ. In modern times, the notorious English freethinker Blount, and Voltaire in France, have renewed the attempt.

APOLLO'NIUS, of TYRE, the hero of a Greek romance, which enjoyed great popularity in the middle ages, and was translated into almost all the languages of Western Europe. In it are related the romantic adventures which befell A., a Syrian prince, previous to his marriage with the daughter of King Alcistrates, of Cyrene. To these are added the adventures of his wife, who was parted from him by apparent death, as well as those of his daughter, Tarsia, who was carried off by pirates, and sold in Mitylene. The poem closes with the reunion of the whole family. The original Greek work no longer exists; but there are three very early Latin versions, of which one was published by Welser (Augsburg, 1595); another is to be found in the *Gesta Romanorum;* and the third in the *Pantheon* of Gottfried of Viterbo. From this Latin source have proceeded the Spanish version of the 13th c., printed in Sanchez' *Coleccion de Poesias Castellanas* (2d edition, Paris, 1842), several French versions, in prose and verse, as well as several Italian. As early as the 11th c. there was an Anglo-Saxon adaptation of the work, and subsequently various English ones appeared. Shakspeare has treated the subject in his drama of *Pericles;* he substantially follows Gower, in his *Confessio Amantis*, who bases his narrative on the *Pantheon* of Gottfried of Viterbo. Three popular English stories, drawn from a French version of

this romance, appeared in London in 1510, 1576, and 1607; while the Dutch, in 1493, derived theirs from the German. The romance was rendered into German, probably from the *Gesta Romanorum*, by a certain 'Heinrich von der Neuenstadt' (i. e., Vienna), about the year 1300, in the form of a long and, as yet, unpublished poem. Later, we have a *Histori des Küniges Appolonii*, translated from Gottfried of Viterbo, and first published at Augsburg in 1476. Simrock, in his *Sources of Shakspeare*, narrates the story as it is given in the *Gesta Romanorum*. A modern Greek translation of the Latin romance, undertaken in 1500 by Gabriel Contianus, of Crete, and several times reprinted at Venice, must not be confounded with the lost Greek original.

A'POLOGUE, a fable, parable, or short story, intended to serve as a pleasant vehicle of some moral doctrine. One of the oldest and best apologues or parables is that by Jotham, as given in the Book of Judges (ix. 7—15). Another celebrated A. is that of the 'Limbs and the Body,' related by the patrician Menenius Agrippa. Æsop's fables have enjoyed a world-wide reputation. Luther held such an opinion of the value of the A. as a vehicle of moral truth, that he edited a revised Æsop, for which he wrote a characteristic preface. He says: 'In doing this, I have especially cared for young people, that they may receive instruction in a style suitable to their age, which is naturally fond of all kinds of fiction; and I have wished to gratify this natural taste without indulging anything that is bad.'

APO'LOGY. The term is now commonly understood as synonymous with an excuse for breach of an engagement, &c., but was originally used as the title of any work written in defence of certain doctrines, as in the *A. of Socrates*, ascribed to Plato and Xenophon; the *A. for the Christians*, by Tertullian, and in many other defences of the Christians, written by Justin Martyr, Athenagoras, Tatian, Theophilus, Origen, Eusebius, Minucius Felix, Arnobius, Lactantius, Augustine, Orosius, and others. The attacks parried or retorted in these apologetical works are such as charges of atheism, want of philosophical knowledge, anti-social tenets, &c. Both the charges and the refutations brought forward serve to give us an insight into the character of the times when these works were written. Thus, in the A. by Tertullian, it is curious to find a formal argument employed to refute the assertion that the spread of Christianity was the cause of 'earthquakes' and other natural phenomena which had occurred in some parts of the Roman empire. After the fourth century, when the church was made dominant under the Roman emperors, apologetical writings were less called for; but Bartholus Edessenus and Raymundus Martinus wrote against the Jews and the Mohammedans. In the 15th c., when the revival of learning placed Christianity in apparent opposition to the Platonic philosophy, Marsilius Ficinus wrote in defence of revelation; and some time after the Reformation, the spread of free-thinking and scepticism in England was opposed by a variety of apologetical works, chiefly maintaining the points that Christianity is a divine revelation, Christ a divine messenger, and his church a divine institution. The defence of Christianity on grounds of reason came now to be treated as a distinct branch of theology, under the name of *Apologetics*. Among the numerous apologetic works by Protestants, may be mentioned those by Grotius (*De Veritate*, &c.), Butler (*Analogy of Religion, Natural and Revealed*), Lardner (*Credibility of the Gospel History*), Leland, Addison, Soame Jenyns (*Internal Evidences of the Christian Religion*), Hugh Farmer, Bishop Watson (*A. for Christianity*), Paley (*Evidences of Christianity*, and *Horæ Paulinæ*), &c. Among Roman Catholic apologetic writers, the most eminent are Pascal, Houteville, Guenée, Bergier, Mayr, and Chateaubriand.

Recently, a great number of apologetic works by Neander, Tholuck, and others have appeared, in reply to Strauss's *Life of Jesus*, and the *Vie de Jésus* by Joseph Ernest Renan.

APONEURO'SIS is an anatomical term for an expansion of strong fibrous tissue, of which there are many examples in the human body. For the sake of convenience, it is generally confined to expansions from the tendons of muscles, as the lumbar A. If a tendon is very broad and expanded, as that of the external oblique muscle of the abdomen, it is said to be aponeurotic. Some muscles, as those on the shoulder-blade, are partially covered with a tendinous expansion, to which some of their fibres are attached; this is termed the aponeurotic *origin* of the muscle; it gives the muscle a more extensive attachment, without adding materially to weight. Aponeuroses stretch in some localities as protections over large arteries; thus, in bleeding from the vein nearest the inside of the bend of the elbow, the only structure between it, the lancet and the brachial artery, is an aponeurotic expansion from the biceps tendon into the muscles of the fore-arm. See FASCIA.

A'POPHTHEGM (Gr., an utterance), a term used to designate any truth or maxim sententiously expressed. The oracles of the heathen gods often took this form, as also the proverbs, memorable sayings, &c., of the sages of antiquity. In modern times, Lord Bacon has made a charming collection of apophthegms.

A'POPLEXY is a term applied to an engorgement of blood, with or without extravasation, in or upon any organ, as the brain (*cerebral* A.), the *spinal* cord or lungs (*pulmonary* A.). As popularly used, the term denotes vaguely a condition arising from some disturbance within the head. A. occurs in *fits*, which may be sudden or come on by degrees. They are characterized by loss of sense and motion, speechlessness and heavy sleep, with stertorous respiration and a slow pulse. The fit may last from a few hours to two or three days, and passes off, leaving generally more or less paralysis, and recurs at intervals of months or years. The *age* at which A. occurs most commonly is from fifty to seventy, and is comparatively rare before and after these ages. Cerebral A. may arise from mere congestion of the blood-vessels of the brain, caused by impeded return of the venous blood, as from the military stock pressing on the jugular veins, keeping the head long in one position, or turning it quickly. Stout persons, with short necks, are more liable to this form of A.; though lean persons are also frequently its victims. But in addition to congestion, there may be an escape of the watery portion of the blood from the congested vessels, and this collecting, produces *serous* A.; or, owing to a diseased condition of the arterial walls, the vessels may burst, and A. from cerebral hemorrhage be the result; the latter is the most common, and is usually preceded by some softening of the brain substance itself. If this bleeding be to any great extent, death results; if only a small quantity escapes, it coagulates, and forms a clot, which is absorbed in time. Persons with diseased heart and lungs, and pregnant females, are liable to apoplectic fits. The attack is generally preceded by vertigo, headache, partial or temporary loss of memory, and occasionally double vision. When these warnings occur, medical advice should be sought to correct the digestive functions; and by relieving the oppressed brain, ward off the fit. When the latter occurs, the patient's head should be raised, cold applied, and in some cases blood should be withdrawn from the temporal artery or external jugular vein. As soon as possible, purgative medicines should be administered. For the results of A., see PARALYSIS. Tumors within the skull produce symptoms of A.

APO'STATE literally designates any one who changes his religion, whatever may be his motive; but, by custom, the word is always used in an injurious sense, as equivalent to renegade, or one who, in changing his creed, is actuated by unworthy motives. In early Christian times, the word was applied to those who abandoned their faith in order to escape from persecution; but it was also applied to such as rejected Christianity on speculative grounds (the Emperor Julian, for instance). After the 5th c., when heathenism was declining, many who had no sincere belief in Christianity, yet made profession of it, and were baptized: these also were styled apostates. The apostates in times of persecution were styled variously Sacrificati, Thurificati, &c., according to the modes in which they publicly made known their return to heathenism, by offering sacrifices or incense to the gods of Rome. The Roman Catholic Church at one period imposed severe penalties on apostasy. The apostate was of course excommunicated; but sometimes also his property was confiscated, and he himself, banished, or even put to death. It has often been of great moment to the fortunes of a nation that a prince has apostatized. The most renowned instance in modern history, is that of Henry IV. of France. In 1833 there was published, at Erlangen, *A Gallery of Important Persons who in the 16th, 17th, and 18th Centuries went over from the Protestant to the Roman Catholic Church*.—The term APOSTASY is now employed commonly, and often abusively, as a reproach for great or sudden changes in political opinions.

APO'STLE (Gr. *apostolos*, sent forth, sent on a mission), any messenger whatever, but especially used to denote the twelve disciples whom Jesus sent forth to preach the gospel. Their names were Simon Peter, Andrew, John (the son of Zebedee), James (his brother), Philip, Bartholomew (called also Nathaniel), Thomas, Matthew (surnamed Levi), James (the son of Alphæus), Thaddeus, Simon, and Judas Iscariot. Subsequently, Matthias was chosen in the room of Judas; and at a still later period, the number of the apostles were further increased by the calling of Paul to the apostleship. The term is sometimes used in the New Testament in its more general signification. Barnabas is styled an A. (Acts xiv.). It is a point of controversy between the supporters and opponents of episcopacy, whether or not the term A., as indicating an office, is applied to any except the original twelve, Matthias and Paul; it being maintained, on the one hand, that the office is perpetuated in bishops; on the other, that it was temporary and belonged exclusively to those who were witnesses of the resurrection of Christ, and were employed by him to found the Christian Church. The apostles were twice commissioned by their Master to go forth on their work of evangelization. First, during the third year of his public ministry. On this occasion, their labors were to be restricted to the Jews, properly so called.

Not even the Samaritans, though natives of Palestine, were to be the objects of their religious solicitude. They were earnestly

to seek out the lost sheep of the house of Israel. The second time was shortly before the Lord's ascension, when their sphere of labor was indefinitely extended. 'Go, and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost.' On the day of Pentecost, the apostles received miraculous gifts fitting them for their arduous work. And after evangelizing for some years in Palestine, they all departed, with the exception of St. James, into various quarters of the globe; but the region of their ministry seems to have principally comprised the civilized provinces and cities of the eastern part of the Roman empire—viz., Syria, Asia Minor, and Greece; though probably Peter, and after him Paul, visited Rome. There is no historical foundation for the tradition that the first apostles divided the then known world into twelve parts, each taking one of these for his special sphere of labor. This figment was very likely originated by two circumstances: 1. That the desciples were commanded to go into all the world and preach the gospel; and 2. That the desciples in point of fact had little personal intercourse with each other. Their zeal for the propagation of Chistianity left them no time to gratify their social inclinations. As a consequence, we have very imperfect accounts of their lives or manner of death.

The several apostles are usually represented in medieval pictures with special badges or attributes: St. Peter, with the keys; St. Paul, with a sword; St. Andrew, with a cross; St. James the Less, with a fuller's pole; St. John, with a cup and a winged serpent flying out of it; St. Bartholomew, with a knife; St. Philip, with a long staff, whose upper end is formed into a cross; St. Thomas, with a lance; St. Matthew, with a hatchet; St. Matthias, with a battle-ax; St. James the Greater, with a pilgrim's staff and a gourd-bottle; St. Simon, with a saw; and St. Jude, with a club.

APO'STLES' CREED. See CREED.

APOSTO'LIC, or APOSTO'LICAL, the general term applied to everything derived directly from, or bearing the character of the apostles. Either case constitutes apostolicity. The Roman Catholic Church declares itself the A. Church; the papal chair the A. chair, on the ground of an unbroken series of Roman bishops, from the chief apostle, Peter. The Church of England, in virtue of regular episcopal ordination from the pre-reformation church, claims to be the A.; so likewise do the Protestant Episcopal churches in Scotland and the United States. Apostolic Tradition (see TRADITION) claims to have been handed down from the apostles. In the same special sense, the name of A. Council belongs to that conclave of the apostles at Jerusalem (Acts, xv.), about the year 51 or 52 A.D., occasioned by the disputes raised at Antioch by Judaizing Christians as to the admission of uncircumcised Gentiles into the church. Certain congregations or churches, also, which were the special scenes of the labors of the apostles, bore for centuries the title of A. Churches, more especially those of Jerusalem, Antioch, Ephesus, Corinth, and Rome. But with the ever-increasing spiritual power of the Romish hierarchy, the name A. came to be more and more exclusively applied to Rome, and is retained by her, despite the energetic protests of the Protestant Churches. Hence the term Apostolic See, i.e., the see of Rome; Apostolic Blessing, the blessing of the pope as the successor of St. Peter; Apostolic Vicar, the cardinal who represents the pope in extraordinary missions; Apostolic Chamber, a council intrusted with the care of the revenues of the see of Rome; Apostolic Months—January, March, May, July, September, November—the months in which the pope, according to the Vienna Concordat of 1448, took possession of the vacant benefices in Germany, &c. A papal brief or letter is styled A. in the same sense.

APOSTO'LIC BRETHREN, or APOSTOLICI, the name given in Italy, towards the end of the 13th c., to one of those sects which, animated by the spirit of an Arnold of Brescia, felt constrained to oppose the worldly tendencies of the church. Its founder was Gerhard Segarelli, a weaver in Parma. Rejected, from some cause or other, by the Franciscan order, his long-continued and enthusiastic meditations led him to the profound conviction that it was above all things necessary to return to the simple forms of apostolic life. Accordingly, he went about (1260) in the garb of the apostles, as a preacher of repentance, and by his practical discourses gathered many adherents into a kind of free society, bound by no oaths.

At first he managed to avoid any direct collision with the dogmas of the church; but after twenty years of undisturbed activity and growing influence, Segarelli was arrested by the Bishop of Parma; and in 1286, upon the occasion of his release, Pope Honorius IV. renewed a decree of Pope Gregory X. against all religious communities not directly sanctioned by the papal chair. In 1290, Nicholas IV. setting himself expressly to oppose the A. B., they, on their side, began avowedly to denounce the papacy, and its corrupt and worldly church, as the Babylon of the Apocalypse. In 1300, many, both men and women, and among them Segarelli, as having, after abjuration, relapsed into heresy, perished at the stake. But his cause survived him. Dolcino, a more energetic and cultivated man, brought up as a priest, who had previously taken an active part in the Tyrol against the corruption of the church, now headed the orphan sect in Italy. He taught the duty of a complete renunciation of all worldly ties, of property and settled abode, &c. Having retreated into Dalmatia, he announced from thence the dawning of a new era, and in 1304, reappeared in Upper Italy, with thousands of adherents, as the enemy of the papacy—at that time humbled and impoverished by France. In 1305, a crusade was preached against him. He fortified the mountain Zebello in the diocese of Vercelli, but was, after a gallant defence, compelled by famine to submit. After horrible tortures, which he bore with the utmost fortitude, he was burned. In Lombardy and the south of France, remnants of the A. B. lingered on till 1368. See Krone, *Fra Dolcino und die Patarener*. (Leipsic, 1844.)

APOSTO'LIC CATHOLICS. See IRVINGITES.

APOSTO'LIC FATHERS, the name given to the immediate disciples and fellow-laborers of the apostles, and, in a more restricted sense, to those among them who have left writings behind them. The A. F., specially so called, are Barnabas, Clement of Rome, Ignatius of Antioch, and Polycarp of Smyrna. It is uncertain whether Papias of Hierapolis, and the author of the *Shepherd*, were really disciples of the apostles. The writings of the A. F., as to their form and subject, may be looked upon as a continuation of the apostolic epistles, though far inferior to them in spirit. Their main purpose is to exhort to faith and holiness before Christ's coming again.—Editions of the A. F. were published by Cotelerius (Par. 1672), Jacobson (Oxford, 1838), Hefele (1839), and Dressel (1857); another by Zahn, Gebhardt, and others began to appear in 1875. There are several English translations, including one in Dr. Donaldson's *Ante-Nicene Library*, vol i. (1867).

APOSTO'LIC MAJESTY, a title held by the kings of Hungary, was conferred by Pope Sylvester II., in 1000 A.D., upon Duke Stephen of Hungary, who had not only much encouraged the progress of Christianity in Hungary, but actually preached himself, in imitation of the apostles. In 1758, the title was renewed by Pope Clement XIII., in favor of Maria Theresa as Queen of Hungary, and continues to be used by the emperor of Austria as king of Hungary.

APOSTO'LIC CANONS AND CONSTITUTIONS, both ascribed by tradition to Clemens Romanus, are notes of ecclesiastical customs held to be apostolical, written in the form of apostolic precepts. *Constitutiones Apostolicæ*, consisting of eight books, were probably composed in Syria, and contain, in the first six books, a comprehensive rule for the whole of Christian life. These were probably written about the end of the 3d c.; while the seventh book, which is essentially an abridgment of them, may have belonged to the beginning of the 4th c. The eighth book was put together in the middle of the 4th c., for the use of the priests, and only relates to the sacred offices. Interpolations, however, were afterwards introduced. *Canones Apostolici*, which were also recognized by the church, were composed at a later period. The first fifty, compiled in the middle of the 5th c., and translated from the Greek into Latin by Dionysius the Younger, were acknowledged by the Latin Church alone. The Greek Church, on the other hand, accepted the thirty-five canons put forth in the beginning of the 6th c.; and this became a point of discord between the churches. Both collections were probably looked upon at first as apostolic traditions merely. Later, it came to be believed that they were written down by the apostles themselves, it being thought probable that they should have expressed themselves positively about the constitution as well as the dogmas of the Church.

APOSTO'LIC PARTY, the name given to a party who acted a conspicuous part in the modern history of Spain. They were composed of ardent Catholics, who were also absolutists so far as the king consented to be their instrument. They formed themselves (soon after the revolution of 1819) into an A. P., whose leaders were fugitive priests, and whose troops were smugglers and robbers. After taking an active part in all the subsequent agitations, they finally merged (1830) in the Carlist party.

APOSTO'LICAL SUCCESSION is a phrase used to denote one or both of *two* things—the derivation of holy orders by an unbroken chain of transmission from the apostles, and the succession of a ministry so ordained to the powers and privileges of the apostles. The former is necessarily a matter of fact, to be ascertained by history; the latter is rather a matter of opinion—the Roman and Protestant Churches, and again individuals and parties in either, differing widely from each other in their views. See BISHOP and ORDINATION.

APO'STROPHE (Gr. *apostrophe*, a turning away, or breaking off) is a rhetorical figure by which a speaker changes the course of his speech, and addresses, with greater or lesser emotional emphasis, persons present or absent, the dead, or inanimate objects, either to invoke them as witnesses, or to pity, praise, or blame

them. When the figure is well managed, it has a thrilling effect, both in oratory and poetry; but when extravagantly introduced, it becomes ludicrous. Examples of it abound in the writings and speeches of the great poets and statesmen both of ancient and modern times.—A. in grammar, is the omission of a letter or letters in a word, the omission being marked by a comma, as *'tis* for *it is;* the comma so employed is also called an *A.*

APO'THECARY, the name formerly given in England and Ireland to members of an inferior branch of the medical profession. The A. was in England a licentiate of the Apothecaries' Society of London; in Ireland, a licentiate of the Apothecaries' Hall of Ireland. Up to a comparatively recent period, however, no inconsiderable proportion of those who practised as apothecaries, at any rate in England, were persons practising without any license. The A. frequently kept a shop in which he sold drugs and made up medical prescriptions, in this respect competing with the chemist and druggist. But he was entitled to attend sick persons, and prescribe for them; and though it was the almost universal practice of apothecaries to charge their patients only for medicines supplied, they had the choice between doing this and charging for their attendances. They could not charge for both. This was held by Chief-justice Best, in an action by an A., who sought to recover on both grounds (see Wilcock, *On the Medical Profession*).

In having this choice as to their mode of charging, they had the advantage of the chemists and druggists; but the chief advantage they had over these lay in the recognition, by the law, of their right to practice, and their consequent immunity from punishment for the results of malpractice, except where they had shown gross ignorance. The Medical Act of 1858, which greatly altered the conditions of medical practice throughout the United Kingdom has much improved the status of licentiates of the Apothecaries' Societies; and though such licentiates are still entitled to keep shops for the sale of drugs, and to make up their own prescriptions, the passing of the Pharmacy Act (1868) has made broader the distinction between them and the class of chemists and druggists (see CHEMISTS AND DRUGGISTS). The term A. has been long in disuse, though, no doubt, it is still a legal description for licentiates of the Apothecaries' Society of London, or of the Apothecaries' Hall of Ireland; and such licentiates are now, as licentiates in medicine before the law, in all respects, including eligibility for public appointments, on a par with the graduates of universities. Under the Medical Act of 1858, they are entitled to be registered as licentiates in medicine, and, when registered, they have the right of practising medicine in all parts of the Queen's dominions, charging both for their visits and professional advice, and for medicines or medical appliances supplied by them. It is possible, indeed, that they have one advantage over medical men practising on other qualifications; for it has been repeatedly held by county court judges in England that they are the only medical practitioners entitled to recover the price of medicines supplied to patients.

But this question has never been brought before the superior courts in England, and the decisions referred to seem not to be supported by the language of the Medical Act. The conditions of getting the licenses of the Apothecaries' Society and of the Apothecaries' Hall in Ireland are nearly the same as those imposed by other corporations which grant medical qualification, the only difference worth mentioning being, that an apprenticeship to a licentiate for five years in England, for three years in Ireland, is indispensable for the apothecaries' license. The requirement of an apprenticeship put the Apothecaries' Society and the Apothecaries' Hall of Ireland at a disadvantage compared with the Colleges of Physicians which grant licenses to practise medicine; it also made it impossible for them to combine with surgical corporations in giving the double qualification in medicine and surgery on the result of a conjoint examination. Accordingly, the Act 37 and 38 Vict. c. 34, s. 2, in 1874 made the requirement of apprenticeship unnecessary. The Apothecaries' Society of London and the Apothecaries' Hall of Ireland each appoint a member of the General Council of Medical Education and Registration. The former is the first licensing corporation in the United Kingdom which granted a license to a woman to practise medicine; and the Act of 1874, which has been above referred to, saved their rights to admit women to certain examinations.

In England, the business or profession of an A., although not regulated, nor, indeed, fully recognized, till modern times, was the subject of several ancient statutes, and is traceable to a remote period. Richard Fitznigel, who died Bishop of London, is stated to have been A. to Henry II.; and it is an accredited tradition, that in 1345 King Edward III. gave a pension of sixpence a day to Coursus de Gangland, an A. in London, for taking care of, and attending his majesty during his illness in Scotland. It is, however, improbable that apothecaries were then common; indeed, it may be doubted whether at that time they existed as a publicly known body at all, for, in 1511, there was passed an act of parliament, the 3 Henry VIII. c. 11, for regulating the admission of persons practising physic or surgery, which makes no mention of the class now known as apothecaries. In 1543, however, the parliament passed a very curious act, the 34 and 35 Henry VIII. c. 8, the preamble of which deals severely with the ignorance and cupidity of the London surgeons; and which, as a remedy, provides for the toleration and protection of the irregular practitioners, who afterwards, as a body, acquired the distinctive name of apothecaries. This act, strange though it be in its language, may perhaps be regarded as the real foundation of the office of the A. It certainly shows on its face sufficient cause for its recognition of the persons to benefit whom it was passed, for it complains that the surgeons of London were not only unskilful and grasping, but that they 'have sued, troubled, and vexed divers honest persons, as well men as women, whom God had endued with the knowledge of the nature, kind, and operation of certain herbs, roots, and waters, and the using and ministering of them to such as had been pained with customable diseases, as women's breasts being sore, a pin and the web in the eye, uncomes of hands, burnings, scaldings, sore mouths, the stone, strangury, saucelim, and morphew, and such other like diseases; and yet the said persons have not taken anything for their pains or cunning, but have ministered the same to poor people only for neighborhood and God's sake, and of pity and charity.'

The act, therefore, proceeds to ordain, 'That at all time from henceforth it shall be lawful to every person being the king's subject, having knowledge and experience of the nature of herbs, roots, and waters, or of the operation of the same, by speculation or practice, within any part of the realm of England, or within any other the king's dominions, to practise, use, and minister in and to any outward sore, uncome, wound, apostermation, outward swelling or disease, any herb or herbs, ointments, baths pultess, and emplaisters, according to their cunning, experience, and knowledge in any of the diseases, sores, and maladies beforesaid, and all other like to the same, or drinks for the stone, strangury, or agues, without suit, vexation, trouble, penalty, or loss of their goods, the foresaid statute in the foresaid third year of the king's most gracious reign, or any other act, ordinance, or statute to the contrary heretofore made in anywise notwithstanding.'

Anciently, the apothecaries were not distinguishable from the grocers (the surgeons being, in like manner, undistinguishable from the barbers); indeed, it rather appears that apothecaries and grocers were synonymous terms; and it was not till 1617, in the 13th year of James I., that these bodies were formed into two distinct corporations by a charter from the king, which, reciting a previous grant to the grocers in 1606, by which the two bodies were expressly united, declares that the apothecaries shall, thenceforward, be separate from, and constitute a company distinct from the grocers. The privileges conferred by this charter upon the apothecaries were afterwards considerably enlarged by an act of parliament, 55 Geo. III. c. 194, to which we shall presently refer. But even after the charter of James, the London apothecaries appear to have been regarded merely as a trading company, occasionally prescribing the medicines which they sold, thus trespassing, as it was thought, on the province of the physician, until their right to do so was supported by a judgment of the House of Lords, in the case of the College of Physicians against Rose, reversing a previous decision of the Court of King's Bench. Rose, who was an A. and freeman of London, had attended one Seale a butcher, and made up and administered what was not denied to be proper medicine to him. This, it was contended, on behalf of the physicians, was an infringement of their exclusive privileges, and the King's Bench being of the same opinion, unanimously gave judgment for the plaintiffs; but the judgment was reversed by the House of Lords. So generally established had this branch of the medical profession become, that, in 1815, the act of parliament, 55 Geo. III. c. 194, to which we have already referred, was passed to provide for the sufficiency of their education; thus, for the first time, as it may be said, placing the apothecaries, as a body, on the footing of a liberal profession.

This statute, which completely regulates the position, privileges, and responsibilites of the apothecaries, after reciting (and for the most part confirming) the charter of James I., by which the apothecaries of London had been distinctively incorporated as a company, proceeds to enact that no person shall practise as an A., or act as an assistant to an A., in any part of England or Wales, unless he shall have been examined by a court of examiners (to be chosen by the master and wardens of the said company, in such manner as the act directs), and have received therefrom a certificate of his being duly qualified to practise as such. And with respect to what constitutes such practice as an A., it has been judicially determined that courts of law will look to section 5 of the act, which defines certain of the duties and liabilities of the office, but which in no way deprives apothecaries of any of their previously acquired privileges. The certificate—for which a sum is to be paid for the benefit of the company's funds—is not to be granted to any person below the age of twenty-one, though he needs now no apprenticeship of five years to an A., or who cannot produce testimonials of sufficient medical education and good

moral conduct; and any person practising without such certificate, is disabled from recovering his charges, and for every such offence is, moreover, liable to a penalty of £20, which can be recovered in the county court. It is also provided that—inasmuch as it is the duty of every A. to prepare, with exactness, such medicines that may be directed for the sick by any physician lawfully licensed—any A. refusing to compound or sell, or negligently compounding or selling any medicines as directed by any prescription or order, signed by any physician, lawfully licensed, with his initials, shall incur such penalties and forfeitures as therein set forth. And further, that the master, wardens, and society of apothecaries for the time being, or any persons by them appointed, and being not fewer than two, and properly qualified, may at all reasonable times in the daytime enter the shops of any A. throughout England and Wales, and search and examine whether the medicines and drugs be wholesome, and meet for the health of the subjects of the realm, and destroy such as they find to be otherwise; and report to the master and wardens of the society the names of the offenders, who are made liable to a fine of £5 for the first, £10 for the second, and £20 for the third offence. The act contains, however, a proviso that nothing therein shall affect the business of a chemist and druggist in the buying, preparing, compounding, dispensing, and vending drugs, medicines, and medicinal compounds, wholesale and retail; nor interfere with the rights of the universities of Cambridge or Oxford, the College of Physicians or of Surgeons, or the Society of Apothecaries, respectively, except as altered by that act.

This act, which was passed on the 12th of July, 1815, provides for the exemption from its operation of such apothecaries as might have been in practice on or before the first day of August of that year, and was amended by an act of 1874, chap. 34.

The apothecaries in Ireland are an exclusive corporation, whose privileges, equally with those of the Apothecaries' Company of London, are expressly saved by the Medical Act of 1858 (the 21 and 22 Vict. c. 90). Although occupying a position corresponding in many respects to that of the same body in England previous to 1858, the Irish apothecaries do not appear to have established their rights as medical practitioners to the extent to which the English apothecaries have succeeded.

The law relating to apothecaries in Ireland is contained in an act of the Irish parliament, the 31 Geo. III. c. 34, passed in 1791, which enacted that none should practice the art and mystery of an apothecary until after examination and certificate from the Apothecaries' Hall in Dublin. A great deficiency had long existed in Ireland of establishments and shops for the sale of medicines and compounding of prescriptions. It thus became necessary to form a Pharmaceutical Society in Ireland, and provide for the examination and registration of persons having competent practical knowledge of pharmaceutical and general chemistry. In 1875 an act called the Pharmacy Act (Ireland), 1875, 38 and 39 Vict. c. 57, was passed, creating the Pharmaceutical Society of Ireland as a body corporate with a first council, and defining qualifications for their successors. By that act all future duly examined persons, and all the existing licentiates of Apothecaries' Hall, were entitled to be registered as pharmaceutical chemists. So much of the act 1791 as prohibited keeping of open shop by others than licentiates was repealed; but it is unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding poisons within the Act 33 and 34 Vict. c. 26, or medical prescriptions, unless registered as a pharmaceutical chemist, or a chemist and druggist, under this act of 1875, or to assume such names unless registered. Unqualified persons incur a penalty of £5; but licentiates of the Apothecaries' Hall, and others who have passed an examination in pharmacy, are excepted. Registration under the Act 1875 does not entitle to practise medicine or surgery. See CHEMISTS AND DRUGGISTS.

In Scotland, there never was a class of practitioners corresponding to the English apothecaries.

APOTHE'CIA. See LICHENS.

APOTHE'OSIS, deification, or the raising of a mortal to the rank of a god (Gr. *theos*). From the polytheistic point of view there is nothing monstrous in this idea; on the contrary, it is quite natural, and a necessary part of the system. Among heathens generally, and especially among the Romans, every departed spirit became a deity (see MANES); 'and as it was common for children to worship (privately) the manes of their fathers, so was it natural for divine honors to be *publicly* paid to a deceased emperor, who was regarded as the parent of his country.' (See SMITH'S *Dictionary of Greek and Roman Antiquities.*) At the *Consecratio*, as it was called, of a Roman emperor, the body was burnt on a funeral pile, and as the fire ascended, an eagle was let loose to mount into the sky, carrying, as was believed, the soul of the emperor from earth to heaven. Many medals are found with the word *consecratio* surrounding an altar, with fire on it, and an eagle rising into the air.

APPALA'CHIANS, the general appellation of the great mountain-system—called also the Alleghanies—which stretches from the interior of Maine to the borders of Alabama, its distance from the sea gradually ranging between about 100 miles in the north, and about 300 in the south. Speaking generally, this chain may be regarded as the parent of the Atlantic rivers of the United States on the one side, and on the other of the southern tributaries of the St. Lawrence, and of the eastern feeders of the Mississippi; it is not, however, the actual water-shed during its entire length, for it is crossed by the Connecticut, the Hudson, and the Delaware, just as the Himalayas are pierced by the Ganges, and the Andes by the Amazon. The chain, in fact, consists of several ranges generally parallel to each other, which, along with the intermediate valleys that occupy two-thirds of the breadth, form a belt 100 miles wide—its multiform character, however, developing itself only to the west and south of the Hudson. To take the chief ridges by name, and to begin from the north; the White Hills of New Hampshire present some of the loftiest elevations, Moosehillock and Washington being respectively 4636 and 6634 feet above the sea. Next in order, the Green Mountains, which, true to the name, almost cover Vermont attain, in Killington Peak, a height of 3924 feet; then come the Highlands, on the east of the Hudson, so striking an object to the voyagers on its waters; immediately beyond that river, again, we find the Catskill Mountains, which, though of inconsiderable length, contain two eminences—Round Top and High Peak—respectively of 3804 and 3718 feet; while, on a terrace of another member of the group, Mountain House, a favorite refuge from the heats of summer, is perched 2500 feet above the level of the Hudson. Proceeding onwards, the Kittatinnies extend from the north of New Jersey as far as Virginia; while nearer to the sea, the Blue Ridge, stretching from about the same parallel down to North Carolina, is crowned, within the limits of Virginia, by the Peaks of Otter, 4000 feet high. In North Carolina are the Black Mountains, with the highest summit of the system, Black Dome, 6760 feet in height. Lastly, there lie, more to the westward, the Alleghanies proper in Pennsylvania and Virginia, and the Cumberland Mountains on the east border of Kentucky and Tennessee.

Of all these elevations not one at all approaches the limit of perpetual snow. Yet France, while struggling with England in North America, regarded the A. as a wall that was physically to exclude her rival from the basins of the St. Lawrence and the Mississippi. Anglo-Saxon energy, however, has virtually leveled the supposed barrier from end to end. Through Maine, New Hampshire, and Vermont runs a railway from Portland to Canada; by canal or by railway, or even by both abreast, New York has reached the waters of the St. Lawrence on at least four principal points between Montreal in the east, and Buffalo in the west; Pennsylvania has carried to Pittsburg a railway of 248 miles from Harrisburg, and a canal of 312 miles from Columbia; while, with the necessary exception of little Delaware alone, the remaining states along the coast have each its iron-way through the A.

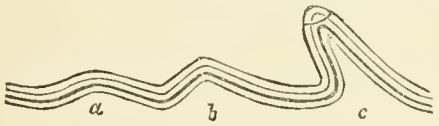
The chain abounds in coal and iron, those gifts of nature to industrious man, which in all ages have done so much for civilization, and which, in our own age, have, with the aid of steam, more than doubled all that they had done before; and it is a curious instance of the adaptation of the two worlds to each other, that, while the Spaniard met, in the south, the gigantic counterparts of the central plateau of his own romantic land, the Englishman, in the north, stumbled, as it were, on those same elements of almost creative energy which, within two centuries, were to be so instrumental in placing the daughter next to the mother among the nations of the earth. As an evidence of the actual value of the coal and iron of the A., Pennsylvania—where, hitherto, they have been chiefly found—has since 1840 made more rapid strides in growth of population than any other state in the Union, till between 1860 and 1870, when Illinois increased somewhat more rapidly. Nor are iron and coal the only valuable products of the A. To say nothing of the valleys—many of them as fertile as they are lovely—which separate the parallel ranges from each other, the mountains themselves yield limestone, marble, slate, building-stone, copper, zinc, chrome, &c.

Geology.—During the Azoic and Palæozoic periods of the earth's geological history, the district now occupied by the A. was a level plain. These mountains date their origin from a period subsequent to the Carboniferous epoch. The Coal measures are the newest upturned beds associated with the Appalachian range; and as the stratified rocks, with few exceptions, are laid down horizontally, these strata must owe their inclined position to the dislocating agency which elevated the mountains; they, consequently, supply a date anterior to its activity. At the base of the A., on their eastern side, there are a series of red sandstone beds, unconformable to the upturned strata, and occupying the valleys in their original horizontality, thus evidently unaffected by the disrupting agency which must have been active prior to their deposition. These beds have been referred by geologists to different

ages. That they are Old Red Sandstone, as conjectured by Maclure and others, is now universally denied. Hitchcock's supposition that they were Permian, is also considered as referring them to too remote a geological age. W. B. Rogers considered them first as members of the Triassic period; but has since, from evidence adduced from the contained organic remains, shown reason for relating them to the beginning of the Jurassic period. We thus obtain two grand limiting dates—the Carboniferous and Jurassic periods—within which the A. must have been formed. There are grounds for being even more specific, and referring the period of the dislocating agency to that immediately subsequent to the Carboniferous, represented in the stratified rocks of other districts by the Permian series; for the older upturned rocks had not only been ruptured and plicated, but also denuded into the various shapes they now present, before the horizontal rocks were deposited.

The late Professor H. D. Rogers, after years of persevering and devoted study, enunciated a theory of mountain formation based on his examination of the A., which not only explains their structure, but admits of a more or less complete application to the mountain systems of the world. The many proposed theories of mountain elevation are based upon assumptions which, unfortunately, are not true; but that is an unimportant matter to the majority of our speculating geologists, and one never seen by the inventors of the theories, who allowed themselves to be led captive by a poetic imagination, instead of building their inductions on field observations. Thus, to suppose that mountains are elevated by a wedge-like intrusion of melted matter, is to give to a fluid functions incompatible with its dynamic properties. So also the supposition that the igneous rocks were intruded as solid wedges, separating and lifting the crust, is opposed to the fact, that no apparent abrasion, but generally the closest adhesion, exists at the line of contact of the igneous and stratified rocks. Equally fatal objections can be adduced against the other theories. Professor Rogers observing that the A. were formed of a series of enormous waves, and comparing this appearance with other elevated districts, especially in Belgium and Britain, enunciated a theory of their structure, of which the following is a condensed view.

Disturbed strata have a wave-like arrangement, their dip being in curved, and never in strait planes; and in extensive areas the varying angles of dip exhibit one or more wide regular curves. These undulations are in the form of long parallel waves, their parallelism being in the line of the general trend of the part of the mountain system to which they belong. When different grades of magnitude, as regards length, height and amplitude, occur, the waves of the same grade are parallel, while the different grades are not necessarily so. The waves assume three different forms,



Appalachian Range.

which are characterized as—*Symmetrical flexures* (*a*), equally steep on the two slopes; *normal flexures* (*b*), having an excess of incurvation on the one side compared with the other; and *folded flexures* (*c*), or those with a doubling under of their more incurved slopes, and among which the steepest slopes are generally directed to the same quarters. These three forms, representing different gradations in the flexure, are regular in their succession in disturbed regions, the order being the same as in the diagram—that is, when we start from the most disturbed side, we go from the folded waves to the normal ones, and from these to the symmetrical; and in the same order, the waves, as they recede from the folded side, become progressively wider apart and flatter. Resting on these facts, Professor Rogers advanced his view of the structure of elevated regions in the following words:

'The wave-like structure of undulated belts of the earth's crust, is attributed to an actual pulsation in the fluid matter beneath the crust, propagated in the manner of great waves of translation from enormous ruptures occasioned by the tension of elastic matter. The forms of the waves, the close plication of the strata, and the permanent tracing of the flexures, are ascribed to the combination of an undulating and a tangential movement, accompanied by an injection of igneous veins and dikes into the rents occasioned by the bendings. This oscillation of the crust, producing an actual floating forward of the rocky part, has been, it is conceived, of the nature of that pulsation which attends all great earthquakes at the present day.'

This theory having originated as an explanation of the phenomena of the A., is easy of application to these mountains. They are composed of a series of parallel waves, having a general direction similar to the coast-line of the Atlantic Ocean. The line of maximum disturbance is on their eastern limits; consequently, the folded flexures, with the inversion of their steep sides, are chiefly confined to the great Appalachian valley, and the Atlantic slopes south of it. The flexures of this type impart a prevailing southeast dip to the whole outcrop; their number, and the excessive difficulty of detecting and continuously tracing them, frustrates every attempt at mapping them individually. The flexures of the second type, which curve more rapidly on the one side than on the other, prevail wherever the forces that disturbed the crust were neither excessively intense nor very feeble. It is the characteristic form everywhere between the great Appalachian valley and the Alleghany Mountains. It distinguishes not only those larger waves which separate the coal—containing strata east of the Susquehanna into special basins—but the minor undulations which throw the coal measures of these basins into groups of lesser saddles and troughs. Undulations of the first or symmetrical type occur beyond the Alleghany Mountains, where two groups of them may be distinguished: the one subdividing the bituminous coal-field, with its five very broad waves, into six successive basins; the other, composed of four equidistant and very straight undulations, traversing parts of Cambria, Indiana, Somerset, and Fayette counties.

The strata thus elevated, and forming the A., belong entirely to the oldest or Palæozoic division of the fossiliferous rocks. Metamorphic rocks, consisting of felspathic, hornblendic, and micaceous gneiss, and mica-slate, exist on the eastern base of these mountains, but have not been noticed as forming part of the plicated strata of the A. Extensive formations of talcose and micaceous slates, indurated clay-slates, and chloritic and steatitic slates, exist in the more disturbed districts. These are highly metamorphosed members of the older fossiliferous, and must not be confounded with, though they so much resemble, the azoic metamorphic rocks.

The Palæozoic rocks constitute a vast succession of fossiliferous strata, commencing with the lowest deposits resting on the Metamorphic rocks, and terminating with the highest of the Coal strata. Their aggregate thickness, as measured in Pennsylvania, amounts to 35,000 feet. While exhibiting a remarkable variety of mineral character, they may be classed under the three great divisions of sedimentary rocks—viz., sandstones, slates, and limestones. Intercalated with them, as subordinate layers, there occur deposits of coal, chert, and iron ore. They are all more or less fossiliferous.

Coal Measures.—The character of the rocks of the Appalachian district of North America indicates that during the Carboniferous epoch an immense continent existed on the present site of the Atlantic, which supplied materials for the sandstone and slate. It seems to have had an extensive shallow marshy shore, of such a character as to be able to support the vegetation, which has become, in the course of ages, converted into coal. The coal-fields to the far west of the A., in Michigan, Indiana, Illinois, and Missouri, have been connected with the Appalachian coal formation, which includes all the detached basins, both anthracite and semi-bituminous of the mountain chain of Pennsylvania, Maryland, and Virginia, and also the vast bituminous trough lying to the north-west in Pennsylvania, Ohio, Virginia, Kentucky, Tennessee, and Alabama.

On the eastern slope of the A., the coal, from its proximity to the region of greatest disturbance, has lost nearly all its volatile constituents, and is converted into anthracite (q.v.). In the troughs to the westward of the Appalachian valley, where the forces that disturbed the crust were not so intense, the coal has not parted with such a large proportion of volatile matter, but is so much altered as to be characterized as semi-anthracite. Both the anthracite and semi-anthracite are mined for economical purposes, but their extent as well as their value is of little importance compared with the enormous Appalachian bituminous coal-field. From Northern Pennsylvania to middle Alabama, its length is about 875 miles, and its greatest breadth between Southern Pennsylvania and Northern Ohio is about 180 miles; it covers an area of about 56,000 square miles, and is almost the largest expanse of coal measures in the world. A single coal-seam in this field has been traced over an extent of country 225 miles long by 100 broad, showing a superficial area of 14,000 square miles. The actual depth of workable seams in the deepest part of this basin is estimated at 40 feet; but when the amount of denudation of the upper measures over large districts is taken into account, the average depth of the entire field cannot be more than 25 feet. Taking this as the thickness, the amount of coal in this great coal-field would be 1,387,500,000,000 tons. When this is compared with the estimated quantity of coal in the British coal-fields, viz., 190,000,000,000 tons, some conception may be formed of the enormous extent of coal existing in this district of North America.

Metals.—Extensive beds of magnetic, hematitic, and fossiliferous iron ores occur in many of the formations of the A., from the lowest metamorphic gneiss to the highest coal-measures. Iron ore is extensively wrought in Pennsylvania and Ohio, large quantities of the anthracite being used in the smelting furnaces. Veins of lead occur in the Metamorphic rocks, rarely stretching up into the red slate. In the Palæozoic beds, veins of copper and nickel occur in sufficient quantity to be wrought.

APPALACHICO'LA, a river of the United States, rising in Georgia, and flowing through Florida into the Gulf of Mexico, or rather into a bay that bears its own name. Reckoning from its remotest sources, the head waters of the Chatahooche, the A. is about 400 miles long, being navigable for boats throughout nearly its entire course. It is, however, only at the junction of the Chatahooche with the Flint that the name of A. is applied to the stream; and up to this point, a stretch of about 70 miles, there is a sufficient depth of water for steam-navigation; while the tides also ascend for about two-thirds of the distance.—A. is also a seaport at the mouth of the stream above mentioned. Here is shipped the produce of the river-basin, consisting chiefly of large quantities of cotton.

APPA'RENT. This term is used to express a number of important distinctions, especially in astronomy. The *A. magnitude* of a heavenly body is the angle formed by two lines drawn from the ends of its diameter to the spectator's eye; this obviously depends upon the distance of the body, as well as upon its real magnitude. A planet seen from the surface of the earth seems lower than if seen from the center of the earth—the former is its *A. altitude*, the latter its real. *A. noon* is when the sun is on the meridian; true or mean noon is the time when the sun would be on the meridian if his motion in the heavens were uniform and parallel to the equator. See EQUATION OF TIME. The daily and annual motions of the sun in the heavens are both *A. motions*, caused by two real motions of the earth.

APPARITIONS. The belief that the spirits of the departed are occasionally presented to the sight of the living, has existed in all ages and countries, and usually declines only when a people have advanced considerably in the knowledge of physical conditions and laws. Not that A. then cease to be reported—for this is far from being the case—but that the more intelligent part of the community are then usually able to explain away the alleged occurrence in some way satisfactory to themselves, not involving the admission of a possible projection of a spirit upon the living sense.

Nothing is more certain than that there are conditions of the body when spectral appearances, such as occur to us in uneasy dreams, become sensible to the waking vision. One of these conditions is that of the patient under the disease of *delirium tremens*, who not only hears ideal enemies plotting against his life in adjacent rooms or behind hedges, but thinks he sees them preparing to do him mischief, and has been known to jump overboard of a vessel into the sea, in order to escape the apprehended danger. In such excitements it is, though arising from different causes, that an intending murderer thinks he hears the prince of fallen angels tempting him on to crime, or sees before him a 'dagger of the mind' wherewith to end the life of his victim. There are also instances of spectral illusions traceable to a simply disordered state of the digestive organs. M. Nicolai, an eminent bookseller in Berlin, fell, in the early part of the year 1791, into a depression of spirits, and in that condition neglected a course of periodical bleeding which he had been accustomed to observe. The consequence was his becoming liable for some months to seeing trains of phantasmata or spectral figures, which moved and acted before him, nay, even spoke to, and addressed him. He was fortunately able, not merely to coolly observe the phenomena, but to describe them in an ample paper which he presented to the Philosophical Society of Berlin. This case may be said to have formed the basis of a theory of A., advanced by Dr. Ferrier, Dr. Hibbert, and others, amounting merely to this, that they are all to be accounted for by peculiar conditions of the organism of the individual sensible of them.

There is certainly a large class of cases which fall readily under this explanation; but, if we are to accept the whole that have been, on more or less good authority, reported, it must be admitted that a theory of a more comprehensive nature is still required in order to satisfy the duly cautious inquirer.

Let us take, for instance, an apparition story which Dr. Hibbert owns to be one of the best authenticated on record. It was thus written down in 1662 by the Bishop of Gloucester, from the recital of the young lady's father: 'Sir Charles Lee, by his first lady, had only one daughter, of which she died in childbirth; and when she was dead, her sister, the Lady Everard, desired to have the education of the child; and she was by her very well educated, till she was marriageable, and a match was concluded for her with Sir William Perkins, but was then prevented in an extraordinary manner. Upon a Thursday night, she thinking she saw a light in her chamber after she was in bed, knocked for her maid, who presently came to her, and she asked why she left a candle burning in her chamber. The maid said she left none, and there was none but what she had brought with her at that time. Then she said it was the fire; but that, her maid told her, was quite out; and she said she believed it was only a dream; whereupon she said it might be so, and composed herself again to sleep. But about two of the clock she was awakened again, and saw the apparition of a little woman between her curtain and her pillow, who told her she was her mother, that she was happy, and that by twelve of the clock that day she should be with her.

Whereupon she knocked again for her maid, called for her clothes, and when she was dressed, went into her closet, and came not out again till nine, and then brought out with her a letter, sealed, to her father: brought it to her aunt, the Lady Everard, told her what had happened, and desired that as soon as she was dead, that it might be sent to him. The lady thought she was suddenly fallen mad, and thereupon sent suddenly away to Chelmsford for a physician and surgeon, who both came immediately; but the physician could discern no indication of what the lady imagined, or of any indisposition of her body; notwithstanding the lady would needs have her let blood, which was done accordingly. And when the young woman had patiently let them do what they would with her, she desired that the chaplain might be called to read prayers; and when prayers were ended, she took her guitar and psalm-book, and sat down upon a chair without arms, and played and sung so melodiously and admirably, that her music-master, who was then there, admired at it. And near the stroke of twelve, she rose and sate herself down in a great chair with arms, and presently fetching a strong breathing or two, immediately expired, and was so suddenly cold, as was much wondered at by the physician and surgeon. She died at Waltham in Essex, three miles from Chelmsford, and the letter was sent to Sir Charles at his house in Warwickshire, but he was so afflicted with the death of his daughter, that he came not till she was buried; but when he came, he caused her to be taken up, and to be buried with her mother at Edmonton, as she desired in her letter.'

Dr. Hibbert, in treating of this case, concludes that the young lady was consumptive and about to die, and in this diseased frame of body became the subject of an illusion; but these are assumptions directly contrary to what the record bears, and there is, after all, the singular circumstance to be accounted for, the young lady's death occurred exactly at the time predicted. To a similar purport is the case of the wife of Dr. Donne, related by Izaak Walton. Donne left his wife pregnant in London, and went with Sir Robert Drury to Paris. Two days after arriving there, he stated to Drury that he had had a vision of his wife walking through his room, with her hair hanging over her shoulders, and a dead child in her arms. So impressed were they by the incident that they immediately sent a messenger to London to inquire regarding Mrs. Donne's health. The intelligence brought by the man was, that she had been brought to bed of a dead child at the hour her husband thought he had seen her in Paris. In this case, too, if the requisite disordered state of Dr. Donne were granted, the coincidence of the distant event in its particulars, and in point of time, would remain unaccounted for by Dr. Hibbert's theory.

That there is an abundance of such cases reported, will not be disputed. In what direction speculation regarding them is to move, if the insufficiency of Dr. Hibbert's theory be acknowledged, will probably depend on the general tendency of the movements of science. If psychological study were more in repute, and the phenomena of dreaming in particular were diligently examined, there might be a hope of a satisfactory theory of what are called *A.* ere the world was many years older.

APPEA'L is the right or process of bringing under the notice of a higher court the judgment of a lower court which the appellant represents as erroneous in fact or law. Formerly, this right was a valuable guarantee against political oppression and private extortion: for example, the A. to royal judges from the courts of feudal barons. Now, the object of A. is to secure uniformity in the administration of justice. This is effected not merely by the reversal of erroneous judgments which are appealed, but by the knowledge, which every judge has, of precedents in the Supreme Court, and that his own judgments are subject to A. The most important questions connected with the modern system of A. are: 1. Whether in all cases, of whatever pecuniary value, A. is allowed, and also whether at all stages, or only after final judgment; 2 On what conditions as regards time, *interim* execution, and security for costs, A. is allowed; 3. The relative constitution of the lower and higher courts.

In the civil law, the earliest form of A. was the *provocatio* from the judgment of a criminal court to the Roman people. This fell into disuse under the *Quæstiones Perpetuæ*. The *appellatio* was a veto or interdict granted upon the *intercessio* of one complaining of a judicial act. The subordination of judges increased largely under the empire, and for some time the emperor, who was tribune for life and also proconsul, was the only final court of A. Latterly, the senate and the prætorian prefects also gave final decisions. Only six months were given for A. from the most distant provinces. The law is stated in detail in the Digest, Lib. XLIX.

In the Christian Church, under the judicial system defined in the False Decreatals, frivolous appeals direct to the Roman Consistory multiplied enormously. The remonstrances of St. Bernard were gradually given effect to by the Lateran and Basel Councils, and wholesome restrictions on the right of A., and in favor of the independence of Cisalpine church courts, passed into most modern

concordats (Fleury, *Inst. du Droit Eccles.*, iv. 23; Lancelot, *Inst. du Droit Canon*, iii. 17). The famous *appel comme d'abus* in France was originally an A. to civil justice against the encroachments of church jurisdiction. Enough has been said to show how closely the question of A. is connected with the great problems of political history—national independence, the relations of central and provincial authorities, &c.

In English law, prior to the Judicature Acts, 1873 and 1875, the word A. was not commonly used. In common law courts, there was a proceeding in 'error' by 'assignment of errors' and 'joinder of errors.' The old 'writ of error' and 'writ of false judgment' are still sometimes used in bringing up the proceedings of certain inferior courts. In Chancery, the A. was formerly called 're-hearing,' the Vice-chancellor being regarded as the delegate of the Lord Chancellor. Under the modern system of 'fusion,' every judgment in the High Court of Justice (except a judgment of the Court of Probate where leave is required) may by simple motion be submitted to the Court of A., to have reversed, discharged, or varied. Interlocutory proceedings in chambers may also be appealed to a judge in chambers; and from him A. lies to the Divisional Court. In the Chancery Division, the judge has the discretion of directing the matter to be argued before him in court, or allowing A. direct to the Court of A. The A. from the London Bankruptcy Court is also to the Court of A. An A. in Divorce requires in many cases to be the full 'court,' not to the ordinary Court of A. This last court consists practically of six Lords Justices of A., sitting in two divisions; one for Common Law A.; the other for Chancery, Probate, Admiralty, and Bankruptcy A. The courts it superseded were: 1. In Chancery, the Lord Chancellor and Lords Justices; 2. At Common Law, the Court of Exchequer Chamber, consisting of the two Common Law Courts whose judgment was not under A. In 1873, it was proposed to abolish the A. to the House of Lords, but now in all cases a petition of A. may be brought from the judgments of the Court of A. (Appellate Jurisdiction Act, 1876, and Standing Orders, May 1878). In most cases, an A. to the Privy-council from an Indian or colonial court requires leave from the court below or the Judicial Committee.

As regards A. from the inferior courts in England, an A. lies from the county court to a divisional court of the High Court of Justice, if the judgment has been pronounced in the ordinary or Admiralty jurisdiction of the county court, but to the London Bankruptcy Court, if the judgment has been pronounced in the bankruptcy jurisdiction of the county court. All determinations in law by justices of the peace (including metropolitan police and stipendary magistrates) may be brought up on a case stated under 20 and 21 Vict. c. 43 for the opinion of a divisional court of the High Court of Justice. As to appeals in Ecclesiastical causes, see Phillimore, *Eccl. Law*, p. 1264.

Questions of law arising on the trial of a person convicted of treason, felony, or misdemeanor (e. g., at the Central Criminal Court, the assizes or quarter sessions), may be reserved by the judge or justice trying the case for the consideration of the Court for Crown Cases Reserved, established by the Act 11 and 12 Vict. c. 78. This court must consist of at least five judges of the High Court of Justice.

The law of A. in Ireland is practically the same as in England.

In Scotland, in the Court of Session the judgments of the Lords Ordinary sitting in the Outer House are appealed by a reclaiming note to the First or Second Division of the Inner House. The opinion of four judges is thus obtained on the opinion of one judge. These appeals are discouraged, except after final judgment by the Lord Ordinary, but they are competent at other stages, though in most cases only with leave of the judge. From all final judgments of the Inner House there is an A. to the House of Lords within a period of one year. Where the judgment is not final, leave to A. must be got, unless there has been a difference of opinion among the judges. Pending an A., the Court of Session have absolute power to regulate *interim* possession of property or execution of a decree for money.

The Court of Session has exclusive jurisdiction as a Court of Review in *civil* causes over all inferior courts, even in cases where its original jurisdiction is excluded, unless there be an express exclusion of review by statute; and where A. is excluded, the Court of Session has jurisdiction to set aside their decisions, where they have acted in excess of their statutory jurisdiction. In the latter case, the technical remedy is generally by a note of suspension or an action of reduction. The normal A., however, from final judgment in the Sheriff Court is by Note of A. under the Court of Session Act, 1868, and this goes directly to the Inner House. Cases are often brought up before judgment in the Sheriff Court for jury trial in the Supreme Court. The Court of Session also hears appeals from the Registration of Voters Courts held by the sheriffs, from the valuation committees of the commissioners of supply, and from the magistrates in burghs, and as to excise duties from the justices at quarter sessions.

Within the Sheriff Court itself, the right of A. from the sheriff-substitute to the sheriff-principal is regulated by the Sheriff Court Acts, 1853 and 1876. Appeals from the Small Debt Court are confined to certain grounds mentioned in the Act 1 Vict. c. 41 (such as malice and oppression and defect of jurisdiction in the judge), and are made to the next Circuit Court of Justiciary.

At common law, the High Court of Justiciary may review the proceedings of all inferior courts in criminal matters, but not on the merits. This is mainly done by the remedies of advocation and suspension.

As regards summary prosecutions before magistrates, the right of A. consists of a case stated for the opinion of the High Court of Justiciary or the Court of Session, according to the criminal or civil nature of the prosecution. This is regulated by the Summary Prosecutions Appeals Act, 1875. Where a question of law arises on a criminal trial by jury, whether before the sheriff or at circuit, there is no right of A. to the High Court of Justiciary. The judge presiding at circuit occasionally 'certifies' a question of law as requiring discussion at the High Court, but he is not bound to do so. There is no A. from the High Court to the House of Lords, although this right was frequently claimed last century. Prior to the Union there was no A. from the High Court to Parliament.

APPENZE'LL (from *Abbatis Cella*), a canton in the north-east of Switzerland. Area, 162 square miles. Pop. (1876) 60,786. It is divided into two districts—Innerrhoden and Ausserrhoden, the former of which is peopled by Roman Catholics, the latter by Protestants, and noted for its dense population. The surface is mountainous, especially in the south, where Mont Sentis attains an elevation of 8232 feet. The chief river is the Sittern, which flows through the center of the canton. A. holds the 13th place in the Swiss confederacy; the constitution of each half of the canton is a pure democracy. The inhabitants are chiefly employed in agriculture, cattle-keeping, cotton manufactures, and embroidery. They are fond of dancing, music, and athletic exercises, and have the reputation of being first-rate marksmen.

Appenzell, the capital of the canton of the same name, is situated on the left bank of the Sittern, in lat. 47° 29′ N., and long. 9° 24′ E. Pop. (1870) 3686. The town is ill built, and has only a small trade in linens. The other towns are Trogen (with a pop. of 2912, and manufactures of linen and muslin), Herisau (pop. 9727), &c.

APPERLEY, Charles James, the 'Nimrod' of the *Quarterly Review*, is a writer who deserves mention, if not from the intrinsic importance of the subjects on which he exercised his pen, at least from the perfection he attained in the department to which he confined himself. He was the son of a Welsh country gentleman, and was born in Denbighshire in 1777. His education at Rugby stimulated his love of field-sports more than his love of the classics. At the age of 24, he married, and went to reside at Bilton Hall, in Warwickshire, where he devoted his energies as exclusively to the chase as the great Nimrod himself could have done. He hunted everywhere in Great Britain. In 1821, he began to contribute to the *Sporting Magazine*. His clever, gossiping articles were so much relished, that in two years that periodical doubled its circulation. The proprietor Mr. Pittman, was of course highly gratified. He remunerated Mr. A. handsomely, kept a stud of hunters for him, and paid the expenses of his sporting tours; but 'Nimrod' seems to have been of rather expensive habits, and to have occasionally required an advance of money from his employer. When Mr. Pittman died, his relatives entered into a lawsuit with the 'mighty hunter,' for the recovery of this money. Nimrod, however, prudently transferred himself to France, where he chiefly resided during the rest of his life. He died on the 19th of May 1843. His best writings are *The Chase, the Turf, and the Road*, which appeared in the *Quarterly Review* (1827).

APPERT, Benjamin Nicholas Marie, a French philanthropist, was born in Paris, September 10, 1797. He began his course in 1816 by introducing into several schools a system of mutual instruction, and, in 1820, founded and conducted gratuitously a school for the prisoners at Montaign. Being suspected of having aided the escape of two prisoners, he was himself confined in the prison of La Force, where he made good use of his opportunities of becoming acquainted with the moral and physical circumstances of prisoners. After his liberation, he prosecuted his benevolent plans with renewed zeal, and undertook a journey through the whole of France, in 1825, to inspect schools, prisons, hospitals, &c. The results were given in his Journal. After the July revolution, he was employed by Louis Philippe to superintend the measures taken for the relief of the indigent classes. In his travels, he visited Belgium, Prussia, Austria, Saxony, and Bavaria, and gave the results of his observations on the management of schools, hospitals, prisons, &c., in several works. He also wrote a work entitled *Dix Ans à la Cour du Roi Louis Philippe*, and, in his *Conférences contre le Système Cellulaire*, strongly opposed the system of solitary confinement. Though one-sided in some of his views, A. is a sincere, warm-hearted and practical philanthropist.

APPERT, FRANÇOIS, a French technologist, the inventor of a method of preserving meat, vegetables, and other articles of food without the use of salt or other chemical application. This method is fully described in his work *L'Art de Conserver toutes les Substances Animales et Végétales* (4th edition, Paris, 1831). See ANTISEPTICS.

A'PPETITE. See HUNGER and THIRST.

APPIA'NI, ANDREA, styled in his day 'the Painter of the Graces,' was born at Milan, May 23, 1754. His poverty compelled him to gain a subsistence by decorative painting; but in the course of his travels, he studied the works of great masters, and formed for himself an original style, almost rivaling that of Correggio. At Rome, he devoted his attention to the frescoes of Raphael, and made such progress, that he soon excelled all living artists in fresco-painting. The best evidences of his genius are found in the cupola of the church of *Sta. Maria di S. Celso* at Milan; and in the frescoes with which he decorated the villa of the Archduke Ferdinand in 1795. Napoleon I. appointed him court-painter. In return, he executed portraits of the French emperor and several of his generals. His most beautiful frescoes are the paintings on the ceilings of the palace of Milan, which consist of allegorical illustrations of Napoleon's career; and Apollo with the Muses in the Villa Bonaparte. Almost all the palaces in Italy contain frescoes by A. His finest oil-painting is Rinaldo in the garden of Armida. The fall of his patron, Napoleon I., left A. in indigent circumstances. He died November 8, 1817.

APPIA'NUS, a native of Alexandria, who flourished during the reigns of Trajan, Hadrian, and Antoninus Pius. He was author of a Roman history, in twenty-four books, of which only eleven are extant. It was not remarkable for anything except the plan on which it was written. Instead of proceeding to exhibit chronologically the growth of the empire, from its rude beginning on Palatine Hill to the period when its power held the whole world in awe, which is at once the popular and the philosophical method, he divided his work into ethnographic sections, recording separately the history of each nation up to the time of its conquest by the Romans. First in order were the books devoted to the old Italian tribes, and afterwards followed the history of Sicily, Spain, Hannibal's wars, Libya, Carthage, and Numidia, Macedonia, Greece Proper and its colonies, Syria, Parthia, the Mithridatic war, the civil wars, and the imperial wars in Illyria and Arabia. As a historian, A. is a mere compiler, and not very accurate in his compilation. His geographical knowledge, in particular, is singularly deficient, considering the age in which he lived. One specimen of his blunders will suffice: in his section on Spain, he states that it takes only half a day to sail from Spain to Britain. The edition of A. by Schweighaüser is highly esteemed, but the most complete is that in *Bibliothèque Grecque* of Firmin Didot.

A'PPIAN WAY (Lat. *Via Appia*), well named by an ancient writer *Regina Viarum* (the queen of roads), was formed, in part at least, by Appius Claudius Cæcus, while he was censor (313 B.C.). It is the oldest and most celebrated of all the Roman roads. It led from the *Porta Capena* at Rome in a southerly direction to Capua, passing through Three Taverns, Appii Forum, Terracina, &c. Subsequently, it was carried on to Beneventum, Tarentum, and thence to Brundusium. It had an admirable substructure or foundation, from which all the loose soil had been carefully removed. Above this were various strata cemented with lime; and, lastly, came the pavement, consisting of large hard hexagonal blocks of stone, composed principally of basaltic lava, and jointed together with great nicety, so as to appear one smooth mass. The remains of it are still visible, especially at Terracina. The cost must have been enormous, for the natural obstructions are great. Rocks had to be cut through, valleys filled up, ravines bridged, and swamps embanked.

A'PPIUS CLAU'DIUS CRASSUS, a Roman decemvir (451—449 B.C.). While the other decemviri were engaged in repelling an incursion made by the Sabines, A. C. and his colleague Oppius remained in Rome, with two legions to maintain their authority. Meanwhile, A. C. had been smitten by the beauty of Virginia, daughter of a respected plebeian named Lucius Virginius, who was abroad with the army. By force and stratagem, representing that she was the born slave of Marcus Claudius, one of his clients, A. C. gained possession of the maid. His design was penetrated by Icilius, who was betrothed to Virginia, and who, aided by Numitorius, her uncle, threatened to raise an insurrection against the decemviri. Virginius, hurriedly recalled from the army by his friends, appeared and claimed his daughter; but, after another mock-trial, she was again adjudged to be the property of Marcus Claudius. To save his daughter from dishonor, the unhappy father seized a knife and slew her. The popular indignation excited by the case was headed by the senators Valerius and Horatius, who hated the decemvirate. The army returned to Rome with Virginius, who had carried the news to them, and the decemviri were deposed. A. C. died in prison by his own hand (as Livy states), or was strangled by order of the tribunes; his colleague, Oppius, committed suicide; and Marcus Claudius was banished. The *Claudia Gens* (see GENS) was one of the most numerous and important of the patrician tribes or clans of Rome; and besides the sons and grandsons of the decemvir, there were numerous persons of distinction who bore the name of Appius.

A'PPLE (*Pyrus malus*. For the generic character, see PYRUS). This well-known fruit has been very long cultivated, and by that means it has been very much improved. It was extensively cultivated by the Romans, by whom, probably, it was introduced into Britain. The wild A., or CRAB-tree, a native of Britain, and very generally found in temperate climates of the northern hemisphere, is a rather small and often somewhat stunted-looking tree, with austere, uneatable fruit, yet it is the parent of all, or almost all the varieties of apple so much prized for the dessert.

The A.-tree, even in a cultivated state, is seldom more than 30—40 feet high. It has a large round head; the leaves are broadly ovate, much longer than the petioles, woolly beneath, acute, crenate, and provided with glands; its flowers are always produced, 3—6 together, in sessile umbels, and are large, white, rose-colored externally, and fragrant. The fruit is roundish, or narrowest towards the apex, with a depression at each end, generally green, but also frequently yellow, light red, dark red, streaked, sometimes even almost black, with the rind sometimes downy, sometimes glabrous, sometimes thickish, and sometimes very thin and transparent, varying in size from that of a walnut to that of a small child's head—the taste more or less aromatic, sweet, or subacid. It is produced on spurs, which spring from branchlets of two or more years growth, and continue to bear for a series of years. The fruit of the A. is, with regard to its structure, styled by botanists a *pome* (q. v.). The eatable part is what is botanically termed the *mesocarp* (see FRUIT), which, in its first development, enlarges with the calyx, the summit of the fruit being crowned at last by the dried 5-parted limb of the calyx; the *endocarp* being, when ripe, cartilaginous, and containing in its cells seeds which do not correspond with them in size, but are so free as often to rattle when it is shaken.

The A. is now one of the most widely diffused of fruit-trees, and in the estimation of many is the most valuable of all. It succeeds best in the colder parts of the temperate zone. It is, however, to be met with on the coasts of the Mediterranean Sea, in Arabia, Persia, the West Indies, &c., but there its fruit is small and worthless as in high northern latitudes. The varieties in cultivation are extremely numerous. They have been classified

Apple-blossom.

with great care by recent German writers, by whom the classification and description of apples, pears, and similar fruits, has been treated as a sort of science, and dignified by the name of Pomology. Metzger, in his description of the pomaceous fruits of Southern Germany, describes 89 different kinds of A., all of which are constant, besides sub-varieties. New varieties are continually produced; and as they are chiefly preserved and propagated by grafting—although some of them also grow by layers and cuttings—the old ones gradually die out. The *costard*, from which dealers in apples received the name of costard-mongers, is no longer known. Many varieties are designated by the general names of *Pippins*, *Rennets*, *Codlins*, and *Calvilles*. Some kinds, not approved for the desert, are in high esteem as baking apples, and others still more acid or austere are preferred for the manufacture of CIDER (q. v.).

The A. is grown in Britain either as a standard, an espalier, or a wall-tree, and is variously trained. It is usually grafted on A. or crab-stocks, but succeeds also on hawthorn-stocks, and is in this way sometimes introduced into hedges. A very dwarf variety, called the *Paradise A.*, is often used as a stock on which to graft in order to produce dwarf-trees; and trees thus dwarfed are often very productive when little larger than current or gooseberry bushes. Some of the varieties of A. are more hardy than others,

and are therefore to be preferred for cold or exposed situations. Some of the finest kinds succeed well only when the soil and climate are good. Some kinds are much earlier than others, both in flowering and ripening.

The wood of the A.-tree is hard, durable, and fine-grained. The crab is often planted both as an ornamental tree and for the sake of its wood. The bark contains a yellow dye.—As a fruit tree, the A. requires a fertile soil and sheltered situation. The various uses of the fruit—for the dessert, for baking, preserving, making jelly, &c., as well as for making the fermented liquor called cider—are sufficiently well known. Vinegar is also made from it; and sometimes a kind of spirit, especially in Switzerland and Swabia. It contains *Malic acid*, which is extracted for medicinal purposes.—The fermented juice of the Crab A. is called *Verjuice*. It is used in cookery, and sometimes medicinally; also for the purifying of wax. Apples are an important article of commerce. Great quantities are imported into Britain, chiefly from France, Canada, and the northern parts of the United States. The A. *keeps* better than most kinds of fruit.

Beaufins or *Biffins* are apples slowly dried in bakers' ovens, and occasionally pressed till they become soft and flat. They are prepared in great quantities in Norfolk.

The SIBERIAN CRAB is perhaps the parent, by hybridization or otherwise, of some of the varieties of A. now in cultivation. Two species partake this designation, both natives of Siberia, and frequent in gardens in Britain, *Pyrus baccata* of Linnæus, and *Pyrus prunifolia* of Willdenow, which, however, scarcely differ, except that in the former the sepals (leaves of the calyx) are deciduous, in the latter they are persistent—a circumstance of very doubtful importance as a specific distinction. The fruit is sub-globose, yellowish, and rather austere, but is good for baking and preserves.

The AMERICAN CRAB or SWEET-SCENTED CRAB (*P. coronaria*) is a native of North America, especially of the southern part of the Alleghanies. It is a small tree with broad leaves and white flowers, becoming purple before they drop off, and which have a powerful smell, resembling that of violets. The fruit is flatly orbicular, of a deep green color, and sweet scented. It is very acid, but is made into cider, and also into preserves. *P. angustifolia*, a native of Carolina, much resembles this, but has much narrower leaves and smaller fruit.

The CHINESE CRAB (*P. spectabilis*) is a small tree, a native of China. It is very ornamental when in flower; the flowers being in sessile, many-flowered umbels, and of a bright rose-color. The fruit is irregularly round, about the size of a cherry, yellow, and fit to be eaten, like the medlar, only when in a state of incipient decay.

A'PPLE OF SODOM. See SOLANUM.

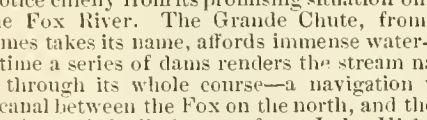
A'PPLEBERRY. See BILLARDIERA.

A'PPLEBY, the county town of Westmoreland, lies in lat. 54° 35′ N., long. 2° 28′ W. It is in the north of the county, on the river Eden, which flows past Carlisle into the Solway Firth. A. has two parishes, one each side of the river, which is here crossed by an old stone bridge of two arches. There is a castle in the town, the keep of which, called Cæsar's Tower, is still in tolerable condition. The Lent and summer assizes are held at A. Until the passing of the Reform Bill, it returned two members to parliament. It was then disfranchised, though it still possesses a municipal corporation. Pop. (1871) 1989.

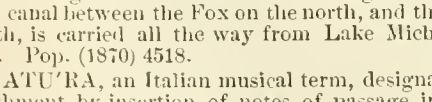
A'PPLETON, a town in Wisconsin, in the United States, worthy of notice chiefly from its promising situation on the Grande Chute of the Fox River. The Grande Chute, from which the town sometimes takes its name, affords immense water-power; and at the same time a series of dams renders the stream navigable for steam-boats through its whole course—a navigation which, with the aid of a canal between the Fox on the north, and the Wisconsin to the south, is carried all the way from Lake Michigan to the Mississippi. Pop. (1870) 4518.

APPOGIATU'RA, an Italian musical term, designating a form of embellishment by insertion of notes of passage in a melody. The A. notes are printed in a smaller character than the leading notes of the melody, and should always be given with considerable expression. When they are extemporized by a performer or singer, they serve as an indication of good or of bad taste. The time of an A. is taken from the essential note to which it belongs, as in the following example:

Written.



Played.



For APPOGIA'TO, see PORTAMENTO.

APPOI'NTMENT. In the law of England, there are frequently reserved in common law conveyances granted on a consideration, and in family settlements, certain *powers*, as they are called, such as powers of jointuring, selling, charging land with the payment of money; and the subsequent exercise of the power is called an *A.* This A.—which may be made either by deed or by will—is not considered as an independent conveyance, but is merely ancillary to the deed or instrument in which the power of A. is reserved, and from which the party in whose favor the A. is made for most purposes derives his title. The courts of Equity give relief against a defective A., or defective execution of a power, where there is what is called a 'meritorious consideration' in the person applying for such relief. As to what amounts to such meritorious consideration, Lord St. Leonards, in his work on Powers, lays down that Equity will relieve the following parties: 1. A purchaser, including in such term a mortgagee and lessee; 2. A creditor; 3. A wife; 4. A legitimate child; and 5. A charity. But in the case of a defective A. by a wife in favor of her husband, there is no relief in Equity; nor is the Equity extended to a natural child; nor to a grandchild; nor to father or mother, or brother or sister, even of the whole blood, much less of the half-blood; nor to a nephew or cousin. Against the legal consequences of an A., the Courts of Equity give no aid.

In the Scotch law, the expressions *reserved power* and *faculty to burden* correspond to the English phrase 'power of A.;' and the deed or instrument subsequently executed in virtue of the reserved power, is simply described according to the nature and quality of the conveyance so made; but the term *A.* is not a technical word in Scotland.

APPOI'NTMENTS. The 'A.' of a ship are, collectively, all her various articles of equipment and furniture. In like manner, the 'A.' of a soldier, especially a trooper, comprise many miscellaneous necessaries which can come collectively under no other name, but which, in part, will be found noticed under later headings. See EQUIPMENT, KIT, KNAPSACK.

APPO'RTIONMENT is a legal term derived from the 4 and 5 Will. IV. c. 22, called the Apportionment Act, which has given rise to much litigation in England and Scotland, and the principle of which may be stated to be this—that in the event of the termination of a life-interest by death, or of a more limited interest at a fixed period, the current rent or income shall be apportioned or paid over in such a way as to give the personal representatives of the party, or the party himself, as the case may be, a sum corresponding to the period that may have elapsed between the last date of payment and the death or other determination of the interest or estate. But the act has no application to annual sums payable by any policy of assurance, nor to any case in which a stipulation has been made that no A. shall take place.

This act was not understood to apply to Scotland till the year 1844, when it was decided by the Court of Session that it did so apply, and the judgment was afterwards affirmed by the House of Lords. But, in consequence of the act being expressed exclusively in the technical phraseology of the law of England, it has given much trouble. And a later act of 33 and 34 Vict. c. 35, extends the principle to all rents, annuities, salaries, pensions, dividends, and other periodical payments, in the nature of income, so that all these now, like interest on money lent, are considered as accruing from day to day. When a person therefore dies, the income is counted up to the day of death, and is payable at the same time as the next quarterly or other payment would be if no death had happened. In English law, A. also takes place where the tenant, under a lease, has been deprived of part of the land out of which the rent issues, by a person having a better title than the lessor, or proprietor, or where part of the rent has been surrendered by the tenant to the lessor, or where the lessor has disposed of the reversion as to part. But where the tenant has been wrongfully deprived by the act of the landlord himself, even of a part of the premises, there can be no A., but the whole rent will be suspended so long as such a state of things continues.

A. also obtains in the case of a conveyance of land to which the common of pasture is an appurtenance, the party getting the land being entitled to a proportionate use of the common.

APPOSI'TION, a term in Grammar signifying the annexing of one substantive to another, in the same case or relation, in order to explain or limit the first; as, *My brother, the physician; Thomas the Rhymer*. Whole sentences or clauses admit of A.: thus, 'Napoleon sought the way to India through Russia, a stroke of genius.' Sometimes a connecting word is used where logical propriety would require A.; as, *the city of London*, for *the city London*.

APPRAI'SERS AND APPRAI'SEMENT. An appraiser is a person employed to value property, but he must be licensed for the office. Formerly, under the 55 Geo. III. c. 184, this annual license cost only 10*s.*; but by the 8 and 9 Vict. c. 76, s. 1, on the preamble that it is expedient to increase this duty, the provision

of the 55 Geo. III. is repealed, and a duty of £2 substituted for the 10*s*. Such a license must now be taken out yearly by every person, except a licensed auctioneer, who shall exercise the occupation of an appraiser, or who, for any gain, fee, or reward, shall make any appraisement or valuation chargeable by law with any stamp-duty (see Tilsley on the Stamp-laws, 2d. ed., p. 65).

By an old English statute, passed in the reign of Edward I., appraisers are enjoined to put a reasonable price upon goods; and if they appraise them too high, they are obliged to take them at their own valuation, and to be answerable accordingly to the creditor for his debt.

Appraisement, generally, is the act of valuation made by the appraiser; but in legal application in England, this term is used to signify a valuation of goods taken under a distress for rent by two appraisers, who are sworn by the sheriff, under-sheriff, or constable, to value the goods truly, according to the best of their skill; and after such appraisement, the goods may be sold at the best price that can be procured.

The duties on appraisements are for £5 and under, 3*d*.; from £5 to £10, 6*d*.; from £10 to £20, 1*s*.; from £20 to £30, 1*s*. 6*d*.; from £30 to £40, 2*s*; from £40 to £50, 2*s*. 6*d*.; and where it shall exceed

£50, and not exceed £100,	£0	5	0
100, " " 200,	0	10	0
200, " " 500,	0	15	0
500,	1	0	0

The exemptions from such duties are appraisements or valuations made in pursuance of the order of any Court of Admiralty or Vice-admiralty, or of any Court of Appeal from any sentence, adjudication or judgment of any Court of Admiralty or Vice-admiralty; and appraisements or valuations of any property made for the purpose of ascertaining the legacy-duty payable in respect thereof.

The corresponding proceeding in Scotland is known under the term *appreciation*, which has been defined as the valuing of *poinded* or distrained goods. And by the old Scotch law, these goods were valued twice by different valuators—once in the house or on the ground where the poinding took place, and a second time at the market-cross of the local jurisdiction or chief county town. But by the 54 Geo. III. c. 137, s. 4, one valuation in the place where the goods are, is declared in every case to be sufficient.

APPREHE'ND. To A., in criminal law, means to arrest or seize, in virtue of a warrant or other legal authority, an offender taken in the act, or who is suspected. Arrest or apprehension by officers *without warrant* may be executed by the following persons: 1. By a justice of the peace, who may himself A., or cause to be apprehended, by word only, any person committing a felony or breach of the peace in his presence; 2. The sheriff; 3. The coroner; 4. The constable; 5. By the Larceny Act (24 and 25 Vict. c. 96), and by the 24 and 25 Vict. c. 97, called the Malicious Injuries Act, a person committing any offence under the same, except that of angling in the daytime, may immediately be apprehended without written warrant. Watchmen—either those appointed by the statute of Winchester (13 Edw. 1. c. 4), to keep watch and ward on all towns from sunsetting to sunrising, or such as were mere assistants to the constable, might, in virtue of their office, arrest all offenders, and particularly night-walkers, and commit them to custody till the morning; but not so now.

Any private person, and, *a fortiori*, a peace-officer, that is present when any felony is committed, is bound by the law to arrest the felon, on pain of fine and imprisonment, if he is negligently permitted to escape; and by 24 and 25 Vict. c. 95, they may apprehend any person found committing any offence against the provisions of that statute, or any indictable offence by night; that is, between nine in the evening and six in the morning of the next day. They may also, in the case of a person committing a felony in their presence, justify breaking open doors in pursuit of him. Upon probable suspicion, however, no one, being a private person, may arrest the felon or other person so suspected. And there is this distinction between the case of a peace-officer and that of a private person—that the former is protected, though it should turn out that no such crime as supposed has been in fact committed by any one, providing he had reasonable ground for suspecting the party arrested; but the latter acts more at his peril, and is not protected unless he can prove an actual commission of the crime by *some one*, as well as a reasonable ground for arresting the particular person. It is also to be observed that a private person cannot, on mere suspicion, justify breaking open doors, which a constable, though acting without a warrant, sometimes may do. Within the metropolitan police district, a constable may take into custody, without warrant, all persons whom he may find, between sunset and the hour of eight in the morning, loitering or lying about, and unable to give a satisfactory account of themselves; or persons charged with aggravated assaults; or persons offending against the metropolitan police acts, whose address cannot be ascertained. See 2 and 3 Vict. c. 47, ss. 36, 64, 65.

The Scotch law, with regard to the apprehension of criminals, is substantially the same as the English.

By the statutes passed in 45 Geo. III. c. 92, and the 11 and 12 Vict. c. 42, facilities are afforded for the apprehension of criminals in England, Ireland, or Scotland, under warrants issuing from the respective authorities of the three countries, no further formality being necessary in the case of English and Irish warrants to be executed in Scotland, and *vice versâ*, than that they should be endorsed by a judge of the territory where they are to be enforced. And by the 6 and 7 Vict. c. 34, provisions are made for the apprehension, in the United Kingdom of Great Britain and Ireland, of persons committing treason and felony in Her Majesty's dominions out of the United Kingdom, and *vice versâ*, for the apprehension in such dominions of persons offending in England, Ireland, or Scotland. By section 3, offenders may be committed to gaol until they can be sent back to the place where the offence was committed; and information of the committal, in writing, under the hand of the committing magistrate, accompanied by a copy of the warrant, is directed to be given, in Great Britain, to one of her Majesty's principal secretaries of state, and in Ireland, to the chief secretary of the lord-lieutenant; and in any other part of Her Majesty's dominions, to the governor or acting governor.

By section 10, the important enactment is made, that it shall not be lawful to endorse any warrant for the apprehension of an offender under the act, unless it shall appear upon the face of such warrant itself, that the offence is such, that if committed within that part of Her Majesty's dominions where the warrant is endorsed, it would have amounted in law to treason, or some felony such as the justices of the peace in general or quarter sessions in England have not authority to try, under the existing acts—by which the jurisdiction of general and quarter sessions is defined—or unless the depositions taken appear sufficient to warrant committal for trial. The effect of this enactment is, that the offences for which criminals may be apprehended, under the 6 and 7 Vict. c. 34, are as follows: Any treason, murder, or capital felony; or any felony which, when committed by a person not previously convicted of felony, is punishable by transportation for life, or for any of the following offences:

1. Misprision of treason. 2. Offences against the Queen's title, prerogative, person, or government, or against either house of parliament. 3. Offences subject to the penalties of præmunire. 4. Blasphemy, and offences against religion. 5. Administering or taking unlawful oaths. 6. Perjury and subornation of perjury. 7. Making or suborning any other person to make a false oath, affirmation, or declaration, punishable as perjury or as a misdemeanor. 8. Forgery. 9. Unlawfully and maliciously setting fire to crops of corn, grain, or pulse, or to any part of a wood, coppice, or plantation of trees, or to any heath, gorse, furze, or fern. 10. Bigamy, and offences against the laws relating to marriage. 11. Abduction of women and girls. 12. Endeavoring to conceal the birth of a child. 13. Offences against any provision of the laws relating to bankrupts and insolvents. 14. Composing, printing, or publishing blasphemous, seditious, or defamatory libels. 15. Bribery. 16. Unlawful combinations and conspiracies, except conspiracies or combinations to commit any offence which justices or recorder respectively have or has jurisdiction to try when committed by one person. 17. Stealing, or fraudulently taking, or injuring or destroying records or documents belonging to any court of law or equity, or relating to any proceeding therein. 18. Stealing or fraudulently destroying or concealing wills or testamentary papers, or any document or written instrument being or containing evidence of the title to any real estate, or any interest in lands, tenements, or hereditaments.

In 1870, a statute (amending statutes of 1843, &c.), was passed, by which provisions are made for carrying into effect a convention entered into between the British and foreign governments (determinable at pleasure), for the apprehension of offenders in the two countries respectively in *cases of murder, forgery, robbery, rape, larceny, embezzlement, obtaining money by false pretences, burglary, all bankruptcy crimes; frauds by bankers, factors, trustees, directors; abduction, child-stealing, arson, piracy, sinking and destroying vessels at sea*, &c. This act gets rid of the former practice of passing a separate act to regulate the extradition of criminals between Great Britain and each country, as nearly all civilized countries have now entered into this kind of confederacy. There is an exception made in favor of fugitive criminals whose surrender is demanded on the ground of offences of a political character; and the condition of surrender always is, that, when taken back to his own country, he shall not be tried for political offences.

The law encourages the apprehension of offenders by parties who simply act from a feeling of duty to assist justice. By the 7 Geo. IV. c. 64, s. 28 (amended and extended by the 14 and 15 Vict. c. 55), it is provided that when any person shall appear to any court of oyer and terminer, gaol delivery, superior criminal court of a county palatine, or any courts of sessions of the peace, to have been active in or towards the apprehension of any person charged with the various crimes contemplated by these statutes,

every such court is authorized to order the sheriff of the county to pay to the person or persons who shall appear to the court to have been active in or towards the apprehension of any person charged with any of the said offences, such sum of money as to the court shall seem reasonable and sufficient to compensate such person or persons for his, her, or their expenses, exertions, and loss of time, in or towards such apprehension; but this power is to be exercised subject to such regulations, as to the rate of allowance, as shall be made from time to time by a principal secretary of state. Provision is also made by the above statutes for compensation to the families of those who lose their lives in attempting to A. persons charged with criminal offences; but by the latter of these (14 and 15 Vict. c. 55, s. 7), this is not to interfere with the power of the criminal court to order payment to any person who shall have shown extraordinary courage, diligence, or exertion in the apprehension.

It only remains to be added, that any wilful obstruction of a lawful arrest or apprehension is esteemed an offence of a very aggravated nature. The modern enactments on this subject will be found in the statute passed in 1861 to amend the law of England and Ireland as to offences against the person, 24 and 25 Vict. c. 100, by which statute it is provided that where any person shall be convicted of any assault upon any peace-officer, or revenue-officer, in the due execution of his duty, or upon any person acting in aid of such officer, or of any assault upon any person, with intent to resist or prevent the lawful apprehension or detainer of the person so assaulting, or of any other person, for any offence for which he or they may be liable by law to be apprehended or detained; such assault shall be a misdemeanor, punishable with fine, or by imprisonment, with or without hard labor, for any term not exceeding two years.

By the before-mentioned statute it is enacted that whosoever shall unlawfully and maliciously shoot at any person, or shall, by drawing a trigger, or in any other manner, attempt to discharge any kind of loaded arms at any person, or shall stab, cut, or wound any person; with intent, in any such cases, to resist or prevent the lawful apprehension or detainer of any person; shall be guilty of felony, and be punishable with penal servitude for life, or not less than three years, or with imprisonment, with or without hard labor and solitary confinement, for not more than two years. And by the 14 and 15 Vict. c. 19, s. 12, passed for the prevention of offences at night, any one assaulting a person entitled to A. or detain him, shall be guilty of a misdemeanor, and on conviction, imprisoned, with or without hard labor, for any term not exceeding three years.

The same subject is treated in Scotch law-books under the head of *Deforcement*, which Sir Archibald Alison, in his work on the Criminal Law of Scotland (vol. i. p. 491), says, 'consists in the resistence to the officers of justice in the execution of their duty.' It is essential to such deforcement that it should be such as to defeat the warrant or other process which authorizes the apprehension. Mere unsuccessful attempts with this view are charged under the name of *resisting and obstructing the officers of the law in the execution of their duty*. See WARRANT OF APPREHENSION.

APPRE'NTICE is a person described in law-books as a species of servant, and called A. from the French verb *apprendre*, to learn, because he is bound by indenture to serve a master for a certain term, receiving in return for his services instruction in, or learning his master's profession, art, or trade; the master, upon the other hand, contracting to instruct the A., and according to the nature of the agreement, to provide food and clothing for the A., and to pay him small wages. Sometimes a premium is paid by the A., or on his behalf, to the master. By a provision of the 5 Eliz. c. 4, which remained in force until a recent period, it was in general required, that every person exercising a trade in England should have previously served as A. to it for seven years; but by later statutes, that provision was abolished, with a saving of the customs and by-laws in London and other corporations; and the term of apprenticeship is now determined by the mutual convenience of the contracting parties. By the municipal act, 5 and 6 Will. IV. c. 76, s. 14 (which does not, however, extend to London), all such customs and by-laws as had the effect of prohibiting trades and occupations to persons who had not served as apprentices, were also done away. Apprentices, in general, are bound out by their friends, though with their own consent, testified by their executing the indentures, without which the transaction is not binding.

To the same effect it is the rule of the Scotch law that although a pupil—that is, a boy under, 14, or a girl under 12 years of age—may be a party to an indenture as an A., yet he must have the concurrence of a parent or guardian, who alone can be liable to the master for the A.'s non-performance of the engagement. An A., on the other hand, who has passed the years of pupilarity, may effectually enter into an indenture by which he will be personally bound. It has been decided in England that the express assent of an infant A. to the indentures is essential to the contract; and therefore indentures of apprenticeship which have been executed by a father and master, but not by the A. himself, were held invalid. But an infant may bind himself A., because it is for his benefit; for the same reason, however, he cannot himself dissolve the contract. When an A. is bound to two partners, on the death of one of them the apprenticeship is at an end.

There is a class who are bound out by the guardians of the poor, and are called *parish apprentices*, whose binding takes place under different circumstances. For the children of poor persons might formerly, even without becoming parties of the indentures, be apprenticed out by the overseers with the consent of two justices (and may now by the guardians, without such consent), till twenty-one years of age, to such persons as are thought fitting; and these persons were formerly also compellable to take them. But by 7 and 8 Vict. c. 101, s. 13, the reception of any poor child as an A. is no longer compulsory. A variety of statutes regulate the manner in which parish apprentices are to be bound, assigned, registered, and maintained; a subject which is besides now placed under the paramount control of the Local Government Board, who make new rules from time to time, as they may think fit; and provisions are made by which the justices of the peace are empowered to settle disputes between such apprentices and their masters, and to discharge the former from their indentures, upon reasonable cause shown. Similar powers belong also to the justices, in the case of apprentices in general. (Stephen's *Commentaries*, vol. ii. p. 240, fourth edition.) It has been decided in England that a corporation cannot make a by-law limiting the number of apprentices which each member shall take, because such a regulation is deemed contrary to the laws of the land.

A mere agreement does not constitute an apprenticeship; there must be regular indentures formally executed. By statute 33 and 34 Vict. c. 97, indentures of apprenticeship in which the full sum or sums of money received, given, paid, secured, or contracted for, are not truly inserted, are void. But the act does not apply to cases where the sum is inserted in the indentures, though it is a less sum than that which was originally agreed for, and the reduction made to diminish the amount of the stamp-duty.

In the performance of the contract, a reasonable and equitable view is taken of the relative position of the parties. The master is not bound to the literal and uniform instruction of the A. by himself personally, but under his own superintendence, and by his own directions, he may avail himself of the assistance of journeymen, or other persons serving in his place of business, and even of other apprentices—the object of the agreement being that the A. shall have the full benefit of all the master's arrangements in practising his art, craft, or trade. The A., on the other hand, although in the position of a servant to some extent, is not bound to serve as such, but may rather be said to be placed under the parental control of the master; and perhaps the master may correct the A.'s faults and disobedience by moderate chastisement, if the A. is still under age; nor can he discharge the A. To that end, the master, under an unrepealed enactment of the 5 Eliz. c. 4, must complain to the justices, who decide whether the A. has merited his dismissal or not; the A., however, having a corresponding privilege in the case of his complaint against his master. But, by the Scotch law, a master can dismiss his apprentice in the case of his proving 'incorrigible.' By the custom of the city of London, a freeman may turn away his apprentice for *gaming*.

It was decided by the House of Lords, on an appeal from Scotland in 1837 and reversing the decision of the Court of Session, that a barber's A., whose indentures bound him 'not to absent himself from his master's business, holiday or week-day, late hours or early, without leave first asked and obtained,' could not be lawfully required to attend his master's shop on Sunday mornings for the purpose of shaving customers, because such employment was a violation of the old Scotch statutes still in operation, and which were enacted for enforcing the observance of the Sunday, particularly one passed in 1559, by which it is provided 'that na handy lauboring or wirking be used on the Sonday.' The Lord Chancellor (Lord Cottenham) observed in his judgment that the English law on this subject was very similar, referring in particular to the 29 Charles II. c. 7, by which it is enacted 'that no tradesman, artificer, workman, labourer, or other person whatsoever shall do or exercise any worldly labour business, or work, of their ordinary callings, upon the Lord's Day, or any part thereof, works of necessity and charity only excepted.'

An A.'s indenture is determined by the consent of all the parties to it; and also by the death of the master. But the executor of the latter may bind the A. to another master if the contract so provide; and he must also discharge any covenant or agreement for the A.'s maintenance, so far as he has assets. By the custom of London, if the master of an A. die, the service must be continued with the widow, if she continue to carry on the trade. In other cases, it is incumbent on the executor to put the A. to another master of the same trade. The bankruptcy of the master operates as a discharge of the indenture of the A., who, if he has paid an A. fee to the bankrupt, is entitled to be paid by the court at a reasonable sum out of the estate.

By the Mutiny Act, apprentices enlisting in the army, and concealing their apprenticeship when brought before a magistrate to be attested, may be indicted for obtaining money under *false pretences*; and if, after the expiration of their apprenticeship, they do not surrender to a recruiting officer, they may be apprehended as deserters.

There is some curious historical matter on this subject, relating for the most part to a state of the law now obsolete or repealed, for which see Knight's *Political Dictionary*, under this head.

APPRI'SING is the old technical term in the Scotch law, and now obsolete, for the process of adjudication. See ADJUDICATION.

APPROA'CHES, in military language, are the sunken trenches or excavated roads which are constructed by besiegers. The siege camp being usually at a considerable distance from the fortress or city attacked, the soldiers would be exposed to imminent danger while hastening across a belt of open country to enter any breaches made by the large siege guns, were it not that concealed roads are first constructed along which they may approach. In some cases the A. are not actual trenches, but merely paths shielded by a piled-up wall of sand-bags, fascines, gabions, woolpacks, or cotton-bales. The most tremendous combination of A. ever known in the history of military enterprise, was the siege of Sebastopol in 1854–5; it comprised the digging of no less than 70 miles of sunken trench, and the employment of 60,000 fascines, 80,000 gabions, and 1,000,000 sand-bags, to protect the men working in the trenches and at batteries. See SAP, SIEGE.

A'PPROBATE AND RE'PROBATE. This is a technical expression in the law of Scotland, which signifies one of those rules of justice which commend themselves by their reasonable logic, and which are to be found in all enlightened systems of jurisprudence. It simply means, that no one can be permitted to A. and R.—that is, to accept and reject the same deed or instrument. Thus, if a will or settlement, purporting to dispose of real and personal property, all of which it directs to be converted into money, and in that form either to be equally divided or apportioned among the testators' children, consisting of a son or sons, and daughters, should, owing to some flaw or material defect, be invalid for the conveyance of the real estate, which accordingly, by the operation of the law of descent, becomes the exclusive property of the eldest son as his father's heir—the law does not permit the latter to enjoy such estate, and at the same time to take benefit under the will in other respects, for this would be simultaneously to accept and reject the same instrument: he must elect between the two alternatives, and either avail himself entirely of rights at law, as heir, or claim his share of the whole estate according to the testator's manifest intention—he cannot do both. Other illustrations might be given, showing distinctions too nice perhaps for popular information. The analogous doctrine in the law of England is called ELECTION (q. v.). In one case decided by the House of Lords in 1819, the Lord Chancellor Eldon treated the rule in the Scotch and English legal systems as identical, observing that it was equally settled in Scotland as in England that no person can accept and reject the same instrument; and he puts the case of a testator giving his estate to A, but also giving the estate to which A would otherwise have been entitled, to B; in that case his lordship stated that courts of equity hold it to be against conscience that A should take the estate bequeathed to him, and at the same time refuse to effectuate the implied condition contained in the will of the testator. The court will not permit him to take that which cannot be his but by virtue of the disposition of the will, and at the same time to keep what, by the same will, is given, or intended to be given, to another person. It is contrary to the established principles of equity that he should enjoy the benefit while he rejects the condition of the gift.

It is chiefly in the case of wills and other testamentary dispositions that this legal doctrine most frequently arises in practice, although there can be no question that both in the English and Scotch systems of law it extends to all other writings, deeds, and instruments.

APPROPRI'ATION CLAUSES, THE. This was the name by which, while the discussion continued, reference was usually made to an important question which occupied a large share of the attention of the legislature and of the public between the years 1833 and 1838. The expectation that the state of Ireland would improve after the passing of the Catholic Emancipation and Reform Acts had turned out to be fallacious. Among other grave causes of complaint left untouched by these measures, was the collection of tithes by the Established Church, and from that cause proceeded very many of the evils with which Ireland was then afflicted. To such an extent was the antipathy to tithes carried, that a clergyman who ventured to exact payment by legal measures in the exclusively Catholic countries, did so at the risk of his life. Several clergymen had actually been assassinated, and others were so unpopular, that the utility of the Irish Church in three-fourths of Ireland was almost destroyed. This was a state of matters which could not be permitted to last. Coercive measures had been tried, and had failed to produce any amelioration. The remedies which then suggested themselves were three: First, the commutation of tithes into a rent-charge upon land; second, the reduction of the number of sinecures in the Irish Protestant Church; and third, the appropriation of the surplus revenues of that church to the advancement of the general education of the people.

The first of these measures the liberal cabinet of 1833 attempted, but—from leaving the commutation to take place at the option of the landlord—carried into effect in a manner so unsatisfactory, that no good whatever resulted. The second was carried out with more success. The Irish Church Temporalities Act struck off two archbishopries, ten bishopries, and various sinecures, and applied the revenues thus acquired chiefly to supply the place of an impost called 'vestry cess' (analogous to church-rates) which was abolished. This act, however, still left the church with an income greatly disproportioned to the number of her adherents. The cabinet was divided in regard to the third measure, a majority being in favor of the principle of appropriation, and a minority, consisting of the Irish Secretary, Mr. Stanley (afterwards Earl of Derby), Sir James Graham, Lord Ripon, and another, being opposed to it. The minority had influence enough to prevent government from espousing the principle, and even to procure the abandonment of the 147th clause of the Church Temporalities Bill, because the opposition asserted, though incorrectly, that it virtually embodied the principle. This was the first of the Appropriation Clauses.

In the following year, 1834, it had become fully apparent that the tithe act of 1833 had failed, and the state of Ireland rendered it more imperative than ever to settle the tithe question. Mr. Ward, throughout a steady supporter of the principle of appropriation, moved in the House of Commons, on 27th May, 1834, 'that it was right that the state should regulate the distribution of church property in such a manner as parliament might determine.' This raised the whole question of appropriation, and that greatly to the annoyance of ministers. The split in the cabinet was well known not to have been healed, and while Mr. Ward was speaking, news reached Lord Althorp that the minority had resigned. This stopped the debate for the night. The ministers left in office found themselves relieved of a portion of their difficulties, but as they were aware that the King was strongly opposed to the appropriation principle, and that there was no prospect of the House of Lords assenting to it, they were most anxious to find some means to delay committing themselves in the matter. A commission was accordingly appointed to collect information; and on June 2, Lord Althorp met the Commons, impressed on them how useless it was to discuss a mere abstract principle, and on Mr. Ward refusing to withdraw his motion, moved and carried the previous question by a large majority.

The short lived ministry of 1835, under Sir Robert Peel, was in office when the appropriation question next came before parliament. The Liberals were in opposition; and Lord John Russell, who had succeeded to the Whig leadership in the Commons, on Lord Althorp's removal to the House of Lords, was now prepared to commit his party to the appropriation principle. When Sir Robert Peel brought forward a tithe commutation bill to supplement the bungled measure of 1833, Lord John Russell proposed two resolutions, which gave rise to one of the longest and most important of the numerous debates which have taken place on the question. On the one side, the chief speakers were Ward, Lord Howick, Sheil, and O'Connell; and on the other, Peel, Stanley, Sir James Graham, and Gladstone. Much of the interest which attended the discussion was caused by its involving the whole question of church establishments, and by a fear, on the part of the English Conservatives, that the doctrines of utility and expediency, so freely referred to in connection with the Church of Ireland, might one day be turned against the Church of England. On 2d April 1835, the House of Commons pronounced, by a majority of 33, 'that any surplus which might remain, after fully providing for the spiritual instruction of the members of the Established Church of Ireland, ought to be applied to the moral and religious education of all classes, without distinction of religious persuasion;' and a few days afterwards, a subsequent resolution was passed, 'That no settlement of the tithe question would be satisfactory unless it embodied the preceding principle.' In consequence of these resolutions, the Conservatives resigned, and the Liberals returned to power.

There was now in office a ministry pledged to the appropriation principle. In 1836, ministers brought forward a tithe commutation bill, containing clauses carrying out the principle fully and explicitly. The bill passed the Commons, but the A. C., were struck out by the Lords. The bill was thereupon abandoned. In 1837, a government tithe commutation bill again passed the Commons with A. C., and again these clauses were struck out by the Lords. On the motion of the ministers, the Commons rejected the amended bill. After the general election of 1837, the Melbourne ministry found themselves with a very narrow majority in the Commons. The liberal members had made the appropriation question a prom

ment topic at the election; but it was too apparent that England and Scotland were becoming weary of the interminable discussions upon Irish affairs. In the meantime, the state of Ireland was little better, and with an increasing party in the House of Commons to back them, there was no prospect of the Lords giving away upon the appropriation question. Still, it was necessary that something should be done, and the choice of the ministry lay between carrying a commutation bill without A. C., and resignation. The former course was chosen. The tithe measure was introduced, and ministers solaced themselves for their desertion of principle by the reflection, that after all there might be no surplus to appropriate, and that it would therefore be useless to prolong a collision with the Upper House on a matter of no practical importance. This conduct emboldened the opposition, and Sir Thomas Acland, on 14th May 1838, moved the recall of the celebrated resolutions of 1835 The discussion which followed was most damaging to the ministers, but they were saved, by a majority of 19, from the humiliation of having the resolutions recalled. A last effort in support of the principle was made in July 1838, by Mr. Ward, who then moved the insertion of A. C. into the government tithe bill. He was opposed by the whole ministerial force, and more strangely still, by the Irish members. O'Connell, who in 1835 had spoken of the one magical word 'appropriation,' which was to bring peace to Ireland, declared now that nothing would satisfy the Irish people except the total abolition of tithes. Thus deserted and opposed, Mr. Ward's motion was lost by a large majority. The government tithe measure passed in August 1838, and tithes were commuted into a rent-charge of three-fourths of their amount. After that, they were collected with comparative facility, and the appropriation question, once the topic of discussion over the whole country, fell into oblivion, until the disendowment of the Episcopal Church in Ireland, in 1869, revived it in a new shape.

APPRO'VER, or PROVER, in the law of England, is a person who had been an accomplice in the perpetration of a crime, but who is admitted to give evidence against the prisoner. It had not so simple and intelligible a meaning in the ancient practice of the criminal law, in which *approvement* was a kind of confession of a complicated nature. Where a person in a prosecution for treason or felony confessed the fact before pleading to the indictment, and, at the same time, accused others, his accomplices, of the same crime, in order to obtain his pardon, he was called an A. or P. But, as the condition of the pardon he thus expected was the conviction of the accomplice he accused, if that failed, the A. received judgment of death upon his own confession. If, on the other hand, the accused accomplice was found guilty, the A. was entitled to his pardon *ex debito justitiæ*. But 'this course of admitting approvements,' says Blackstone, writing about a century ago, 'hath long been disused; for the truth was, as Sir Matthew Hale observes, that more mischief arose to good men by these kinds of approvements, upon false and malicious accusations of desperate villains, than benefit to the public by the discovery and conviction of real offenders; and, therefore, in the times when such appeals were most frequently admitted, great strictness and nicety were held therein; though, since their discontinuance, the doctrine of approvements is become a matter of more curiosity than use.'

The modern practice is to admit accomplices to give evidence for the prosecution, or, as it is said, to become *Queen's evidence*, upon an implied promise of pardon, on condition of their making a full and fair confession of the whole truth. The admission, however, of an accomplice to give evidence against his fellows, requires the previous sanction of the judges of jail delivery, and a motion is usually made at the trial to the judge for leave to admit the accomplice for that purpose. The testimony of an accomplice is in all cases, however, regarded with just suspicion; and unless his statement is corroborated in some material part by unimpeachable evidence, the jury are usually advised by the judge to acquit the prisoner; and if the accomplice, after having confessed the crime, and being admitted as Queen's evidence, does not satisfy the condition on which he was so received by failing to give full information without equivocation, reservation or fraud, he then forfeits all claim to protection, and may be tried, convicted and punished on his own confession. Accordingly, upon a trial at York, towards the commencement of the present century, before the late Mr. Justice Buller, the accomplice denied in his evidence all that he had before confessed, upon which the prisoner was acquitted. But the judge ordered an indictment to be preferred against the accomplice for the same crime, and on his previous confession and other circumstances, he was convicted and executed.

The term in the law of Scotland analogous to that of A. is *socius criminis*, and the principles on which such socius is admitted, and on which his evidence is left to the jury, are the same as in England. But the criminal courts in Scotland go further in protecting and assuring safety to the approver than the English practice does. Sir Archibald Alison, in his *Practice of the Criminal Law of Scotland*, vol. ii., p. 453, says: 'It has long been an established principle in our law, that by the very act of calling the *socius*, and putting him in the box, the prosecutor debars himself from all title to molest him for the future with relation to the matter libelled. This is always explained to the witness by the presiding judge as soon as he appears in court, and consequently he gives his testimony under a feeling of absolute security as to the effect which it may have upon himself. If, therefore, on any future occasion the witness should be subjected to a prosecution on account of any of the matters contained in the libel on which he was examined, the proceedings would be at once quashed by the supreme court. This privilege is absolute, and altogether independent of the prevarication or unwillingness with which the witness may give his testimony. Justice, indeed, may often be defeated by a witness retracting his previous disclosures, or refusing to make any confession after he is put into the box; but it would be much more put in hazard if the witness was sensible that his future safety depended upon the extent to which he spoke out against his associate at the bar. The only remedy, therefore, in such a case, is committal of the witness for contempt or prevarication, or indicting him for perjury, if there are sufficient grounds for any of these proceedings. In this respect the security of the *socius*, and the safeguard against the contamination of the sources of evidence, is much stronger in this country than in England, where it is held that the circumstance of having been adduced by the crown is not a bar to trial, but only the foundation for a recommendation to the crown for mercy, and is entirely dependent on the witnesses making a full and fair disclosure.' And Sir Archibald mentions a case where a soldier, who was adduced as an A. or *socius*, and who was under confinement as a military delinquent for the same offence, was nevertheless allowed to give evidence; and upon its being suggested as an objection to the soldier's being admitted as a witness, that he would still be open to be tried by a court-martial, the court declared that they had the power to protect him from such an ordeal, and that they would not fail to interfere on his behalf, if he were in any way endangered in consequence of his evidence.

It was chiefly on the evidence of an accomplice named William Hare, that Burke the notorious criminal was convicted before the High Court of Justiciary in 1828. See this case noticed previously in ANATOMY.

APPROXIMA'TION, a term commonly used in mathematical science to designate such calculations as are not rigorously correct, but approach the truth near enough for a given purpose. Thus in logarithmic and trigonometrical tables nearly all the numbers are mere approximations to the truth. The calculations of astronomy generally are of this nature. Even in pure mathematics there are parts in which approaches to the truth, by means of interminable series, are all we are able to gain. The solution of equations beyond the fourth degree can be got only by approximation.

APPUI (French), a stay or support. In military tactics, the *points d'A.* are such parts of the field of battle as are suited to give support or shelter. As the wings of an army (like the extreme sides of a chess-board) are the weakest points of resistance to attack, they especially require support or protection, and are placed, when it is possible, in localities which serve to obstruct the attacking forces. Lakes, morasses, woods, streams, and steep declivities may thus serve as *points d'A.*

APPULEI'US, or, less properly, APULEIUS, a satirical writer of the 2d c., was born at Madaura, in Africa, where his father was a magistrate, and a man of large fortune. A. first studied at Carthage, which at that time enjoyed a high reputation as a school of literature. Afterwards he went to Athens, where he entered keenly upon the study of philosophy, displaying a special predilection for the Platonic school. The fortune bequeathed to him at his father's death enabled A. to travel extensively. He visited Italy, Asia, &c., and was initiated into numerous religious mysteries. The knowledge which he thus acquired of the priestly fraternities, he made abundant use of afterwards in his *Golden Ass*. His first appearance in literature arose from a law-suit. Having married a middle-aged lady, named Pudentilla, very wealthy, but not particularly handsome, he drew down upon his head the malice of her relations, who desired to inherit her riches, and who accused the youth of having employed magic to gain her affections. His defence (*Apologia*, still extant), spoken before Claudius Maximus, proconsul of Africa, was an eloquent and successful vindication of his conduct. After this event, his life appears to have been devoted zealously to literature and public oratory, in both of which he attained great eminence. He was so extremely popular, that the senate of Carthage, and other states, erected statues in his honor.

The *Golden Ass*, the work by which his reputation has survived, is a romance or novel, whose principal personage is one *Lucian*, supposed by some, though on insufficient evidence, to be the author himself. It is generally understood to have been intended as a satire on the vices of the age, especially those of the priesthood,

and of quacks or jugglers affecting supernatural powers, though Bishop Warburton, and other critics, fancy they can detect in it an indirect apology for paganism. Its merits are both great and conspicuous, as are also its faults. Wit, humor, satire, fancy, learning, and even poetic eloquence abound, but the style is disfigured by excessive archaisms, and there is a frequent affectation in the metaphors, &c., which proves A. to have been somewhat artificial in his rhetoric. The most exquisite thing in the whole work is the episode of Cupid and Psyche (imitated by La Fontaine).

It is supposed to be an allegory of the progress of the soul to perfection. Besides the *Apologia* and *Golden Ass*, we have from the pen of A. an Anthology in four books, a work on the Dæmon of Socrates, one on the doctrines of Plato, one on *The Universe*, &c. A considerable number of his works also are lost. The most recent and careful edition of the whole works of A. is that published at Leipsic in 1842, by G. F. Hildebrand. The *Golden Ass* was translated into English by T. Taylor (1822), and again by Sir G. Head (1851). An English version of the works of A. was published in London, 1853.

APRA'XIN, THEDOR MATVAYEVICH, a distinguished Russian admiral, was born in 1671. When hardly twelve years of age, he entered the service of Peter the Great, who conceived a great attachment for him, which lasted during the whole life of the monarch. In 1699, he took part in the first manœuvres of the Russian fleet at Taganrog on the sea of Azof. After the year 1700, he became the most powerful and influential person at the court of the czar, who made him chief-admiral of the Russian navy, of which, in fact, A. may be considered the creator. While Peter was fighting the Swedes in the north, A. was building war-vessels, fortresses, and wharfs in the south. In 1707, he was appointed president of the Admiralty; in 1708, he defeated the Swedish general, Lübecker, in Ingermannland, and saved the newly-built city of Petersburg from destruction; in 1710, he captured the important town of Viborg, in Finland; and in 1711, commanded in the Black Sea during the Turkish war. The following year he returned to the north; and in 1713, with a fleet of 200 vessels, he sailed along the coast of Finland, took Helsingfors and Borgo, and defeated the Swedish fleet. The result of his great successes was, that at the peace of Nystadt, in 1721, Russia obtained some most valuable advantages, being confirmed in her possession of Finland, just conquered, and of Esthonia. In spite of his brilliant reputation, however, he twice suffered an apparent eclipse of imperial favor. In 1714—15 he was charged with embezzlement, tried, and condemned to pay a fine; and a few years later, was denounced by Peter himself as 'an oppressor of the people,' and again condemned to pay a fine; but his services were too useful to be dispensed with, and in both instances the czar neutralized the effect of the condemnation, by conferring upon him additional riches and dignities. In 1722, he accompanied Peter in his Persian war, and was present at the siege of Derbend. His last naval expedition was in 1726, when he repaired with the Russian fleet to Revel, to defend that place against an expected attack by the English. He died at Moscow, 10th November, 1728, in the 57th year of his age.

A'PRICOT (*Prunus Armeniaca*), a species of the same genus with the PLUM (q. v.), is a native of Armenia, and of the countries eastward to China and Japan; a middle-sized tree of 15—20, or even 30 feet high, with ovate, acuminate, and cordate, smooth, doubly-toothed leaves on long stalks; solitary, sessile, white flowers which appear before the leaves, and fruit resembling the peach, roundish, downy, yellow, and ruddy on the side next the sun, with yellow flesh. The A. was brought into Europe in the time of Alexander the Great, and since the days of the Romans has been diffused over all its western countries. It has been cultivated in England since the middle of the 16th c. It is only in the south of England that it is ever trained as a standard, nor is it grown in the more northern parts, even as an espalier, but almost always as a wall-tree. More than twenty kinds are distinguished, amongst which some excel very much in size, fine color, sweetness, and abundance of juice. The *Moorpark* is generally esteemed the finest variety, and the *Breda* as best suited for standards in the south of England, and in Scotland even for the wall, except in the most favorable situations.—The A. is generally budded on plum or wild cherry stocks. The fruit keeps only for a very short time, and is either eaten fresh, or made into a preserve or jelly. Apricots split up, having the stone taken out, and dried, are brought from Italy as an article of commerce, in particular from Trieste, Genoa, and Leghorn; in the south of France, also, they are an article of export in a preserved and candied state. Dried Apricots from Bokhara are sold in the towns of Russia, the kernels of which are perfectly sweet, like those of the sweet almond. The kernels are sweet in some kinds, and bitter in others—the bitterness being probably more natural, and the sweetness, as in the almond, the result of cultivation. Generally speaking, they may be used for the same purposes as almonds. From the bitter kernels, which contain Prussic acid, the *Eau de noyaux* is distilled in France. The charred stones yield a black pigment similar to Indian ink. The wood of the tree is good only for the purposes of the turner.

The BRIANÇON A. (*Prunus Brigantiaca*) very much resembles the common A. The fruit is glabrous. It is found in Dauphiné and Piedmont. At Briançon, an oil, called *Huile de marmotte*, is expressed from the seeds.

The SIBERIAN A. (*P. Sibirica*) is also very like the common A., but smaller in all its parts. The fruit is small. It is a native of Siberia, especially of the southern slopes of the mountains of Dahuria.

The A. PLUM is an excellent kind of plum, much cultivated in some parts of France, and which, preserved in sugar, dried, and packed in shallow boxes, forms a considerable article of trade.

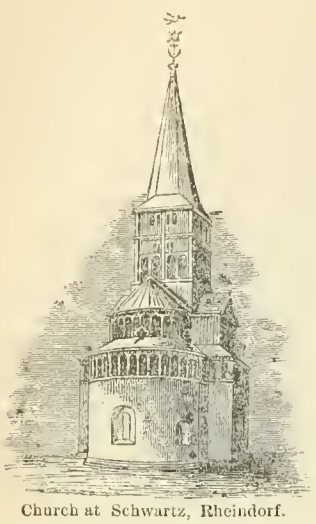
A'PRIL. The Romans gave this month the name of *Aprilis*, from *aperire*, to open, because it was the season when the buds began to open; by the Anglo-Saxons it was called Ooster, or Easter-month; and by the Dutch Grass-month. The custom of sending one upon a bootless errand on the first day of this month, is perhaps a travesty of the sending hither and thither of the Saviour from Annas to Caiaphas, and from Pilate to Herod, because during the middle ages this scene in Christ's life was made the subject of a miracle-play (q. v.) at Easter, which occurs in the month of A. It is possible, however, that it may be a relic of some old heathen festival. The custom, whatever be its origin, of playing off little tricks on this day, whereby ridicule may be fixed upon unguarded individuals, appears to be universal throughout Europe. In France, one thus imposed upon is called *un poisson d'Avril* (an A. fish). In England, such a person is called an A. fool; in Scotland, a gowk. Gowk is the Scotch for the cuckoo, and also signifies a foolish person. The favorite jest in Britain is to send one upon an errand for something grossly nonsensical—as for pigeon's milk, or the History of Adam's Grandfather; or to make appointments which are not to be kept; or to call to a passer-by that his latchet is unloosed, or that there is a spot of mud upon his face. When he falls into the snare, the term A. fool or gowk is applied with a shout of laughter. It is curious that the Hindus practise precisely similar tricks on the 31st of March, when they hold what is called the Huli Festival.

A-PRIO'RI reasoning or demonstration is that which rests on general notions or ideas, and is independent of experience. Reasoning from experience is called *a-posteriori* reasoning. A. predilection for one or the other of these forms of reasoning forms one of the most important distinctions among schools of philosophy. Plato may be taken as typical of the A-P. school, Locke and Bacon of the other. A-P. speculation is more in accordance with the genius of the Germans than with that of the practical British. A-P. philosophy claims for its conclusions the character of necessary truths, and denies that there can be a-posteriori proof of anything, that kind of reasoning furnishing only a confirmation or verification. The opposite school maintain that the general notions or principles on which A-P. reasoning rests, are themselves the results of experience, and that, therefore, all truth rests really on *a-posteriori* grounds.

A'PRON. This word is employed both in military and in shipping affairs. The A. of a cannon is a piece of sheet-lead which covers the touch-hole, tied by two pieces of white rope. In shipbuilding, the A. is a piece of curved timber fixed behind the lower part of the stem, and just above the foremost end of the keel; its chief use is to fortify the stem, and connect it more firmly with the keel. The name of A. is also given to the plank-flooring raised at the entrance of a dock, a little higher than the bottom, to form an abutment against which the gates may shut.

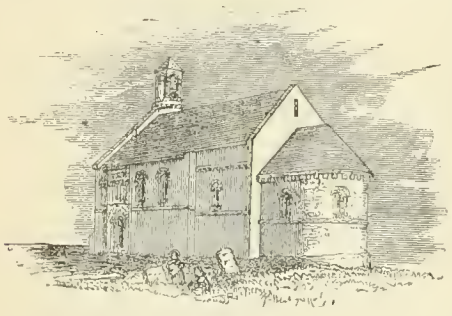
APSE (Lat. *apsis*), a semicircular recess usually placed at the east end of the choir or chancel of a romanesque, or what is commonly called in England an Anglo-Saxon or Anglo-Norman church. The origin of this peculiar termination to the choir is so curious, and has been so clearly established by recent German writers, that we shall endeavor to state it in a very few words. It is well known that the heathen structure from which the early Christians borrowed the form of their churches, was not the temple but the Basilica or public hall which served at once for a market-place and a court of justice. The Basilica, for the most part, was a parallelogram, at one of the shorter sides of which, opposite to the entrance, there was a raised platform destined for the accommodation of the persons engaged in, and connected with, the distribution of justice. This portion of the building was the prototype of the rounded choir, to which the name of *A.* was given, and which is still to be seen in so many of the Rhenish churches. For the prætor's chair which was placed in the center of this semicircular space, the altar was substituted; and the steps which led to the seat from which he dispensed justice, were destined henceforth to lead to the spot where the Fountain of all justice should be worshiped. Many A.'s are to be met with in English churches, an enumeration of which will be found in Mr. Parker's excellent Glossary

of Architecture. But as the structure is not only much more frequent, but continued to be used to a much later period on the continent, we shall describe it as it may still be seen in almost every little village along the banks of the Rhine. The lower part of the A. is there usually pierced by two or three round arched windows, often of irregular size and height, over which there is invariably an external gallery supported by pillars, in the form of which the rude idea of a Roman pillar is at once apparent; and the whole is joined to the end of the nave, which rises considerably above it, by a roof in the form of the segment of a cone.



Church at Schwartz, Rheindorf.

Where the churches are larger, there is a complete row of windows of the same rounded form, divided by pillars similar to those by which the gallery is supported, and under them frequently a line of arches of corresponding construction, whilst one or two small and irregular holes of the same form give a scanty light to the crypt beneath. Many of the smaller churches have no aisles; and the semicircular A. forms the termination of, or rather contains the chancel. The more complete specimens of the style, however, such as the minster at Bonn, afford—with the exception



Church of Dalmeny.

of the transepts and the towers, which are later additions—about the most perfected examples to be found on this side the Alps of the form of the Roman basilica, at first adapted to Christian uses. Several examples of the A. are to be seen in the earlier ecclesiastical structures of Scotland; as instances, we may mention the churches of Dalmeny and Kirkliston in Linlithgowshire, and of Leuchars in Fife.

A'PSIDES (Gr. *apsis*, connection), the two extreme points in the orbit of a planet—one at the greatest, the other at the least distance from the sun. The term A. is also applied in the same manner to the two points in the orbit of a satellite—one nearest to, the other farthest from, its primary; corresponding, in the case of the moon, to the perigee and apogee. A right line connecting these extreme points, is called the line of A. In all the planetary orbits, this line has no fixed position in space, but makes a forward motion in the plane of the orbit, except in the case of the planet Venus, where the motion is retrograding. The fact in the orbit of the earth gives rise to the anomalistic year (q. v.). This advancing motion of the line of A. is especially remarkable in the orbit of the moon, where it amounts to 40° 40′ 32″·2 annually, an entire revolution thus taking place in rather less than nine years.

A'PTEROUS INSECTS are insects without wings. In the Linnæan system, the *Aptera* form an order of insects; but more important distinctive characters being found to belong to the insects included in it, it is no longer retained as an order or principal division in the best entomological systems.

A'PTERYX (Gr. 'wingless') a bird of New Zealand which forms a family of the order to which the ostrich-like birds belong, as also the extinct dodo and æpyornis. The beak is long and slender; the legs and thighs strong; the claws of the three anterior toes are used as weapons of offence. The wings are merely rudimentary, and concealed by the loose, almost hair-like plumage. The feathers of the dorsal plumage are lanceolate, and composed externally of long, disunited filaments, the downy portion towards the root much developed. The wings have not the accessory plumage so highly developed in some of the struthious birds. The skin is very tough. Four species have been described; the largest (*Apteryx haasti*) stands about three feet high; the smallest (*A. Mantelli*) is about 23 inches from tip of beak to toe. The other two species are *A. Australis* (of which perhaps *A. Mantelli* is only a variety) and *A. Owcni*. Worms are the A.'s chief food, in search of which it deftly insinuates its flexible beak into the soft earth. The A. also eats insects, grubs, and some berries. It is nocturnal in its habits, and its nest is at the base of a hollow tree, or in deep holes in the ground. The native name is *kiwi-kiwi*.

Apteryx Australis.

A'PTHÆ are small vesicles formed of the superficial layer of a mucous membrane, elevated by fluid secreted by the latter. They are usually whitish in color, and the fluid may be serous or puriform. At the end of a few hours or days, the apthous vesicle bursts at its summit, and shrivels up, exposing an inflamed and painful patch of the mucous membrane. The most common site of A. is the mucous membrane of the lips and mouth, but they occasionally appear wherever mucous membrane approaches the skin.

Infants are liable to an apthous eruption termed *thrush* (q. v.). A. in adults are generally the consequences of fevers and other diseases, or a symptom of disturbance of the digestive system. In some cases of pulmonary consumption, they form a painful addition to the patient's sufferings. In ordinary cases of A., a preparation of borax, or some astringent wash, generally effects a rapid cure.

APU'LIA, a part of ancient Iapygia (so named after Iapyx, son of Dædalus), now includes the south-eastern part of Italy as far as the promontory of Leuca, and also the extreme peninsula of Calabria. Here, in ancient times, lived three distinct peoples—the Messapians or Salentini, the Peuceni, and the Dauni or Apulians. According to old Latin traditions, Daunus, king of the Apulians, when banished from Illyria, settled in these parts of Italy. Later traditions say that Diomedes, the Ætolian, with several other heroes returning from the Trojan war, came to Italy, and, in his war with the Messapians, was assisted by Daunus, but was afterwards deprived of his territory, and put to death. Roman poetry has preserved these old names; but in history, no mention is made of any king of A., though we find the names of its principal cities —Arpi, Luceria, and Canusium. The second Punic war was for some time carried on in A. In the present day A. (now styled PUGLIA) is merely the name of a geographical district, and has no political meaning. The whole territory, including the Neapolitan provinces, Capitanata, Terra di Bari, Terra d'Otranto, &c., is but a shadow of its former self, in the time of the Greek colonies, under Roman dominion, or even under the Normans, who took possession of it in 1043 A.D. The towns are depopulated, industry has disappeared, and commerce, once so flourishing, has passed away. Agriculture is in a very low condition, and the few roads are infested by banditti. The people are generally ignorant and superstitious, but deserve praise for their hospitality to travelers.

APU'RE, a river of the United States of Colombia and Venezuela, which rises in the East Andes, near lat. 7° N., and long. 72° W. After receiving the Portuguesa and the Guarico from the north, it joins the Orinoco, in lat. 7° 40′ N., and long. 66° 45′ W. It waters the towns Nutrias and San Fernando.

APU'RIMAC, a river of Peru, which, after a course of 500 miles, assumes the name of Tambo, and then of Ucayali, which finally joins the Tangaragua to form the Amazon. The A. proper rises to the north-west of the table-land of Lake Titicaca, receiving from it, however, no portion of its waters. Among the tributaries of the Amazon, it is one of the most southerly; while among them it approaches, perhaps the nearest to the Pacific. The A., from its source, drains the eastern face of the Andes, till it changes its name, as above, meanwhile receiving several considerable affluents, more especially the Villcamayo, from the opposite quarter. The A. and its feeders partake of the nature rather of mountain torrents than of navigable rivers; and even for traveling by land, their rocky and rugged banks are always difficult, and often impracticable. The valleys vary in climate and productiveness according to their elevation. The upper ones yield wheat and barley, and most of the fruits of Europe; while the lower, or at least the lowest ones, abound in sugar and cotton, plantains and pine-apples. The basin of the A., as a whole, is said to be the finest part of Peru, and to contain the largest proportion of native population—the best specimens apparently of the aboriginal civilization.

A'QUA FORTIS, literally, *strong water*, was the term used by the alchemists to denote nitric acid, and is still the commercial name of that acid.

A'QUA MARINE, a name sometimes popularly given to the Beryl (q. v.). Some green and blue varieties of topaz have also been styled A.

A'QUA REGI'NÆ, literally, *queen's water*, is a mixture of concentrated sulphuric acid (oil of vitriol) and nitric acid, or of sulphuric acid and nitre. Either mixture evolves much fumes, and may be used as a disinfectant, as similar mixtures are sold under the name of *everlasting disinfectants*.

A'QUA REGIS, or REGIA, literally, *royal water*, is the common name applied to a mixture of 1 part of nitric acid, and 2, 3, or 4 parts of hydrochloric acid. The general proportion is 1 to 2. The term aqua regia (royal water) was given to the mixture from the power it possesses of dissolving gold, which is the *king of the metals*.

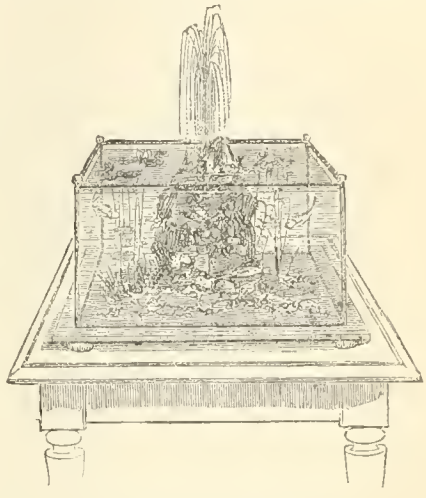
AQUA'RIUM, a tank or vessel containing either salt or fresh water, and in which either marine or fresh-water plants and and animals are kept in a living state. The name was formerly sometimes given to a tank or cistern placed in a hot-house, and intended for the cultivation of aquatic plants. The A., as now in use—originally *Vivarium* or *Aquavivarium*, and intended chiefly for animals, became extremely common about twenty years ago. From 1854 to 1860, there was a mania for these scientific toys: they became not only an aid to study, but a source of rational amusement, depending in principle upon the relations discovered by science between animal and vegetable life, and particularly upon the consumpt by plants, under the action of light, of the carbonic acid gas given forth by animals, and the consequent restoration to the air or water in which they live of the oxygen necessary for the maintenance of animal life. The A. must therefore contain both plants and animals, and in something like a proper proportion. Zoophytes, Annelides, Mollusca, Crustacea, and fishes may thus, with due care, be kept in health, and their habits observed. The water must be frequently *aerated*, which can be accomplished by taking up portions of it and pouring them in again from a small height.

The fresh-water A. is frequently provided with a fountain, which produces a continual change of water; but even where this is the case, the presence both of plants and animals is advantageous to the health of both. When sea-water cannot easily be procured for the Marine A., a substitute may be made by mixing with rather less than 4 quarts of spring water 3½ ounces of common table-salt, ½ ounce of Epsom salts, 200 grains troy of chloride of magnesium, and 40 grains troy of chloride of potassium. With care, the water may be kept good for a long time. No dead animal or decaying plant must be permitted to remain in it. Salt water, artificially prepared, is not fit for the reception of animals at once; but a few plants must first be placed in it, for which purpose some of the green algæ, species of Ulva and Conferva, are most suitable. The presence of a number of molluscous animals, such as the common periwinkle, is necessary for the consumption of the continually growing vegetable matter, and of the multitudinous spores (seeds), particularly of confervæ, which would otherwise soon fill the water, rendering it greenish or brownish, and untransparent, and which may be seen beginning to vegetate everywhere on the pebbles, or on the glass of the tank. In a fresh-water A., molluscous animals of similar habits, such as species of *Lymnæa* or *Planorbis*, are equally indispensable. For large aquaria, tanks of plate-glass are commonly used; smaller ones are made of bottle-glass or of crystal.

Simple form of an Aquarium.

Of course, the plants and animals with which the A. is stocked are various, according to taste and opportunities, or the desire to make particular kinds the subjects of careful and continued observation. Blennies, gobies, and gray mullets are perhaps the kinds of fish most commonly seen in marine aquaria; gold-fishes, sticklebacks, and minnows are frequent enough in fresh-water ones. These have the advantage of being more easily kept in good health than many other kinds, and a further recommendation is found in their small size, and in the fine colors of the gold-fish. The nests of sticklebacks are a subject of unfailing interest.

Crabs of various species, and actiniæ or sea-anemones, are very generally among the larger inmates of the A. Serpulæ contribute much both to its interest and beauty, as they spread out their delicate and finely tinted branchiæ from the mouth of their shelly tube, and withdraw within it, quick as thought, upon the slightest disturbance. Balani or acorn-shells are very beautiful objects when they are seen opening their summit-valves, and rapidly stretching out and retracting their little nets. Even periwinkles and limpets are interesting, particularly when they are watched by the aid of a magnifying-glass, as they feed upon the spores of the confervæ which have just begun to vegetate on the glass of the A., moving slowly along, with continual opening and shutting of the mouth, like cows at pasture, when the structure and motions of their mouths may be observed, and the singular beauty and brilliancy of colors never fails to command admiration. The use of a good magnifying lens adds greatly to the interest of the A., and zoophytes of exquisite forms and colors may be watched in the actual processes of life. The feeding of fishes, crabs, sea-anemones, &c., is a source of amusement, and it is interesting even to note how the inmates of the A. occasionally feed on their fellow-prisoners.



Aquarium, with Fountain for Aerating.

The idea of the A. seems to have originated from Mr. Ward's invention of the *cases* which bear his name (see WARDIAN CASES), and in which delicate ferns and other plants grow so well even in towns; but the late Sir John Graham Dalzell began to keep living marine animals in his house in Edinburgh so early as 1790, and continued to do so till the year 1850. Mr. Warrington appears to have been the first to make experiments on its practicability, and the name of Mr. Gosse is intimately associated with its early development and introduction to popularity as a scientific plaything. A Mr. Price also conducted some very successful experiments as to the balance of animal and vegetable life in aquaria. The largest aquaria in the world are those at Brighton and Hamburg, and there is also one of large dimensions at the Crystal Palace, Sydenham, as well as others in various parts of England, and in Scotland.

AQUA'RIUS, *the Water-bearer*, the eleventh sign of the zodiac, through which the sun moves in part of the months of January and February. It is also the name of a zodiacal constellation, whose position in the heavens may be found by producing a line in a southerly direction through the stars in the head of Andromeda and the wing of Pegasus.

AQUA'TIC plants and animals are those that live either wholly or partly in water. The term is very vaguely used, those plants being often called A. which grow in ponds, ditches, &c., although not only their inflorescence, but great part of their foliage, is above the surface of the water, as well as those which more completely belong to that element; and a similar latitude of meaning prevails with regard to animals. Few phanerogamous (or flowering) plants exist entirely under water, although there are a few, like the common *Zostera marina*, or Grass-wrack, which do so, and produce even their flowers in that condition; others, of which the greater part of the plant is usually under water, produce their flowers upon, or considerably above, its surface, as those of the genera *Valisneria*, *Anacharis* (q. v.), &c. The leaves, as well as the flowers, of many float upon the water, of which the water-lilies furnish well-known and beautiful examples; whilst in *Ranunculus aquatilis*, that exquisite ornament of our river margins, we have an instance of a kind not unfrequent, of great diversity between the lower leaves which remain submersed, and the upper leaves which float. Of cryptogamous plants, one great order, Algæ is exclusively A., and these seem

Aquatic plant.

adapted to perform under water all the functions of their life. A. plants are, in general, of less compact structure than is usual in other plants, and are thus lighter and better adapted for rising in their growth towards the surface of the water; in order to which also some of the algæ, as may be seen in more than one of the most common sea-weeds of our coasts, are provided with air-bladders of considerable magnitude.

All this is the more necessary, as plants completely A. have generally little firmness of stem, and if their weight made them fall to the bottom, would lie in a mass, as they do when withdrawn from the water, in which, however, they gracefully float, their flexibility of stem enabling them to adapt themselves to waves or currents which would destroy them if they were more rigid. So admirably are all things in nature harmonized.

Many animals, to a considerable extent A. in their habits, must not only breathe air, but are adapted for spending great part of their existence on dry land. Such are chiefly those that seek their food in the water. The peculiarities of structure by which they are fitted for wading, for swimming, for diving, and for remaining under water a longer time than other animals can, are very interesting and admirable. Even the fur of the beaver, the otter, the water-rat, and other animals of this description, is not liable to be drenched like that of the other quadrupeds; and the plumage of water-fowls exhibit a similar peculiarity. The feet of many are webbed, so as to enable them to swim with great facility; and to this the general form, as in water-fowls, likewise exhibits a beautiful adaptation. The webbed feet in some, of which the habits are most thoroughly A., as seals, assume the character of a sort of paddle, admirably fitted for use in the water, but by means of which they can only move very awkwardly on land. The forms of whales and fishes are remarkably adapted for progression in water; whilst, instead of the limbs by which other vertebrate animals are enabled to move upon the land or to fly in the air, their great organ of locomotion is the tail, or rather the hinder part of the elongated body itself, with the tail as the blade of the great oar, which all the principal muscles of the body concur to move. Remarkable provision is made in A. animals of the higher vertebrate classes for the maintenance of the requisite animal heat, by the character of the fur or plumage; a purpose which the blubber of whales also most perfectly serves. In the colder-blooded animals, where no such provision is requisite, the structure of the heart is accommodated to the diminished necessity for oxygenation of the blood; and although reptiles in their perfect state must breathe air, many of them can remain long under water without inconvenience. Fishes, and the many other animals provided with branchiæ or gills, breathe in the water itself, deriving the necessary oxygen, which in their case is comparatively little, from the small particles of air with which it is mingled. They cannot subsist in water which has been deprived of air by boiling. Some A. insects carry down with them into the water particles of air entangled in hairs with which their bodies are abundantly furnished.

AQUATI'NTA, a mode of etching on copper, by which imitations of drawings in Indian ink, bister, and sepia are produced. On a plate of copper a ground is prepared of black resin, on which the design is traced; a complicated series of manipulations with varnish and dilute acid is then gone through, until the desired result is attained. The process of A. has fallen into comparative disuse.

A'QUA TOFA'NA, a poisonous liquid which was much talked of in the south of Italy about the end of the 17th c. Its invention is still a matter of dubiety, but is ascribed to a Sicilian woman named Tofana, who lived first at Palermo, but was obliged, from the attention of the authorities having been attracted to her proceedings, to take refuge in Naples. She sold the preparation in small phials, inscribed 'Manna of St. Nicholas of Bari,' there being a current superstition that from the tomb of that saint there flowed an oil of miraculous efficacy in many diseases. The poison was especially sought after by young wives that wished to get rid of their husbands. The number of husbands dying suddenly in Rome about the year 1659, raised suspicion, and a society of young married women was discovered, presided over by an old woman named Spara, who had learned the art of poisoning from Tofana. Spara and four other members of the society were publicly executed. Tofana continued to live to a great age in a cloister, in which she had taken refuge, but was at last (1709) dragged from it, and put to the torture, when she confessed having been instrumental to 600 deaths. According to one account she was strangled; but others affirm that she was still living in prison in 1730.

The A. T. is usually described as a clear, colorless, tasteless, and inodorous fluid; five or six drops were sufficient to produce death, which resulted slowly and without pain, inflammation, or fever; under a constant thirst, a weariness of life, and an aversion to food, the strength of the person gradually wasted away. It is even stated that the poison could be made to produce its effect in a determined time, long or short, according to the wish of the administrator—a notion generally prevalent in those ages respecting secret poisoning. The most wonderful stories are told of the mode of preparing this poison; for example, the spittle of a person driven nearly mad by continued tickling was held to be an essential ingredient. Later investigations into the real nature of the A. T. lead to the belief that it was principally a solution of arsenic.

A'QUA VI'TÆ (Lat., water of life) is a common term applied to ardent spirits. During the alchemical epoch, brandy or distilled spirits was much used as a medicine, was considered a cure for all disorders, and even got the credit of prolonging life; and as Latin was the tongue employed in the conveyance of knowledge in those days, this restorer of health and prolonger of life was naturally christened A. V.

A'QUEDUCT (Lat. *Aquæ ductus*), an artificial course or channel by which water is conveyed along an inclined plain. When an A. is carried across a valley, it is usually raised on arches, and where elevated ground or hills intervene, a passage is cut, or, if necessary, a tunnel bored for it. Aqueducts were not unknown to the Greeks; but there are no remains of those which they constructed, and the brief notices of them by Pausanias, Herodotus, and others, do not enable us to form any distinct notion of their character. The aqueducts of the Romans were amongst the most magnificent of their works, and the noble supply of water which modern Rome derives from the three now in use, of which two are ancient, gives the stranger a very vivid conception of the vast scale on which the ancient city must have been provided with one of the most important appliances of civilization and refinement, when nine were employed to pour water into its baths and fountains.

The following are the names of the Roman aqueducts, chronologically arranged:

1. The *Aqua Appia*, begun by and named after the censor Appius Claudius about 313 B.C. It ran a course of between 6 and 7 miles, its source being in the neighborhood of Palestrina. With the exception of a small portion near the Porta Capena, it was subterranean. No remains of it exist.

2. *Anio Vetus*, constructed about 273 B.C. by M. Curius Dentatus. It also was chiefly underground. Remains may be traced both at Tivoli and near the Porta Maggiore. From the point at which it quitted the river Anio, about 20 miles above Tivoli, to Rome, is about 43 miles.

3. *Aqua Marcia*, named after the prætor Quintus Marcius Rex, 145 B.C., had its source between Tivoli and Subiaco, and was consequently about 60 miles long. The noble arches which stretch across the Campagna for some 6 miles on the road to Frascati, are the portion of this A. which was above ground.

4. *Aqua Tepula* (126 B.C.) had its source near Tusculum, and its channel was carried over the arches of the last-mentioned A.

5. *Aqua Julia*, constructed by Agrippa, and named after Augustus 34 B.C. Like the Tepulan, it was carried along the Marcian Arches, and its source was also near Tusculum. Remains of the three last-mentioned aqueducts still exist.

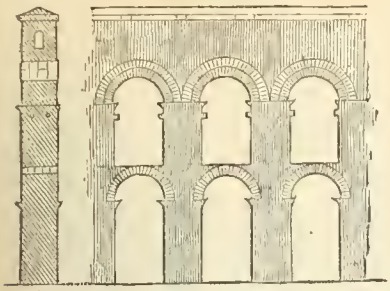
6. *Aqua Virgo*, also constructed by Agrippa, and said to have been named in consequence of the spring which supplied it having been pointed out by a girl to some of Agrippa's soldiers when in search of water. The Aqua Vergine, as it is now called, is still entire, having been restored by the Popes Nicholas V. and Pius IV. 1568. The source of the Aqua Virgo is near the Anio, in the neighborhood of Torre Salona, on the Via Collatina, and about 14 miles from Rome. The original object of this A. was to supply the baths of Agrippa; its water now flows in the Fontana Trevi, that of the Piazza Navona, the Piazza Farnese, and the Barcaccia of the Piazza di Spagna. The water of the Aqua Virgo is the best in Rome.

7. *Aqua Alsietina*, constructed by Augustus, and afterwards restored by Trajan, and latterly by the popes. This A., now called the Aqua Paola, is situated on the right bank of the Tiber, and supplies the fountains in front of St. Peter's and the Fontana Paola on the Montorio. Its original object was to supply the Naumachia of Augustus, which was a sheet of water for the representation of sea-fights.

8. *Aqua Claudia*, commenced by Caligula and completed by Claudius, 51 A.D. A line of magnificent arches which formerly belonged to this A. still stretches across the Campagna, and forms one of the grandest of Roman ruins. It was used as a quarry by Sextus V. for the construction of the Aqua Felici, which now supplies the fountain of Termini, and various others in different parts of the city.

9. *Anio Novus*, which was the most copious of all the Roman fountains, though inferior to the Marcia in the solidity of its structure; it was also the longest of aqueducts, pursuing a course

of no less than 62 miles. By the two last-mentioned aqueducts, the former supply of water was doubled. In addition to the aqueducts already mentioned, there was the Aqua Trajana, which may, however, be regarded as a branch of the Anio Novus, and several others of later construction, such as the Antoniana, Alexandrina, and Jovia, none of which were to be compared with the older ones in extent and magnificence.



Section.

Aqua Alexandrina.

Nor was it for the uses of the capital alone that aqueducts were constructed. The A. of Trajan, at Civita Vecchia, which conveys the water a distance of 23 miles, and that in the vicinity of Marzana, near Verona, with others that might be mentioned, still attest the existence of aqueducts in the smaller towns of Italy in Roman times. Even during the unpromising period which succeeded, the habit of their construction was not abandoned, that of Spoleto having been built by the Lombard Duke Theodolapius in 604. The extraordinary A. by which the fountain of Siena is supplied, is said to have occupied two centuries in building; and the modern A. of Leghorn, which is not unworthy of the Roman models after which it was designed, is surpassed in magnificence by that of Pisa, with its thousand arches. In the more distant provinces which fell under the Roman power, aqueducts were likewise constructed—at Nicomedia, Ephesus, Smyrna, Alexandria, Syracuse, and in many of the towns in Gaul and in Spain. At Merida there are the remains of two aqueducts, of one of which there are thirty-seven piers still standing, with three tiers of arches.

But the most magnificent structure of this class in Spain, is the A. of Segovia, in Old Castile, for which Spanish writers claim an antiquity beyond that of the Roman dominion; but which, there is reason to believe, belongs to the time of Trajan. At Evora, in Portugal, there is likewise an A. in good preservation, with a *castellum* or reservoir at its termination in the city, consisting of two stories, the lower one being decorated with pillars. But of all the provincial aqueducts, that at Nismes, in Provence, is at once the most remarkable and the best preserved. The following description of it, which we transcribe from Mr. Murray's excellent Hand-book for France, will convey to the reader a very vivid conception not only of this A. in particular, but of the very interesting class of works to which it belongs. 'It consists of three rows of arches, raised one above the other, each one smaller than the one below it; the lowest of six arches, the center tier of eleven, and the uppermost of thirty-five; the whole in a simple if not a stern style of architecture, destitute of ornament. It is, by its magnitude, and the skilful fitting of its enormous blocks, that it makes an impression on the mind. It is the more striking from the utter solitude in which it stands—a rocky valley, partly covered with brushwood and greensward, with scarce a human habitation in sight, only a few goats browsing. After the lapse of 16 c., this colossal monument still spans the valley, joining hill to hill, in a nearly perfect state, only the upper part, at the northern extremity, being broken away. The highest range of arches carries a small canal, about 4½ feet high, and 4 feet wide, just large enough for a man to creep through, still retaining a thick lining of Roman cement. It is covered with stone slabs, along which it is possible to walk from one end to the other, and to overlook the valley of the Gardon. The height of the Pont du Gard is 188 feet, and the length of the highest arcade 873 feet. Its use was to convey to the town of Nismes the water of two springs, 25 miles distant. . . . The conveyance of this small stream was the sole object and use of this gigantic structure, an end, which would now be attained by a few iron water-pipes.' Neither the date nor the builder of the Pont du Gard is known with certainty, but it is ascribed to Agrippa, the nephew of Augustus; a conjecture which is rendered probable by the fact of his having restored the Appian, Marcian, and Anienian, and constructed the Julian A. at Rome. The importance which the Romans attached to their aqueducts may be gathered from the fact, that special officers, invested with considerable authority, and like all the higher officials, attended by lictors and public slaves, were appointed for their superintendence. Under the orders of these 'guardians of the waters,' we are told that, in the time of Nerva and Trajan, about 700 architects and others were employed in attending to the A. These officials were divided into various classes, and known by different names, according as their duties related to the care of the course of the A., the Castella or reservoirs at its termini, the pavement of the channel, the cement with which it was covered, and the like.

The construction of aqueducts in recent times is comparatively rare, water being now generally conveyed in pipes; but two instances are worthy of notice—the *Lisbon* A., and the *Croton* at New York. The former, completed in 1738, is about 3 leagues in length; near the city, it is carried over a deep valley for a length of 2400 feet, by a number of bold arches, the largest of which has a height of 250 feet, and a span of 115. The Croton A., which conveys the waters of the Croton river for a distance of 38 miles to the city of New York, is one of the greatest undertakings of modern times. It was commenced in 1837, and finished in 1842, and is calculated to discharge upwards of 60,000,000 gallons in 24 hours. As the magnificence of aqueducts depends upon the height and number of arches requisite to carry them across valleys, it may give some idea of that under consideration when it is stated that Harlem River is crossed by fifteen arches, seven of which are of 50 feet span, and eight of 80 feet, the greatest height being 150 feet from the foundation to the top of the mason-work. See AQUEDUCT in AM. SUPP.

A'QUEOUS HUMOR is the fluid which occupies the space in the eye between the back of the cornea and the front of the lens, which, in fœtal life, is divided into an *anterior* and *posterior* chamber by the membra pupillaris (q. v.), and in adult life by the iris. It consists of water, with, according to Berzelius, about a fiftieth of its weight made up of chloride of sodium and extractive matters held in solution.

Anatomists are not agreed as to the spring of this watery secretion, and are inclined to doubt the existence of a special secreting membrane, which used to be taken for granted. However, a layer of delicate epithelial cells, which exist at the back of the cornea (q. v.), is probably concerned in its formation. It is rapidly re-secreted if allowed to escape by any wound in the cornea, and in some cases is formed in such quantity as to cause dropsy of the eye (*hydrophthalmia*).

A'QUEOUS ROCKS. In Geology, every layer which forms a portion of the solid crust of the earth is called a rock, it matters not whether its particles are incoherent, like soil or sand, or compacted together, like limestone and sandstone—to all alike, irrespective of popular usage, the geologist applies the term *rock*. In this wide sense, the rocks of the earth's crust are either igneous (q. v.) or sedimentary. These sedimentary rocks have an aqueous origin, with the exception of a very limited number, like drift-sand, which are brought into their present position by the action of the wind. Unlike the igneous rocks, whose particles have assumed their present form in the position they occupy, the materials of the A. R. have evidently been brought from a distance. They owe their origin to some older rock, whose decomposition or destruction has afforded the materials. The parent rock can often be identified. Its distance is indicated by the condition of the materials, whether they are rounded and water-worn, or angular and shingly.

The agents now at work, and which have been active in past geological ages, rubbing down and transporting the materials from which these rocks are formed, are the following: 1. *The sea*, destroying the rocks and cliffs, and beaches which form its boundary, and carrying off the eroded materials to form new rocks below the level of the sea. 2. *Rivers*, including the action of their smallest tributary rills, and even of the drops of rain, for these abrade and carry off the almost imperceptible particles from the surface where they fall; and when united, they form the rill with its suspended sediment, and these again unite to form the river, which in its course not only retains what it has got, but scoops up more from its own bed, and carries all to the sea or lake, to deposit it there as a new stratum. It is difficult to estimate the influence of this agency. Sir Charles Lyell calculates that the Nile annually deposits in the Mediterranean 3,702,758,400 cubic feet of solid matter. 3. *Glaciers and icebergs*. These enormous moving masses of ice are not only loaded with rock-fragments, which are deposited as the ice melts, but are ever abrading the rocks over which they pass, and thus supply materials to form new layers. 4. Several stratified rocks have an evidently *organic origin*, such as chalk, and some limestones chiefly composed of animal remains, and coal consisting of vegetable carbon; but even these have been influenced in their formation by water so much as to justify us in classifying them with A. R. 5. The same remark applies to rocks which have been *precipitated from a fluid* with which the materials existed in chemical combination, as has been the case with beds of salt, gypsum, and calcareous tufa.

As the result of these various actions, we have a series of rocks which, from their composition, may be classed as Arenaceous, Argillaceous, Calcareous, Carbonaceous, Saline, and Silicious. We must refer to these terms for the descriptions of the various rocks included under them.

The arrangement of the A. R. depending on their different ages, is of more importance in modern geology than that depending on their internal constitution. When a section of the earth's crust is examined, it is found to be composed of a series of layers which have been produced in succession. Comparing this with sections in other districts, it is noticed that there is a regularity

in the several parts; for beds of the same structure are found in different localities, and these occupy the same relative position to the adjacent beds. A number of observations have shown that the crust of the earth is composed of a *regular* series of earthy deposits formed one after another, during successive periods of time. This general induction forms the basis of the following classification. For the description of the included strata we must again refer to the names of the different divisions:

I. Tertiary or Kainozoic Epoch—1. Superficial Deposits or Recent Period; 2. Pleistocene Period; 3. Pliocene or Upper Tertiary Period; 4. Miocene or Middle Tertiary Period; 5. Eocene or Lower Tertiary Period.

II. Secondary or Mesozoic Epoch—6. Cretaceous Period; 7. Oolitic Period; 8. Triassic Period.

III. Primary or Palæozoic Epoch—9. Permian Period; 10. Carboniferous Period; 11. Devonian or Old Red Sandstone Period; 12. Silurian Period; 13. Cambrian Period.

AQUIFOLIA'CEÆ, a natural order of dicotyledonous or exogenous plants, of which the common holly (q. v.) is the best known example, and the only species that is a native of Europe. The order, however, contains more than one hundred species, the greater part of which are natives of America, and many of them belong to the tropical and subtropical parts of it. The species are all evergreen trees or shrubs, with simple, leathery leaves, and without stipules. The flowers are small and axillary, with 4—6 sepals, and a 4—6-parted corolla, into which the stamens are inserted, alternating with its segments. The ovary is fleshy and superior, with two or more cells, a solitary anatropal pendulous ovule in each cell, the cells generally becoming bony as distinct *stones* in the fruit, which is fleshy. The order is allied to *Rhamnaceæ*, *Celastraceæ*, and *Ebenaceæ*. The most interesting species belong to the genus *Ilex*, or Holly (q. v.).

AQUILA. See Eagle.

A'QUILA, the capital of the Italian province of the same name, situated on the Pescara, near the loftiest of the Apennines, with a population of 14,000, ranks as a fortified town of the fourth class, though its citadel is its only strong point. A. was built by the emperor Frederic II. from the ruins of the ancient *Aniternum*, a town of the Sabines, and the birthplace of Sallust the historian. In 1703 it was almost destroyed by an earthquake, in which 2000 persons perished. A. is a bishop's see, has civil and criminal courts, and a Lyceum, and is considered one of the best built towns in the kingdom. In 1841, much political disturbance took place here, and several of the inhabitants were imprisoned and executed in consequence. Altogether, public feeling in this town and province is far more liberal than in most other parts of the kingdom.

A'QUILA, Ponticus, a celebrated translator of the old Testament into Greek, born at Sinope. He flourished about the year 130 A. D., is said to have been a relation of the Emperor Hadrian, and to have been first a Pagan, then a Christian, and finally a Jew; submitting in his last conversion to the peculiar religious ceremony of circumcision. His translation of the Old Testament—which appears to have been undertaken for the benefit of his Hellenized countrymen—was so *literal*, that the Jews preferred it to the Septuagint, as did also the Judaizing sect of Christians, called Ebionites. Only a portion of the work remains, which has been edited by Montfaucon and others.

AQUILARIA'CEÆ, a natural order of dicotyledonous or exogenous plants, containing only about ten known species, all of which are trees with smooth branches and tough bark, natives of the tropical parts of Asia. The leaves are entire; the perianth leathery, turbinate, or tubular, its limb divided into four or five segments; the stamens usually ten; the filaments inserted into the orifice of the perianth; the ovary two-celled, with two ovules; the stigma large; the fruit a 2-valved capsule, or a drupe. The order is chiefly interesting as producing the fragrant wood called Aloes Wood (q. v.).

AQUILEGIA, See Columbine.

AQUILE'JA or AGLAR (earlier, Velia or Aquila), is a small town in Austria, at the head of the Adriatic, 22 miles W. N. W. of Trieste. Pop. about 2000. It is now sunk in utter insignificance, possessing no trade or public buildings of any note, except its cathedral; but in the time of the Roman emperors, it was one of the most important places north of the metropolis. Its commerce was flourishing, for though 8 miles distant from the sea, vessels could reach it by canals connecting it with the rivers in its vicinity. It was both the central point of the transit-trade between the north and south of Europe, and the key of Italy against the barbarians. Founded by a Roman colony in 181 B.C., it became a favorite residence of Augustus; and in 168 A.D., was so strongly fortified by Marcus Aurelius, as to be considered the first bulwark of the empire on the north. It was called *Roma Secunda*, the Second Rome. Here the Emperor Maximin perished; and in the vicinity Constantius lost his life in a battle against his brother Constans. When the town was destroyed by Attila (452), it had 100,000 inhabitants. It never recovered, although it received some ecclesiastical honors, but has continued slowly dwindling down into deeper obscurity and wretchedness. There are numerous remains of its former splendor. Councils were held at A. in 381, 558, 698, and 1184 A.D.

AQUI'NAS, Thomas, or THOMAS of AQUINO, one of the most influential of the scholastic theologians, was of the family of the Counts of Aquino, in the kingdom of Naples, and was born in the Castle of Rocca Secca in 1224. He received the rudiments of his education from the Benedictine monks of Monte-Casino, and completed his studies at the university of Naples. A strong inclination to philosophical speculation determined the young nobleman, against the will of his family, to enter (1243) the order of Dominicans. In order to frustrate the attempts of his friends to remove him from the convent, he was sent away from Naples with the view of going to France; but his brothers took him by force from his conductors, and carried him to the paternal castle. Here he was guarded as a prisoner for two years, when, by the help of the Dominicans, he contrived to escape, and went through France to the Dominican convent at Cologne, in order to enjoy the instructions of the famous Albertus Magnus (q. v.). According to another account, he owed his release from confinement to the interference of the emperor and the pope.

At Cologne he pursued his studies in such silence, that his companions gave him the name of the 'Dumb Ox.' But Albert, his master, is reported to have predicted, 'that this ox would one day fill the world with his bellowing.' Thoroughly imbued with the scholastic, dialectic, and Aristotelian philosophy, he came forward, after a few years, as a public teacher in Paris. His masterly application of this philosophy to the systematizing of theology, soon procured him a distinguished reputation. It was not, however, till 1257, that A. obtained the degree of doctor, as the university of the Sorbonne was hostile to the mendicant monks. He vindicated his order in his work *Contra Impugnantes Dei Cultum et Religionem;* and, in a disputation in presence of the pope, procured the condemnation of the books of his adversaries. He continued to lecture with great applause in Paris, till Urban IV., in 1261, called him to Italy to teach philosophy in Rome, Bologna, and Pisa. Finally, he came to reside in the convent at Naples, where he declined the offer of the dignity of archbishop, in order to devote himself entirely to study and lecturing. Being summoned by Gregory X. to attend the General Council at Lyon, he was surprised by death on the way, 1274, at Fossanuova, in Naples. According to a report, he was poisoned at the instigation of Charles I. of Sicily, who dreaded the evidence that A. would give of him at Lyon.

Even during his life A. enjoyed the highest consideration in the church. His voice carried decisive weight with it; and his scholars called him the 'Universal,' the 'Angelic Doctor,' and the 'Second Augustine.' A general chapter of Dominicans in Paris made it obligatory on the members of the order, under pain of punishment, to defend his doctrines. It was chiefly the narratives of miracles said to have been wrought by A. that induced John XXII., in 1323, to give him a place among the saints. His remains were deposited in the convent of his order at Toulouse. Like most of the other scholastic theologians, he had no knowledge of Greek or Hebrew, and was almost equally ignorant of history; but his writings display a great expenditure of diligence and dialectic art, set off with the irresistible eloquence of zeal.

His chief works are—a *Commentary on the Four Books of Sentences of Peter Lombard*, the *Summa Theologiæ*, *Quæstiones Disputatæ et Quodlibetales* and *Opuscula Theologica*. He gave a new and scientific foundation to the doctrine of the church's treasury of works of supererogation, to that of withholding the cup from the laity in the communion, and to transubstantiation. He also treated Christian morals according to an arrangement of his own, and with a comprehensiveness that procured him the title of the 'Father of Moral Philosophy.' The definiteness, clearness, and completeness of his method of handling the theology of the church, gave his works a superiority over the text-books of the earlier writers on systematic theology. His *Summa Theologiæ* is the first attempt at a complete theological system. Accordingly, Pius V., to whom we owe the publication of the completest collection of A.'s works (18 vols., Rome, 1570; a newer but less trustworthy ed., 23 vols., Paris, 1636—41), ranks him with the greatest teachers of the church. In his philosophical writings, the ablest of which is his *Summa Fidei Catholicæ contra Gentiles*, he throws new light over the most abstract truths. The circumstance of A. being a Dominican, and boasted of by his order as their great ornament, excited the jealousy of the Franciscans against him. In the beginning of the 14th c., Duns Scotus (q. v), a Franciscan, came forward as the declared opponent of the doctrines of A., and founded the philosophico-theological school of the Scotists, to whom the *Thomists*, mostly Dominicans, stood opposed. The Thomists leaned in philosophy to Nominalism (q. v.), although they held the abstract form to be the essence of things, they followed the

doctrines of Augustine as to grace, and disputed the immaculate conception of the Virgin. The Scotists, again, inclined to realism (q. v.), and to the views of the Semipelagians, and upheld the immaculate conception.

AQUITA'NIA, the Latin name of a part of Gaul, originally including the country between the Pyrenees and the Garonne, peopled by Iberian tribes. Augustus, when he divided Gaul into four provinces, added to A. the country lying between the rivers Garonne and Loire. Afterwards, A. passed into the hands—first, of the West Goths, and then of the Franks; and during the Merovingian dynasty, became an independent duchy. Though subjugated by Charlemagne, the duchy again claimed independence under the weak monarchs of the Carlovingian dynasty. In 1137, it was united to the crown of France by the marriage of Louis VII. with Eleanor, heiress of A. In 1152, A. became an English possession through the marriage of Henry II. with Eleanor, whom Louis had divorced, and a long series of disputes took place between England and France respecting A., which was at length ultimately united to the crown of France by Charles VII. in 1451.

ARABESQUE (Fr.), means merely *after the Arabian manner*; and, so far as etymology is concerned, might therefore be general in its application. In practice, however, it is used to characterize a peculiar kind of fantastic decoration commonly employed in conjunction with architecture, and which the Spanish Moors are supposed to have introduced into modern Europe. But the species of enrichment to which this term is now applied, was extensively employed both by the Greeks and Romans, the latter in particular being masters of the style. The Egyptians, from whom the Moors probably derived their original notions of this and other forms of art, also employed it in enriching their monumental decorations. But the A. of the Moors differed from that of the Egyptians in entirely excluding the figures of animals, the representation of which was forbidden by the Mohammedan religion, and confining itself entirely to the foliage, flowers, fruit, and tendrils of plants and trees, curiously and elaborately intertwined. This limitation of the field of A. was again departed from when the decorations were discovered on the walls of the baths of Titus, in the time of Leo X.; and more recently those in the houses at Herculaneum and Pompeii came to form the models of imitation, and the modern A. consists usually of combinations of plants, birds, and animals of all kinds, including the human figure, and embracing not only every natural variety, but stepping without hesitation beyond the bounds of nature. The freedom with which it admits the fantastic is, indeed, the leading peculiarity of A.; and as it is found in some form amongst every people who have attempted to give a visible representation of their fancies, it is spoken of by F. Schlegel as 'the oldest and original form of fancy.' The arabesques with which Raphael adorned the galleries of the Vatican, and which he is said to have imitated from those which he had been instrumental in discovering in the baths of Titus, are at once the most famous and the most beautiful which the modern world has produced. Arabesques are usually painted, though the term is also applied to sculptural representations of similar subjects in low relief.

Arabesque Panel. From the Mosque at Cordova.

ARABAGI'R, or ARABKIR (anc. *Anabrace*), a town of Asiatic Turkey, in the vilayet of Sivas, in a mountainous and rocky district, not far from the Euphrates, and 150 miles south-south-west from Trebizond. It contains a pop. of about 30,000 nearly one-fourth being Armenians, the other three-fourths Turks. It is to the enterprise and industry of the Armenians that the town owes its prosperity. It is specially noted for the manufacture of goods from English cotton yarn. The neighboring country is inhabited by Turcomans.

ARA'BIA—called by the inhabitants, Jezirat-al-Arab (the peninsula of A.); by the Turks and Persians, Arabistân—is the great south-western peninsula of Asia, and is situated 12° 40′—34° N. lat., and 32° 30′—60° E. long. Its greatest length from N.W. to S.E. is about 1800 miles; its mean breadth, about 600; its area, 1,230,000 square miles; and its population conjectured to be not much above 5,000,000. It is bounded on the N. by the highlands of Syria, and the plains of Mesopotamia (or by the line from El Arish on the Mediterranean to the Euphrates delta); on the E., by the Persian Gulf and the Gulf of Oman; on the S., by the Arabian Sea; and on the W., by the Red Sea and the Suez Canal. Midway between Mecca and Medina runs the tropic of Cancer. Ptolemy is supposed to be the author of the famous threefold division into *Arabia Petræa*, i. e., the Arabia of the city of Petra, in the N.W.; *Arabia Felix* (an incorrect translation of Yemen, which does not signify 'happy,' but the land lying to the *right* of Mecca), along the W. and S.W. coasts; and *Arabia Deserta*, in the interior. The more precise divisions are: the *Sinaitic Peninsula* (see SINAI), between the Gulfs of Suez and Akaba; the *Hedjaz* (Land of Pilgrimage), the larger and northern strip to the E. of the Red Sea; *Yemen*, the southern and smaller strip to the E. of the Red Sea; *Hadramaut*, the region along the southern coast; *Oman*, the extreme south-eastern end of the peninsula, as large as England and Wales; *El-Hasa*, along the Persian Gulf; *Nejd*, the Central Highlands of Arabia.

In shape, A. is an irregular parallellogram, broadest at the southern end; in character, it is mainly African. The vast central plateau rises from a height of 2500 feet in the north to 7000 feet in the south-west, and is bounded by western and southern mountain chains, the former attaining, to the south of Mecca, a height of 8500 feet. Between the mountains and the sea is a low hot strip of land partially fertile, of varying width. There is a desert in the north of the interior, the mountainous country of Nejd near the very center, and to the south of Nejd another very sterile sandy desert. Hedjaz and Yemen extend from the Red Sea indefinitely towards the interior, and consist partly of the *Tehama*, or low country, along the sea, and partly of the mountain district beyond. Mecca and Medina are in Hedjaz. Yemen is on the whole well watered, has rich and fertile valleys, and contains one-fifth of the whole population of Arabia. Yemen possesses two very important commercial towns, Mocha and Loheia, situated on the coast of the Red Sea. Hadramaut is little known, but resembles the Hedjaz in character. Oman is mainly mountainous, is partly very fertile, and posssesses the good harbor of Muscat. It has some manufactures of cotton, silk, and arms. Large portions of A. are perfectly arid, but the more fertile portions are so extensive as to constitute two-thirds of the total area: one-third of the whole may be accounted desert and uninhabitable.

Our knowledge of the interior of A. is still very imperfect in detail. The largest portion of it lies in that great desert zone which stretches from the shores of the Atlantic to those of the Northern Pacific. Nejd, the northern highland or central plateau of A., is a compact settled district, culminating in the crescent-shaped Jebel Toweyk, which is intersected by numerous valleys, roaring torrents during the rains, but dry depressions at other times. North of Nejd, and separated from it by a narrow arm of Nefud, or the northern desert of A., is the smaller plateau of Jebel Shomer, crossed by the ranges of Jebel Aja and Jebel Selma. The northern desert, partly stony, and partly a burning expanse of red sand, is thinly sprinkled over with oases of wells and grass, serving as halting-places for the caravans of merchants or pilgrims. The oasis of *Jauf*, 60 miles long by 10 miles broad, contains three flourishing villages. *Dahna*, the southern and main desert of A., extends from Nejd and the Hadramaut coast range, and has never been explored by any European. It is, however, an almost absolutely sterile sand-waste. See MUSCAT, ZANZIBAR.

Politically, Hedjaz, Yemen, and El Hasa are really three Turkish provinces; the Sinaitic Peninsula is in Egyptian hands; England exercises much influence in Hadramaut through her possession of Aden; the Sultan of Oman is practically independent, and in alliance with England; Nejd, the seat of the once powerful Wahabi State (see WAHABIS), may be said to be independent, though the Emir of Shomer or Shammar, its most powerful potentate, pays a small annual tribute to the Sherif of Mecca, in recognition of Turkish supremacy.

A. has, on the whole, an African climate. Though surrounded on three sides by the sea, its chains of hills exclude in a great measure the modifying influence of currents of air from the ocean. In several parts of A. hardly a refreshing shower falls in the course of the year, and vegetation is almost unknown: in other sultry districts, the date-palm is almost the only proof of vegetable life. Over large sterile tracts hangs a sky of almost unbroken serenity. The short rainy season which occurs on the west coast, during our summer months, fills periodically the *wadis* (hollow places) with water, while slight frosts mark the winters in the center and north-east. During the hot season, the Simoom (q. v.) blows, but only in the northern part of the land. The terraced districts are more favorable to culture, and produce wheat, barley, millet, palms, tobacco, indigo, cotton, sugar, tamarinds, excellent coffee, senna, and many aromatic and spice-plants, as balsam, aloe, myrrh, frankincense, &c. A. is destitute of forests; but has vast stretches of desert grass fragrant with aromatic herbs, and furnishing admirable pasturage for the splendid breed of horses. Coffee, one of the most important exports, is an indigenous product both of A. and Africa.

In the animal kingdom, an African character prevails generally. Sheep, goats, and oxen satisfy the immediate domestic and personal necessities of the inhabitants, to whom the camel and horse are trusty companions in their far wanderings. Gazelles and ostriches frequent the oases of the deserts, where the lion, panther, hyena, and jackal hunt their prey. Monkeys, pheasants, and doves are found in the fertile districts, where flights of locusts often make sad devastation. Fish and turtle abound on the coast.

The noble breed of Arabian horses has been cultivated for several thousand years; but the most characteristic of all animals in the peninsula is the camel, which has been both poetically and justly styled 'the ship of the desert.' It may be regarded as an Arabian animal, for it seems to be proved that it is not a native of Africa, but has migrated from the peninsula with its master. The camel is not found among the figures of animals in the ancient Egyptian paintings on walls, nor does it appear to have been known to the Carthaginians. The breed of Oman is celebrated for its beauty and swiftness. Among the minerals of A. may be mentioned—iron, copper, lead, coal, basalt and asphaltum, and the precious stones, emerald, carnelian, agate, and onyx. Pearls are found in the Persian Gulf.

But the most interesting feature of the peninsula is its ancient and peculiar population. The Arab is of medium stature, muscular make, and brown complexion. Earnestness and lofty pride look out of his glowing eyes; by nature he is quick, sharp-witted, imaginative, and passionately fond of poetry. Courage, temperance, hospitality, and good faith are his leading virtues; but these are often marred by a spirit of sanguinary revenge and rapacity. His wife keeps the house and educates the children.

Arabian life is either *nomadic* or *settled*. The wandering tribes, or Bedouins, who have, however, their allotted winter and summer camping-grounds, and a strong home-feeling, entertain notions of the rights of property differing seriously from those regulating the West, yet even their most marauding tribes are not without a traditional code of law and honor. The settled tribes, styled Hadesi and Fellahs, are despised by the Bedouins, who, breathing a pure air, and living on a simple diet, are physically and morally their superiors. Arabia is the anti-industrial central point in the world;' for here centuries pass away without any improvement save what has been introduced, almost compulsorily, by foreigners. The export of coffee, dates, figs, spices, and drugs, though still considerable, is said to be only a shadow of the old commerce which existed before the circumnavigation of Africa, or when Aden was in its prime, and the Red Sea was the great commercial route. A. has few manufactures, but carries on a transit-trade in foreign fabrics, besides importing these to some extent for its own necessities.

Education is mostly confined to that within the household, where, however, a boy is instructed in reading and writing, in grammar, history, and poetry, and where he is trained to habits of politeness and self-restraint. In the few higher public schools, writing, grammar, and rhetoric compose the whole curriculum. The government is patriarchal, and chief men of the various tribes have the title of Emir, Sheik, or Imaum. Their function appears limited to leading the troops in time of war, to levying tribute, and to the administration of justice. A spirit of liberty in the people moderates the authority of their chieftains; but instances of extreme despotism have not been unfrequent both in early and modern times.

History.—The history of A. before the time of Mohammed is involved in mystery, and has little interest, on account of its want of connection with the world's general progress. As indicative of the African origin of the Arabs, the following particulars have been specified: the writings *Hamasa* and *Kitab-el-aghanee,* which represent the 'pure' Arabs as having first settled on the extreme S.W. of the Peninsula, thence spreading N. and E.; the name Himyar (dusky) which is applied to the ruling class, sometimes to the entire nation; the Himyaritic language, which, as preserved in some proper names, &c., shows decided African affinities; the kinship between the pre-Islamitic institutions of Yemen and those of the historic Egyptians, and even of the modern Abyssinians; the African bearing of the physique and manners of the pure-blooded Arabs; the facility of marriage between the southern Arabs and the Africans, and the fecundity of such unions. The earliest trustworthy records present to us an Arabia of different kingdoms and federal governments, clustered round the desert interior, and all more or less under the rule of a race of southern origin. Yemen, the most prosperous of these, must, as the fragmentary native records which have come down to our time attest, have enjoyed a considerable degree of civilization, with an extensive commerce, a poetic literature, and practical arts; its institutions showing some affinity to those of the Nile Valley, on the other side of the Red Sea. The Himyaritic dynasty long ruled in Yemen; and *Himyaritic* is still used of the relics of the oldest south Arabian tongue. Hira, in the north-easterly province of Arabian Irak, on the other hand, assimilated somewhat to the neighboring Persia; Ghassan, in the N.W., again, approaching more to a Byzantine complexion. In the fifth c. we find the Koreyah clan, from which Mohammed (q. v.) sprung, predominating in A., and masters of the sacred shrine of Káabeh within the precincts of Mecca, a possession giving them not only a religious pre-eminence in the peninsula, but the disposal of the accumulated offerings of gold, silver, jewels, &c., in the temple, a fund of wealth which they increased by commerce on the Red Sea coast. In the pre-Islamite times, too, was held the great annual fair of Okad, in a plain of the same name, and at a day's journey from Mecca; a fair at which horse-races, gymnastic sports, poetic contests, and other amusements enlivened the seriousness of trade transactions.

In the reign of Augustus, Ælius Gallus, the Roman prefect of Egypt, at the head of a large army unsuccessfully attempted the reduction of Yemen to the Roman Empire. In 529, however, Yemen was conquered by a large Abyssinian army, and was kept in subjection to the Ethiopians for seventy-six years subsequent to that date. Christianity found an early entrance into Arabia. The Jews, in considerable numbers, migrated into A. after the destruction of Jerusalem, and made many proselytes, especially in Yemen. This diversity of creeds in the peninsula was favorable to the introduction of the doctrine of Mohammed, which forms the grand epoch in Arabian history, and brings it into close connection with the general history of civilization. Now, for the first time, the people of A. became united under one sceptre and one creed, and powerful enough to erect new empires in the three quarters of the world; in Palestine, Mesopotamia, and Persia; in Egypt and the north of Africa; in Spain. The dominion of the Arabs, from the time of Mohammed to the fall of the Califat of Bagdad in 1258, or even to the expulsion of the Moors from Spain in 1492, is an important period in the history of civilization. (See the articles MOORS, CALIF.) But the movements which had such great effects on the destinies of other nations, left the peninsula itself in an exhausted condition. Then followed the subjugation of Yemen by the Turks in the sixteenth century; their expulsion in the seventeenth century; the dominion of the Portuguese over Muscat, 1508—1659; the conquests of Oman, and the temporary victories gained by the Persians at the close of the sixteenth century; and, lastly, the appearance of the Wahabis (q. v.) (1770). The progress of the latter was interrupted by Mehemet Ali (q. v.), the Pasha of Egypt, who subjugated the coast-country of Hedjaz, with some parts of the coast of Yemen. The events of the year 1840, in Syria, compelled Mehemet, however, to resign all claims upon the territories lying beyond the Red Sea. Since then, the political conditions have come to be as described above; see WAHABIS. Arab influences are, of course, still powerful beyond the limits of the peninsula, in many parts of Africa, and especially in North Africa and Egypt.

ARA'BIAN ARCHITECTURE. So inseparable is the connection between architecture and religion, that it may be stated as a general rule that no sooner is a religion engendered than it finds expression in new architectural forms. Of this we have an interesting instance in the simultaneous rise of Mohammedanism, and of the style of architecture commonly called Arabian or Moorish, but to which the name of Mohammedan might far more appropriately be given, seeing that it has everywhere followed the religion of the Crescent, and that the Arabians previously had no architecture peculiar to themselves. It is further remarkable that the style of which we speak seems to have arisen, as it were, undesignedly, or, at all events, without any conscious effort on the part of the people amongst whom it first appeared. The follow-

ers of the Prophet contemplated nothing peculiar in their ecclesiastical structures; and at first their mosques were built by Christian architects from Constantinople. As a natural consequence, they resembled Byzantine churches, modified in the countries of which the Moors successively possessed themselves by the features of the existing churches. Gradually the new and fanciful ornamentation known as Arabesque (q. v.) was added to the recognized features of Greek and Roman edifices. The exclusion of animal figures, which their abhorrence of the very appearance of idolatry necessitated, confined the Mohammedan artists to the imitation of vegetable productions, varied by geometrical patterns and inscriptions, of which the letters were woven into forms which suited them for architectural uses. But the most original feature in their edifices, and that by which they have continued to be marked from all others, is the horse-shoe arch. The example in the illustration presents a form which, notwithstanding its extreme beauty, has strangely enough scarcely ever been imitated in the Christian church. The pointed arch, on the other hand, and the various forms of the trefoil and quatrefoil arches, though there can be little doubt that we are indebted for them to the rich invention of the Moorish architects, have become so entirely Christian as to be no longer associated in our minds with the religion of the prophet. It is said that the pointed arch is to be found in Mohammedan buildings so early as 780 A.D. (Parker's *Glossary of Architecture*), whereas the earliest examples of its use in Christian architecture belong to the 12th c. Moorish architecture probably reached the highest point of development in the Alhambra, with the characteristics of which the English public have been made familiar by means of the court which bears its name in the palace at Sydenham.

ARABIAN LANGUAGE AND LITERATURE. Regarding the oldest literary culture of the Arabians, we possess but slight information. That their poetry at least must have had a very early development, may be inferred from the natural disposition of the inhabitants, who were characterized for their high spirit, courage, love of adventure, and delight in the glory of war. As far back as Solomon's time, the queen of Sheba (probably *Arabia Felix*) was noted for her sententious sayings. The nomadic tribes, living under the patriarchal rule of their sheiks, possessed everything that was favorable to the growth of a simple and natural poetry. They had quick and vivid feelings, and a rich, glowing fancy, which, operating upon the perils, the hardships and strange confederate life they led in those barren sand-deserts, and amongst naked rocks, could hardly fail to call forth a wild or vigorous minstrelsy. Before the time of Mohammed, the Arabians had celebrated poets who sang the feuds of tribes, and the praises of heroes and fair women. During the great fairs at Mecca and Okadh, poetic contests were held before the people as at the Grecian games; and the poems to which the prize was awarded, were re-written in golden characters, and suspended in the Kaaba at Mecca, the venerable national temple which the Mohammedans affirm to have been built by Abraham, or Ishmael. They are termed the *Moallakât*—i. e., 'the Suspended'—from the honor conferred on them, and are remarkable for their pathos, soaring conceptions, richness of imagery and phraseology, free and unconstrained spirit, and the glow of their love and hate. Among the famous poets of this early period are Nabegha, Asha, Shanfara—whose works were translated and published by De Sacy in his *Chrestomathie Arabe*—and, lastly, Kaab-ben-Zohair, who lived to celebrate the praises of the prophet Mohammed.

But the most brilliant of Arabic culture is that which Mohammed himself inaugurated in the Koran. His new doctrines of faith and life, collected under this title by the first calif, Abubekr, were revised and published by Othman, the third calif. The naturally adventurous spirit of the Arabs found a suitable excitement in the half-religious, half-military system of Mohammed, and, after his death, their fanaticisms prepared them for their subsequent career. Like an overwhelming torrent, they passed over the neighboring states, and in the short space of eighty years from the death of their prophet, had extended their dominion from Egypt to India, and from Lisbon to Samarcand.

During this time nothing can be said of their culture and refinement. A fanatical desire of conquest prevailed. Gradually, however, by their intercourse with civilized nations, the Arabian conquerors were themselves subjected to the humanizing influence of letters, and, after 749 A.D., or during the reign of the Abassides, literature, arts, and sciences appeared, and were generously fostered under the splendid sway, first of Almansor (754—775), and afterwards of the celebrated Harun-al-Raschid (786—808). Learned men were now invited from many countries, and remunerated for their labors with princely munificence; the works of the best Greek, Syriac, and old Persian writers were translated into Arabic, and spread abroad in numerous copies. The Calif Al-Mamun, who reigned from 813 to 833, offered to the Greek emperor five tons of gold and a perpetual treaty of peace, on condition that the philosopher Leo should be allowed for a time to give instruction to the former. There are few instances of such a price offered for lessons in philosophy. Under the sway of the same Al-Mamun, excellent schools were founded in Bagdad, Basra, Bokhara, and Kufa; while large libraries were collected at Alexandria, Bagdad, and Cairo. In Spain, the high school of Cordova rivaled the literary fame of Bagdad, and, generally, in the 10th c., the Arabs appeared everywhere as the preservers and distributers of knowledge. Pupils from France, and other European countries, then began to repair to Spain in great numbers, to study mathematics and medicine under the Arabs. There were fourteen academies, with many preparatory and upper-schools in Spain, and five very considerable public libraries; that of the Calif Hakem containing, as is said, more than 600,000 volumes. This state of culture, when compared with that prevalent before Mohammed, shows a rapidity of progress in knowledge almost as remarkable as the career of Arabian conquest.

In geography, history, philosophy, medicine, physics and mathematics, the Arabians rendered important services to science; and the Arabic words still employed in science—such as algebra, alcohol, azimuth, zenith, nadir, with many names of stars, &c.—remain as indications of their influence on the early intellectual culture of Europe. But geography owes most to them during the middle ages. In Africa and Asia, the boundaries of geographical science were extended, and the old Arab treatises on geography and works of travels in several countries by Abulfeda, Edrisi, Leo Africanus, Ibn Batuta, Ibn Foslan, Ibn Jobair, Albiruni the astronomer, and others, are still interesting and valuable.

History was also studiously cultivated. The oldest Arabic historian of whom we know is Mohammed-al-Kelbi (died in 819). About the same period, however, flourished several other historians. After the dawn of the 10th c., history became a favorite study of the Arabs. The first who attempted a universal survey of the subject were Masudi, Tabari, Hamza of Ispahan, and Eutychius, the Christian patriarch of Alexandria. Masudi's work is entitled *Meadows of Gold and Mines of Gems*. These were followed by Abulfaraj and George Elmakin (both Christians), Abulfeda, and others. Nuvairi wrote a *History of Sicily under the Government of the Arabs*. Various sections of Arabic histories relating to the Crusades have been translated into French. On the dominion of the Arabs in Spain, several works were written by Abul-Kasem of Cordova (died in 1139), Temini, and others. For extended notices we may refer the student of Arabic literature to the translations by Quatremère and others. Von Hammer began a history, which comes down only to the 13th c. (7 vols., 1850–56). See Zenker's *Bibliotheca Orientalis*.

Arabian theology and jurisprudence are intimately connected, and both founded on the Koran, but are by no means so simple and uniform as is generally supposed. Speculation first began to prevail during the Ommaiade dynasty, and the Aristotelian philosophy to be studied by the Arabs. As a consequence the vague statements of the Koran were soon variously interpreted, and a host of sects gradually arose. Of these, four only are regarded as orthodox, leaving not less than seventy-two heretical, whose discordant tenets are stated in the work of Sharistani (edited by Cureton, London, 1842). The four orthodox sects are: the Hanefites, who do not reject tradition, but subordinate it to rationalism; the Shafites, who entirely refuse the aids of reason and philosophy in their treatment of theology; the Kambalites and the Malechites, who allow speculation on points where there is no tradition. The collection of traditions known as the *Sunna* gives an account of the sayings and doings of Mohammed, and, though pedantic in its details, is in substance more valuable than the Koran. The interpretation of the Koran constitutes the principal part of education in theological jurisprudence. The most celebrated of the commentators are Samakhshari and Baidhawi. The conquest of Algiers has rendered the study of Arabic or Mohammedan law indispensable to the French. The result is, that several most important works on that subject have appeared of late from the Paris press, such as *Précis de Jurisprudence Musulmane, selon le Rite Maléchite par Khalil-Ibn-Ishak* (translated by Perron, Paris, 1848), and *Législation Musulmane Sunnite, Rite Hanéfi* (Paris, 1848).

Arabian philosophy, which was of Grecian origin, held the same relation to the Koran as the Scholasticism of the middle ages did to the Christian Scriptures—that is, it was regarded as the servant of faith. The chief study of the Arabs was the writings of Aristotle, who became known in Spain, and subsequently in all western Europe, through translations from Arabic into Latin; though the Arabs themselves only knew the Greek philosopher in translations made during the time of the Abassides. Especial attention was paid to logic and metaphysics. The most distinguished of their philosophical writers are: Alkendi of Basra, who flourished about the beginning of the 9th c.; Alfarabi, who wrote a work on First Principles in 954; Avicenna (died 1036), who combined the study of logic and metaphysics with that of medicine, and made considerable progress in chemistry, nosology, and medical botany;

Ibn-Yahya, who acquired a high reputation as an original thinker; Alghazali (died 1111), who wrote a book entitled *The Destruction of all Idolatrous Philosophical Systems*; Abubekr-ibn-Tofail (died 1190), who taught in his philosophical novel *Hai-ebn-Yokdan* (edited by Pococke, Oxford, 1671) the development of men from animals; and his pupil, Averrhoes, greatly esteemed as an expositor of Aristotle. For an account of these men and their systems, see *Sur les Ecoles Philosophiques chez les Arabes*, &c., by Schmölders (Paris, 1842), and Ritter's *Ueber unsere Kenntniss der Arab. Philosophie* (Gött. 1844); also Renan's *Averrois et l'Averroisme* (1850).

Many of these illustrious Arabian philosophers were also physicians. The great skill which the Arabs acquired in their knowledge of the uses and properties of medicinal herbs, is traced by Humboldt to their geographical position. The southern part of Arabia 'is characterized by the highly developed vital force pervading vegetation, by which an abundance of aromatic and balsamic juices is yielded to man from various beneficial and deleterious substances. The attention of the people must early have been directed to the natural products of their native soil, and those brought as articles of commerce from the accessible coasts of Malabar, Ceylon, and Eastern Africa. Hence arose the wish to distinguish carefully from one another these precious articles of commerce, which were so important to medicine, manufacture, &c. . . . The science of medicine, when considered with reference to its scientific development, is essentially a creation of the Arabs, to whom the oldest, and, at the same time, one of the richest sources of knowledge—that of the Indian physicians—had been early opened. Chemical pharmacy (see ALCHEMY) was created by the Arabs, whilst to them are also due the first official prescriptions regarding the preparation and admixture of different remedial agents—the dispensing recipes of the present day. These were subsequently diffused over the south of Europe by the School of Salerno' (Humbolt's *Cosmos*, vol. ii. p. 581, Bohn's translation.) Pharmacy and *materia medica* naturally led to botany and chemistry. For three centuries—from the 8th to the 11th—a rich scientific culture prevailed. Schools of philosophy and medicine sprung up at Jondisahur, Bagdad, Ispahan, Firuzabad, Bokhara, Kufa, Basra, Alexandria, Cordova, &c.

In all departments of medical science a great advance was made, except in anatomy. The reason of this exception lies in the fact, that the Koran forbids the dissection of bodies. The most famous writers on medicine are Aharun, Alkendi, Avicenna (q. v.), who wrote the *Canon of Medicine*, for a long time the only hand-book on the subject; Ali-ben-Abbas, Ishak-ben-Soleiman, Abulkasem, Averrhoes (q. v.), who wrote a complete system of medicine; Ali-ben-Isa, &c.

In mathematics, the Arabs made great advances by the introduction of the numerals and mode of notation now in use, of the sine instead of the chord (in trigonometry), and of a more extended application of algebra. Astronomy was zealously studied in the famous schools and observatories of Bagdad and Cordova. Alzahan wrote upon optics; Nassireddin translated the Elements of Euclid; Jeber-ben-Afla furnished a commentary on the trigonometry of Ptolemy, &c. The *Almagest* or System of Astronomy by Ptolemy, was translated into Arabic by Alhazi and Sergius as early as 812. In the 10th c., Albaten observed the advance of the line of the apsides in the earth's orbit; Mohammed-ben-Jeber-al-Batani, the obliquity of the ecliptic; Alpetragius wrote a theory of the planets; and Abul-Hassan-Ali, on astronomical instruments.

Besides these advances in the solid branches of knowledge, the genius of the Arabs continually flowered into poetry. Numerous poets sprung up in all lands where the children of the desert had carried their irresistible faith. Their verse, however, was not like the rude, simple minstrelsy of a purely patriarchal people; it gradually allied itself to the prevailing culture, and took, especially in the golden epoch of Arabian civilization, a highly artistic form. Motenebbi, Abul-Ala, and others acquired a great reputation for their delicate Idylls; Busiri, for his eulogy of Mohammed; Hamadâni, as the first to introduce novels in verse (of which he wrote 400 under the title of *Makâmât*), a style of literature which was brought to perfection by Hariri; Azzeddin, for his ingenious allegorical poem, 'The Birds and the Flowers.' Besides these, a singularly wild and fantastic prose literature made its appearance, in which the craving for the wonderful and gorgeous, so characteristic of the restless, adventure-loving Arabs, was richly gratified. Romances and ledgendary tales abounded. The most famous of these are: *The Arabian Nights' Entertainments* (q. v.), *The Exploits of Antar*, *The Exploits of the Champions*, and *The Exploits of the Hero*. In fact, with the exception of the drama, there was no sort of poetry which the Arabs did not attempt. The effect of this universality and richness in Arabic literature was, that it exercised a powerful influence on modern European poetry. The tales of fays, charms, sorceries, and the whole gorgeous machinery of enchantment passed into the poetry of the West. During the middle ages of European history, several of the most popular and widely-spread books were of Arabic origin; such as, *The Seven Wise Masters*, and *The Fables of Bidpai*, though the Arabians themselves borrowed largely from the Persian stories and the Greek fables.

All this culture of the early ages of Mohammedanism presents a strong contrast to the ignorance which now prevails among the Arabs. The brutal fanaticism of the Turks nipped the blooming promise of the East; sunk in stupid indolence, the peoples await in apathetic resignation their deliverance and return to higher modes of life. Literature now furnishes nothing worthy of notice. Learning spends itself principally in commentaries and scholia, in scholastic discussions on the subject-matter of dogmatics and jurisprudence, and in tedious grammatical disquisitions concerning the old Arabic speech, generally acute and subtle, but always unprofitable and unenlivening. The swift and mobile genius of the East has departed, and pedantic dulness has usurped its place. There are 'Dryasdusts' even in the desert. A few modern writers have attempted, with more or less success, to imitate European forms of thought and sentiment. Of these may be mentioned, Michael Sabbagh of Syria (*La Colombe Messagère*, Arabic and French, Paris, 1805); the Sheik, Refaa of Cairo (*The Broken Lyre*, Paris, 1827; *Manners and Customs of the Europeans*, Cairo, 1834; *Travels in France*, Cairo, 1825); and Nasif-Effendi, of Beirut, who wrote the critical observations in De Sacy's edition of Hariri (*Epistola Critica*, Leipsic, 1848).

The Arabic also possesses a Christian and Jewish literature, which, however, is chiefly ecclesiastical. Its principal ornaments are Eutychius, Elmakin, and Abulfaraj. Translations of the Old Testament were made not from the Hebrew, but from the Septuagint, or from Latin versions. In the middle ages, the Spanish Jews employed Arabic for their learned compositions; and several of the most important works of Moses Maimonides, &c., were originally written in that tongue.

The Arabic *language*, it has been remarked, is at once both *rich* and *poor*. It is necessarily destitute of innumerable words describing those ideas and objects which only civilization can develop or produce; but, on the other hand, the rich and nimble fancy of the Arabians has multiplied, to an almost incredible extent, the synonyms of their desert-tongue, so that in some cases several hundreds of expressions are found for the same thing. The Arabic belongs to the so-called Semitic family of languages, among which it is distinguished for its antiquity and soft flexible grace. It is divided into two dialects—a northern and southern. The former, through the instrumentality of the Koran, became the predominant language of literature and commerce throughout the whole extent of the Arabian dominions; the latter, called the Himyarite, although in all probability the source of the Ethiopic language and writing, is known as yet only by a few inscriptions, &c. The earliest Arabic grammarian is Abul-Aswad-al-Duli, who flourished under the fourth calif, Ali. The first who reduced the prosody and the metre of the Arabian poets to a system, was Khalil-ben-Ahmed-al-Ferahidi of Basra.

Al-Jauhari, who died in 1009 A.D., drew up a dictionary of the pure Arabic speech, which he entitled *Al-Sihah* ('Purity'), and which is held in high estimation to this day. Mohammed-ben-Yakub-al-Firuzabadi, who died in 1414, was the author of an Arabic Thesaurus, entitled *Al-Kamus* ('The Ocean'), which is the best lexicon in the language, and has consequently been translated into Persian and Turkish. Jordshani has explained, in alphabetical order, the meaning of the technical terms used in Arabic art and science. His work was published by Flügel (Leip. 1845), under the title of *Definitiones*. Meidani made a large collection of Arabic 'saws,' apophthegms, &c., which was published by Freytag, Bonn, 1838. Through the conquests of the Arabs in Sicily and Spain, their language became known in Europe; but notwithstanding the numerous traces of its influence in various European tongues, it became forgotten after the expulsion of the Moors from Spain. The first European scholars who earnestly took up the subject were the Dutch, in the 17th c.; after them, the Germans, French, and English. It is now, however, beginning to be considered a necessary part of a learned theological education. The modern Arabic of the inhabitants is substantially the same as that of the Koran, but the lapse of time has gradually introduced changes in the grammatical forms of the language, as in other languages. Wright's *Arabic Grammar* (new edition) is one of the best extant; Lane's *Arabic-English Lexicon* is a standard work; and Badger's *English-Arabic Lexicon* (1881) is also excellent. The grammatical and lexicographical works of Caspari, Freytag, Fleischer, De Sacy, and Boethor, are most important.

Arabic Writing.—Like all Semitic writing, this proceeds from right to left. It is borrowed from the old Syriac, and was probably introduced into Arabia by Christian missionaries about the time of Mohammed. In its oldest form it is called Kufic, from the town of Kufa, on the Euphrates, where the transcription of the Koran was busily carried on. Its characters are rude and coarse, and it has particular symbols for only sixteen of the twenty-eight Arabic consonants. This writing, nevertheless, continued to be employed for 300 years, and for coins and inscriptions even later; but in the 10th c. it was displaced for common purposes by a current hand

writing, the *Neskhi*, introduced by Ebn Mokla. This is the character still in use. In it, the consonants which resemble each other are distinguished by points, and the vowels by strokes over and under the line

ARABIAN NIGHTS' ENTERTAINMENTS, a collection of Oriental tales, first made known to Europe by Antony Galland, a French orientalist, under the title of *The Thousand and One Nights, Arabian Stories, Translated into French*. They were published at Paris, in 12 volumes 12mo, from 1704 till 1717, and were received by many as the production of the genius of the translator himself, rather than the collection of *an unknown Arabian author*, as Galland had stated in his dedication. Oriental scholars did not hesitate at first to declare against their authenticity, and denounce them as forgeries. Having taken only an obscure place in the literature of the East, and their style unfitting them from being classed among models of eloquence or taste—having no object of a religious, moral, or philosophical kind in view, while the manners and customs delineated in them were different from all received ideas of those of the Moslem nations—their success took the critics by surprise. The work became highly esteemed by the public; it filled Europe with its fame; it had abundance of readers, and no lack of editors. Few books have been translated into so many different languages, and given delight to so large a number of readers. It may be said that, in these Oriental tales, there has sprung up a new branch of literature, for their influence on the literature of the present day is easily discernible. Here are found, depicted with much simplicity and great effect, the scenes of the town-life of the Moslem. The prowess of the Arab knight, his passion for adventure, his dexterity, his love and his revenge, the craft of his wives, the hypocrisy of his priests, and the corruptibility of his judges, are all dramatically delineated—far more vividly represented, in fact, than is possible in a book of travels; while gilded palaces, charming women, lovely gardens, and exquisite repasts captivate the senses of the reader, and transport him to the land of wonder and enjoyment. Besides entertaining the mind with the kaleidoscopic wonders of a teeming and luxurious fancy, which is their most obvious merit, they present a treasure of instruction upon life in general, and Oriental life in particular. And this is undeniable, notwithstanding the fact, that the aspects of society they depict are far from standing high in the social scale, either as to civilization or morality. In them no story is to be found that will rank in morality with the story of Joseph and his brethren, simply because the Moslem faith will not admit of that, any more than the decline of Arab civilization at the time the tales must have been originally promulgated. Indeed, the first translator, having a conviction of a demoralizing tendency of this kind, avoided giving several objectionable parts of some of the stories. The thread of the narrative in these entertainments is generally simple and clear, often leading into the departments of fable, and occasionally into the regions of the supernatural and the domains of popular superstition. The tales, even when long, are not tiresome; for they consist of shorter stories branching off the main one, or rather encased within it, the smaller within the larger, and perhaps a smaller within that, like the little boxes used by conjurors.

For many years all doubt as to the authenticity of the *Thousand and One Nights* has been dispelled. Several MS. copies have been found and no less than four editions of the Arabic text have been published. A more thorough acquaintance with medieval and modern Arab life has proven the genuineness of the stories, and the truthfulness of their general representation of the mind of the Moslem. In them there are evident signs of a declension from a refined and superior civilization; the marvelous and supernatural is predominant; despotism in all its forms is manifest; and a prevalent falsity and insincerity of character visible, not only in the narrative, but in the tone of common conversation, replete as it is with oaths and asseverations.

The origin of the work—where and by whom written—is still involved in mystery. According to some, the tales are susceptible of a threefold division. The most beautiful, and in fancy the richest, appear to have come from India, the cradle of story and fable; the tender and often sentimental love tales seem of Persian origin; while the masterly pictures of life, and the witty anecdotes, claim to be the product of Arabia. Throughout, however, everything is comformable to the character and customs of the town population of Arabia, and to the Mohammedan faith. The Baron De Sacy, in 1829, thus stated his opinion on these points. Speaking of the work he says: 'It appears to me that it was originally written in Syria, and in the vulgar dialect; that it was never completed by its author; that, subsequently, imitators endeavored to perfect the work, either by the insertion of novels already known, but which formed no part of the original collection, or by composing some themselves, with more or less talent, whence arise the great variations observable among the different MSS. of the collection; that the inserted tales were added at different periods, and perhaps in different countries, but chiefly in Egypt; and, lastly, that the only thing which can be affirmed, with much appearance of probability, in regard to the time when the work was composed, is—that it is not very old, as its language proves, but still that, when it was brought out, the use of tobacco and coffee was unknown, since no mention of either is made in the work.'

Galland's French edition was speedily translated into all the languages of Europe; edition following edition with great rapidity, some of them with enlargements, and others with modifications. A new English translation from the Arabic appeared in 1839 (new issue, edited by S. Lane Poole, in 1882). It was the work of E. W. Lane, a gentleman whose long residence in Egypt enabled him to acquire so thorough a knowledge of the language, manners and customs of the Egyptian Arabs, as furnished not only a superior version, but a series of notes embodying a portraiture of Egypto-Arabian life at once faithful and vivid. A complete translation by Payne, assisted by Captain Burton, was announced in 1882; and a translation of the tales not in Galland or Lane, by Kirby in the same year.

The popularity of this wonderful book has given rise to hundreds of imitations. Among the best of the French are—*Les Mille et Un Jours, Mille et Une Quart d'Heures*, and the *Contes d'un Endormeur;* perhaps the best of the English imitations is the *Tales of the Genii*, by Sir Charles Morell; while the best of the German appears to be one got up from the Perso-Arabic, the *Faraj bâd el Shidda* (Joy after Sorrow), a popular work, and repeatedly published.

ARABIAN NUMERALS or CIPHERS—the characters 0, 1, 2, 3, 4, 5, 6, 7, 8, 9. Properly, they should be styled Hindu or India' Numerals, for the Arabs borrowed them, along with the decimal system of notation, from the Hindus. According to one account, Gerbert (afterwards Sylvester II.) learned the use of them from the Moors in Spain in the 10th c.; others think it more probable that Leonardo of Pisa (see ALGEBRA) first introduced them from the East into Italy about 1202. Yet the use of them was long in making its way, and was not general before the invention of printing. Accounts continued to be kept in Roman numerals up to the 16th c. See NUMERALS and NUMERATION.

ARABIAN SEA, anciently *Mare Erythræum*, or the *Red Sea*, that bay of the Indian Ocean which lies between India on the east and Arabia on the west. Its northern boundary is Beloochistan; while its natural and convenient limit on the south is a line drawn from Cape Comorin in Hindustan to Cape Guardafui in Africa, and thence continued along the coast to the Strait of Bab-el-Mandeb. In E. long. it extends from 43° 32′ at Cape Bab-el-Mandeb, to 77° 30′ at Cape Comorin; and in N. lat. from 8° 5′ at Cape Comorin, to about 26° at the south-west point of Beloochistan. Including its two great arms, the Red Sea proper and the Persian Gulf, it stretches far both north and west. By the former it is, since the opening of the Suez Canal in 1869, connected with the Mediterranean Sea. In this last aspect the A. S. long occupied a most prominent place in the commerce of the world—a place which, after having lost it for more than 300 years through the doubling of the Cape of Good Hope in 1497, it has lately in a great measure regained, through the enterprise of English capitalists, the Egyptian government, and the perseverance of M. Lesseps.

In the history of navigation, also, the A. S. proper is specially entitled to notice. It was along its northern shores that Nearchus, the admiral of Alexander of Macedon, conducted the first well authenticated voyage, on a large scale, of exploration and discovery; and across it the trade-winds, blowing alternately from north-east and south-west, were wont to waft the Greeks of Egypt, without either chart or compass, about the commencement of the Christian era. See SUEZ CANAL.

A'RABINE is the essential principle of gum-arabic (q. v.), and is obtained pure by adding alcohol to a solution of gum-arabic in water, when the A. is precipitated in white flocculi.

A'RACAN, or ARRACAN, a city of British Burmah, and, till lately, the capital of the province of the same name. It is situated about 50 miles from the sea, in lat. 20° 42′ N., and long. 93° 24′ E. Lying in a swampy valley which, on almost every side, is confined by hills, A. is subject to febrile disease in all its forms. Previous to the first Burmese war—the occasion which brought it under British dominion—it is said to have contained 18,000 houses; while in 1835, after it had ceased to be the seat of government, the population had sunk to 8000. In 1877 the inhabitants of the town hardly exceeded 2000. A., now known as MRO-HOUNG ('old town'), is, in fact, interesting only from its old associations. The most striking memorial of antiquity is its dilapidated fort, consisting of three concentric walls such as only a powerful state could have constructed. Beyond the limits, too, of this citadel, the town, as a whole, appears to have been surrounded by a circumvallation of 9 miles in length, composed partly of steep and rugged eminences and partly of artifical works. These defences, which are believed to be several centuries old, the British carried by assault on 1st April 1825.

A'RACAN, or ARRACAN, the most northern division of British Burmah, is bounded on the N. by Chittagong, on the E. by Ava, on the S. by Pegu, and on the W. by the Bay of Bengal. It extends in N. lat. from 18° to 21° 33′, and in E. long. from 92° 10′ to 94° 50′. Its extreme length is 290 miles; and its breadth, from 90 miles at the N., gradually diminishes towards the S., so as to yield an average of little more than 45. The area is 14,526 sq. miles. A range of mountains, nearly parallel with the line of coast, the highest point 7000 feet above the sea-level, separates A. from Pegu and Upper Burmah. The soil of the northern portion of A. is alluvial; but the country is hilly, difficult of access, and covered with forest. The province is divided into four districts—Akyab, Sandoway, Ramree, and North Aracan. The British conquest of the province has been highly beneficial in every way. In 1825—1826, the population was only about 100,000; in 1831, it was 173,000, showing an increase of 73 per cent. in 5 or 6 years; in 1839, it had increased to 248,000; before 1854, it was upwards of 321,000; and in the returns for 1872, it is stated to be 483,363, or 33 mouths to the square mile. With these results the face of the country and the state of trade fully correspond. Rice and salt constitute the chief articles of exportation; the others are tobacco, sugar, wood, oil, betelnuts, buffalo hides and horns, elephants' teeth, dried fish, and edible birds'-nests. The imports consist of British woollens, muslin , cutlery and glass.

There have been various indications of a volcanic nature in A. In the islands of Ramree and Cheduba there exist springs of muddy water which emit bubbles of gas. Two severe earthquakes have taken place respectively in 1763 and 1833—the latter having thrown up in several places, muddy water of a sulphurous smell, and also, on one particular spot, vapor and flame to the height of several hundred feet. Of the mineral resources very little is known. Iron ore has been found, but not in such quantity and quality as to come into profitable competition with British iron. Coal also exists, which is understood to be good, but, from whatever cause, it has not been extensively worked. There are no lakes in the province, nor are there any rivers of much importance, though the Aeng, which appears to be the most available among them, is said to be navigable during spring-tides to 45 miles from its mouth.

ARACA'RI, or ARICARI (*Pteroglossus*), a genus of birds closely allied to the Toucans (see TOUCAN), and differing from them chiefly in the somewhat smaller bill, which is not so thick as the head. They are generally also of smaller size, and the prevailing color of their plumage is green, often varied with brilliant red and yellow. Like the toucans, they are natives of the warm parts of South America.

ARA'CEÆ. See ARUM.

ARACHIS, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, natives of the warm parts of America, of which, until recently, the only known species was the A. *hypogæa*, sometimes called the underground kidney-bean, and more frequently the ground-nut. It also receives the names of earth-nut, American earth-nut, and mandubi. It is an annual plant, with hairy pinnate leaves, which have four leaflets. The flowers are yellow, the standard veined with red. After flowering, the flower-stalks elongate and bend towards the earth, into which the pods penetrate, ripening underground. The pods have a lining of a sort of net-work, and generally contain two, three, or four seeds, which are about the size of a hazelnut, of a sweet taste, with a little of the flavor which belongs to most kinds of pulse.

Arachis hypogæa.

This plant is now cultivated in all the warm regions of the globe, and its usefulness is such that its cultivation is likely to extend. It was introduced from Peru into Spain, and thence into France. It succeeds in favorable situations even in the middle of France, where it is sown after all danger of frost is thought to be over, and yields from eighty to one hundred fold. Its cultivation is so general in the western parts of Africa, and even in the interior, that doubts have been therefore entertained of its American origin, of which, however, the eminent botanists seem to be quite satisfied. The seeds are sometimes eaten raw, but more generally boiled or roasted. In New Spain, and in some parts of Africa, they form one of the principal articles of food; but the importance of the plant is chiefly owing to the fixed oil contained in them, which is used for the same purposes as olive or almond oil, and is quite equal to olive oil either for lamps or for the table. This oil is also much used in Spain in the manufacture of soap and of chocolate. A bushel of the seeds yields one gallon of oil, when expressed cold; if heat is applied, the quantity is greater, but the quality inferior. It has become a considerable article of commerce. The *A. hypogæa* delights in a light and sandy, but at the same time fertile, soil. The seeds are dug up as roots or tubers usually are. The root has qualities resembling those of liquorice, for which it is sometimes used. The herbage is good for cattle. Several new species of this genus have been discovered in Brazil.

ARA'CHNIDA, or ARACHNIDES (Gr. *arachne*, a spider), a sub-class of Tracheate Arthropoda (q. v. under ARTICULATA), including scorpions, spiders, mites, &c., and first separated by Lamarck from the *Insecta* of Linnæus. The body is usually divided into cephalo-thorax and abdomen, the latter destitute of appendages, the former possessing six pairs, of which the posterior four pairs are walking limbs, thus furnishing a ready means of distinction from insects, which have three pairs only. The two anterior pairs known as cheliceræ and pedipalpi are of various forms, the former usually chelate or sub-chelate; the latter chelate, ambulatory, or antenniform. Respiration is effected by means of tracheal tubes, or by pouches—the so-called respiratory sacs.

Those A. with segmented abdomen are termed *Arthrogastra*, and include five families, of which *Scorpio*, *Thelyphonus*, *Chelifer*, *Galeodes*, and *Phalangium* are types. These show a distinct gradation to true spiders or *Araneina*, which are easily recognized by their unsegmented abdomen usually furnished with spinning glands, opening by four to six posterior papillæ, and by their sub-chelate cheliceræ and ambulatory pedipalpi. The mites and ticks (*Acarina*) have the unsegmented abdomen continuous with the thorax, and the cheliceræ and pedipalpi are modified into a sucking or piercing apparatus. The *Linguatulida* (*Pentastomum*), the *Tardigrada*, and the *Pycnogonida*, have usually been reckoned as highly modified Arachnides, somewhat akin to the *Acarina;* the most recent anatomists, however, tend to remove them from the A. altogether. On the other hand, it has lately been clearly shown that the Silurian *Eurypterida*, and the ancient, but still persistent *Limulus* (see KING-CRAB), must be reckoned rather as Arachnides than as Crustaceans, and thus the two great divisions of the Arthropoda, the Tracheata and the Branchiata, are shown to have diverged in palæozoic times. See ACARUS, MITE, SCORPION, SPIDER and TICK; also Huxley's *Anat. of Invertebrated Animals*, Balfour's *Comparative Embryology*, and Cambridge's memoir in *Encyc. Britannica*, ninth edition.

ARA'CHNOID MEMBRANE, one of three coverings of the brain and spinal cord, is a thin glistening, serous membrane, which, by its parietal layer, adheres inseparably to the dura-mater on its outer side, and more loosely to the pia-mater which is between it and the brain substance. Between the pia-mater and the A. M. in some situations there are considerable intervals (sub-arachnoid spaces); they are filled with a fluid named cerebro-spinal, the presence of which is necessary to the proper action of the nervous centers. See CEREBRO-SPINAL FLUID—PIA-MATER.

ARAD, a town in the district of A. in Upper Hungary. It is situated on the right bank of the Marosh, an affluent of the Theiss, and is also styled Old A., to distinguish it from New A., which is built on the opposite side of the river. A. has a population (1880) of 35,718, including many Jews, who are very wealthy. It carries on a large trade in corn, tobacco, &c., and was at one time the greatest cattle-market in Hungary, and is even yet only inferior to Pesth and Debreczin. During the 17th c., it was often captured, and at last destroyed by the Turks. Its new fortifications, erected in 1763, made A. an important position in the revolutionary war of 1849, when it was occupied for a considerable time by the Austrian general Berger, who capitulated here in July 1849. From this place Kossuth issued his proclamation of August 11, 1849, in which he expressed in impassioned terms his despair of the Hungarian cause for the present. After the catastrophe of Világos, on the 17th August, A. was surrendered to the Russians through the treachery of Görgey.

NEW A., a town in the Banat of Temesvar, contains (1880) 5141 inhabitants, including many Germans, who are the principal persons in the place. The district or province of A. has an area of 1700 sq. m., and contains (1886) 303,964 inhabitants. The eastern district is occupied by a branch-chain of the Carpathian mountains, which contain marble quarries, and mines of copper and iron; the west is level; and produces wheat, maize, and several varieties of wine, as well as abundance of fruits. The inhabitants are chiefly Wallachians.

ARÆO'METER. See AREOMETER.

A'RAFAT, MOUNT, or *Jebel-er-'rahme* ('Mountain of Mercy'), is a granite hill about 15 miles S.E. of Mecca, which is believed by

the Mohammedans to be the spot where Adam, conducted by the angel Gabriel, met again his wife Eve, after a punitive separation of 200 years, on account of their disobedience in Paradise. It is not above 200 feet high, but its circuit is a mile and a half. Its importance since the time of Mohammed arises from its being the scene of a yearly procession of the faithful who visit Mecca. Burckhardt, who witnessed the procession of 1814, states that not less than 70,000 people were present, and that at least forty different languages were spoken. The principal part of the religious ceremony of this pilgrimage is a sermon, the hearing of which entitles all to the name and privileges of a Hadji.

A'RAGO, Dominique, a celebrated French astronomer and natural philosopher, was born February 26, 1786, at Estagel near Perpignan, in the department of the Eastern Pyrenees. At the early age of seventeen, he entered the Polytechnic School at Paris, where the spirit, promptitude, and vivid intelligence he exhibited in his answers to the questions of Legendro, excited the admiration of every one. In 1804, he became secretary to the Observatory at Paris. Two years afterwards, he was engaged, with Biot and others, by the French government, to carry out the measurement of an arc of the meridian, which had been commenced by Delambre and Méchain. A. and Biot had to extend it from Barcelona to the Balearic Isles. The two *savans* established themselves on the summit of Mount Galatza, one of the highest of the Catalonian branch of the Eastern Pyrenees. Here they lived for many months, communicating by signals with their Spanish collaborateurs, across the Mediterranean in the little isle of Iviça, though many a night the furious tempests destroyed their hut along with the labor of weeks. Visitors they had none, except two Carthusian monks, who were wont to come up and spend a portion of the evening in converse with them. Before A. had completed his calculations, Biot had returned to France, and war had broken out betwixt the two nations. A. was now held to be a spy; his signals were interrupted; and with great difficulty he succeeded in making his escape to Majorca, where he voluntarily imprisoned himself in the citadel of Belver, near Palma. At last he obtained his liberty on condition of proceeding to Algiers, which he did; but was captured, on his return to France, by a Spanish cruiser, and sent to the hulks at Palamos.

He was, however, liberated after a time, and sailed once more for France; but almost as he was entering the port of Marseille, a tempest arose which drove the vessel across the Mediterranean all the way to Algiers. The former dey, to whose demands he had owed his liberation from the hulks, was dead; his successor, a ferocious tyrant, placed him on his list of slaves, and intended to employ him as interpreter. After some time, he was released at the request of the French consul, and, narrowly escaping another capture by an English frigate, finally found his way to Marseille in July 1809. As a reward for his suffering in the cause of science, the Academy of Sciences suspended its standing rules in his favor; and though only twenty-three years of age, he was elected member in the place of Lalande, who had just died, and was appointed Professor of Analytical Mathematics in the Polytechnic School. Afterwards his attention was devoted more to astronomy, magnetism, galvanism, and the polarization of light. In 1811, he read a paper to the Academy, which may be considered the foundation of 'chromatic polarization.' In 1812, he commenced his extraordinary course of lectures on astronomy, &c., which fascinated all Paris—the savans, by their scientific rigor and solidity; the many, by their brilliancy of style. In 1816, along with Gay Lussac, A. established the *Annales de Chimie et de Physique*, and confirmed the truth of the undulatory theory of light. In the same year he visited England for the first time, and made the acquaintance of various persons distinguished in science, especially Dr. Thomas Young. In 1818 appeared his *Recueil d'Observations géodésiques, astronomiques, et physiques*. In 1820, he turned his facile and inventive genius into a new channel, and made several important discoveries in electro-magnetism. Oersted had shown that a magnetic needle was deflected by a voltaic current passing along a wire. A. pursued the investigation, and found that not only a magnetic needle, but even non-magnetic substances, such as rods of iron or steel, became subject to deflection also, exhibiting, during the action of the voltaic current, a positive magnetic power, which, however, ceased with the cessation of the current. Some time after, he demonstrated that a bar of copper, and other non-magnetic metals, when moved circularly, exert a noticeable influence on the magnetic needle. For this discovery of the development of magnetism by rotation, he obtained, in 1825, the Copley Medal of the Royal Society of London; and in 1834, when he again visited Great Britain, especial honors were paid to him by the friends of science in Edinburgh and Glasgow. Four years previous to this second visit to Great Britain, he had received the honor he most coveted—that of being made Perpetual Secretary of the Academy. It was while holding this office that he wrote his famous *éloges* of deceased members, the beauty of which has given him so high a place among French prose-writers.

As a politician, also, his career was remarkable. He was a keen republican, and took a prominent part in the July revolution (1830). In the following year he was elected by Perpignan as member of the Chamber of Deputies, where he occupied a position on the extreme left. In the February revolution of 1848, he was chosen a member of the provisional government, and appointed minister of war and marine. In this position he resisted the proposed measures of the Socialist party, regarding the constitution of the United States as the beau-ideal of democracy. His popularity in his own province was the means of preventing the discontented population of the East Pyrenees from proceeding to lawless and violent measures. On the question of the presidency, A. opposed Louis Napoleon, declared himself against the policy of the new ministry, and refused to take the oath of allegiance after the *coup d'état* of 1852. The emperor, in a letter, paid a high eulogium on his talents and virtues, and made a special exception in his case. A. died October 3, 1853. In his general character A. was sociable, energetic, and fond of fame. He was the intimate friend of Alexander von Humboldt.

Arago, Jacques Étienne Victor, brother of the great savant, was born in 1790. In 1817 he accompanied the expedition, under Freycinet, in a voyage round the world. Afterwards, we find him engaged, first at Bordeaux, and then at Toulouse, in several branches of light literature, industriously writing, in company with other scribes, a multitude of vaudevilles, besides publishing several poems and romances. In the year 1835, he undertook the management of the theater at Rouen; but having become afflicted with blindness, he was compelled to resign this post in 1837. To his early voyage round the world, we owe two very pleasant books of travel: *Promenade autour du Monde* (Paris, 1838); *Souvenir d'un aveugle. Voyage autour du Monde* (Paris, 1838). In 1849, though deprived of sight, he formed a company of speculators; placed himself at the head of it, and departed for California, to search for gold on a large scale. His companions mutinied, and left him, deserted and disappointed, at Valparaiso. On his return he published his painful experiences, under the title, *Voyage d'un aveugle en Californie et dans les Regions aurifères* (Paris, 1851). He died, January 1, 1855.—A., Étienne, another brother of the astronomer, was born 1802, and is well known in France as a popular *feuilletonist* in the *Siècle*, and other journals. He held an appointment under the provisional government, as director-general of the post-office, in which he displayed great vigor, promptitude, and sense, and achieved several postal reforms; was elected member of the National Assembly; was compromised by the insurrection in June, and sentenced to exile for life. In 1859 he returned to France; and at the time of the Franco-Prussian war was mayor of Paris—an office which he resigned in November 1870—A. Jean, another of the brothers A., born 1789, died 1836, was general of the republican army in Mexico, and wrote, in Spanish, a history of Mexico.

A'RAGON, once a kingdom, then a province in the N.E. of Spain, lies between 40° 2′ and 42° 54′ N. lat., and long. 2° 10′ W. and 0° 45′ E. Greatest length from north to south, 190 m.; breadth, 130. Area, 17,900 sq. m. Pop. (1877) 894,727. It is bounded, N. by the Pyrenees, separating it from France; W., by Navarre, and Old and New Castile; S., by Valencia, and part of New Castile; and E., by Catalonia, and part of Valencia. The river Ebro, which descends from the northern heights of Old Castile, flows through the middle of A. in a south-easterly direction, receiving numerous tributaries both from the lofty regions of the Pyrenees, and from the Sierras in the south; of the former, the principal are—the Noguera, which forms the boundary-line between Aragon and Catalonia, the Essera, and the Gallega; of the latter, the principal are—the Guadalope, the San Martin, and the Salon. The province is naturally divided into the level country, along the Ebro, and the northern mountainous district of Upper Aragon. The central plain is sterile, poorly supplied with water, and intersected by deep ravines (*barancos*). Agriculture is here confined to the raising of maize vines, and olives; but on the sides of the Ebro, where water abounds, rice and other grains are abundantly produced; and in the valleys of Upper A., which are at once the most beautiful and fertile of all the Pyrenean valleys, we find a splendid vegetation, and a soil that enables the inhabitants, in spite of the wretchedness of their agriculture, to grow considerable quantities of wheat, rye, maize, barley, &c. The climate of the province is various; comparatively cool in the mountain-districts, but often very sultry on the plains. Spurs of the Pyrenees strike down into the province a long way. It is between these ridges that the rich valleys lie, some of them upwards of 20 miles long. The slopes of the hills are clothed with forests of oak, beech, and pine, and the felled timber is floated down the rivers into the Ebro, and thence down to Tortosa at its mouth. The minerals of the province are copper, lead, iron, salt, alum, saltpetre, coal, and amber. The manufactures are inconsiderable. A., peopled by a brave, active, enduring, but obstinate race, has frequently been the arena of sanguinary warfare. It early became a Roman province; and, on the

fall of the Empire, passed into the hands of the West-Goths, but was conquered by the Moors in the beginning of the 8th c. The rulers of A., after it had been recovered from the Moors, and united with Catalonia (1137), became powerful; obtained possession of the Balearic Isles in 1213, of Sicily in 1282, of Sardinia in 1326, and of Naples in 1440. By the marriage of Ferdinand with Isabella, heiress of Castile, in 1469, the two States of A. and Castile were united, and formed the foundation of the great Spanish monarchy. After Ferdinand's death in 1516, the union of the states was made permanent. In the war with the French, 1808—9, Saragossa, the capital of A., was remarkable for its heroic defence under Palafox; and in recent Spanish wars, the people of A. have displayed the same courage which marked their conduct on that memorable occasion. Upper A. was on the side of the queen; but lower A. generally adhered to the party of Don Carlos. The province is now divided into three departments—Saragossa, Teruel, and Huesca. The chief towns are Saragossa, Calatayud, Huesca, and Teruel. See SARAGOSSA, &c.

ARAGO'NA, a town of Sicily, 8 miles north-north-east from Girgenti. It is a poor town, and stands in the midst of bare green downs; but the hills above it are clothed with pines, cypresses, olives, almonds, and carobs. The only object of interest is the old castle of the princes of Aragona, a huge building, in the Renaissance style, which has fallen much into decay. Pop. 7947.

ARAGUAY', a large river of Brazil, rising in S. lat. 18° 10′ and W. long. 51° 30′. Like most of the considerable rivers of the country, it flows towards the N. After a course of about 1000 miles to San Joao, it there joins the Tocantins, which again, after a northerly course of 300 miles more, mingles its estuary with that of the Amazon round the Isle of Marajo. Like most of the rivers in this part of Brazil, the A. is of difficult navigation, being frequently interrupted by rapids.

A'RAL, LAKE, next to the Caspian Sea, from which it is separated by the plateau of Ust-Urt, is the largest lake in the steppes of Asia. It lies wholly within the limits of Russian Central Asia, between 43° 42′ and 46° 44′ N. lat., and 58° 18′ and 61° 46′ E. long. It is fed by the river Sir (the ancient Jaxartes) on the N.E. side, and the Amu (or ancient Oxus) on the S.E. It is shallow, and has no outlet. Its level is 117 feet above that of the Caspian, and 33 feet above that of the Black Sea. Like other lakes which are drained only by evaporation, it is brackish. Owing to the shallowness of its waters, navigation is difficult; but Russian steamers have been launched upon it, and took part in the operations against Khiva in June 1873. The history of the Sea of Aral is very remarkable. Sir Henry Rawlinson and Colonel Yule have recently collected references made to it in Greek, Latin, Arabic, and Persian writers, and have established the fact that the area it now occupies has been dry land twice within historical times—the Jaxartes and the Oxus then running south of the Sea of Aral to the Caspian. This was the case during the Greco-Roman period, and again during the 13th and 14th centuries after Christ. The Russian government has undertaken the restoration of the Oxus to its old bed.—See *Proceedings of Royal Geographical Society*, vol. xi., vol. xvi., and vol. i. (new series, 1879); also *The Shores of Lake Aral*, by Major Wood (Lond. 1876).

ARA'LIA, a genus of plants, the type of the natural order *Araliaceæ*. This order is dicotyledonous or exogenous, and consists of trees, shrubs, and herbaceous plants, resembling the *Umbelliferæ* (q. v.) both in their general habit and in their botanical characters, but differing essentially in the fruit, which is not *didymous* or formed of two separable carpels as in the *Umbelliferæ*. The fruit of the Araliaceæ consists of several one-seeded cells, and is often succulent. The order contains about 160 known species, natives of tropical, temperate and cold climates, generally possessing stimulant and aromatic properties. Poisonous qualities are not developed as in the *Umbelliferæ*. The herbage of many species affords good food for cattle, and some are used for human food. The genus ARALIA contains a considerable number of species—trees, shrubs, and herbaceous plants. It has a succulent fruit, with 5 or 10 cells, crowned with the styles. *A. nudicaulis* is a native of the United States of America, a species of humble growth, having a solitary radical leaf with a trifid stalk and ovate serrated segments, the scape is shorter than the leaf. The root is said to be equal in value to sarsaparilla as an alterative and tonic. *A. racemosa*, *A. spinosa*, and *A. hispida*, also natives of North America, produce an aromatic gum resin. *A. spinosa* is a stimulant diaphoretic. The berries, infused in wine or spirits, are employed in America as a cure for rheumatism. It is sometimes called Toothache-tree: it also bears the name of Angelica-tree. It is a native of moist woods in Virginia and Carolina, growing to a height of ten or twelve feet, with a single stem, spreading head, doubly and trebly pinnate leaves and ovate leaflets, and is very ornamental in a lawn. *A. polaris*, found in the southern island of New Zealand, and in the greatest abundance and luxuriance in Lord Auckland's Islands, is described by Dr. Hooker as a 'very magnificent plant,' a herbaceous perennial, 4—5 feet high, with large orbicular masses of green foliage and waxy flowers, presenting a very striking appearance. *A. edulis* now called *Dimorphanthus edulis*, is employed in China as a sudorific. Its shoots are very delicate and pleasant when boiled; and the roots, which have an agreeable aromatic flavor, are used by the Japanese as carrots or parsnips are in Europe. Aralias abound in the warm valleys of the Himalaya. The natives collect the leaves of many as fodder for cattle, for which purpose they are of great value in a country where grass for pasture is scarce; but the use of this food gives a peculiar taste to the butter. Chinese rice paper has been ascertained to be cut from cylinders of the pith of an A. Ginseng (q. v.), the root of a species of Panax, is one of the most important products of the order *Araliaceæ*. The astringent roots of *Gunnera scabra*, or Panke, are used in tanning, but its fleshy leaf-stalks are eaten like those of rhubarb. It has been seen on the sandstone cliffs of Chiloe with leaves nearly eight feet in diameter, each plant with four or five of these enormous leaves. It has been introduced into Britain, and is found to succeed well in the climate of Edinburgh. The only representatives of this order in the British flora are the Ivy (q. v.), and a small plant called the Tuberous Moschatel (*Adoxa moschatellina*).

A'RAM, EU'GENE, was born in 1704 at Ramsgill, in Yorkshire. His father was a gardener, and could afford to keep A. at school only for a short time; but even while assisting his father, he contrived to gratify his passion for learning. At an early period of his life he married, and became a schoolmaster, first in Netherdale, and afterwards at Knaresborough, where he continued to reside till 1745. In the town of Knaresborough lived one Daniel Clarke, a shoemaker, and an intimate acquaintance of A.'s. On one occasion Clarke happened to purchase a quantity of valuable goods, which he easily obtained on credit; but to the surprise of everybody, he soon after disappeared, and no trace of him could be discovered. Suspicion lighted upon A., not as Clarke's murderer, but as his confederate in swindling the public. His garden was searched, and in it was found a portion of the goods which Clarke had purchased. A. was arrested and tried, but acquitted for want of evidence. He now left his wife at Knaresborough, and went to London, and other parts of England, in his capacity of schoolmaster; and in spite of his nomadic mode of life, contrived to acquire a knowledge of botany, heraldry, Chaldee, Arabic, Welsh, and Irish, and was planning a great etymological work, to be entitled 'A Comparative Lexicon of the English, Latin, Greek, Hebrew, and Celtic languages,' when he was suddenly dragged away from his ushership of Lynn Academy, in Norfolk, and committed to prison on a charge of murder.

The circumstances of the remaining portion of the story are pretty well known. In 1759, a skeleton was dug up near Knaresborough, which the inhabitants suspected to be that of Clarke, for they had now come to the conclusion that the unfortunate man had met with foul-play, especially as A.'s wife had, on several occasions, made strange statements to the effect that her husband and a man named Houseman, knew more of Clarke's disappearance than they chose to admit. Houseman was now confronted with a bone of the skeleton which had been discovered. He very emphatically denied that it was Clarke's. People naturally wondered how he *could* be so positive, the bones of skeletons being, to the uneducated eye, so similar in appearance. They became convinced that if the skeleton was not Clarke's, Houseman must know where the latter was. At last he confessed that he had been a spectator of the murder of Clarke by A. and one Terry. He named the place where the body had been hidden. It was searched, the buried skeleton was dug up, and A. was tried at York, for the murder of Clarke, on the 3d August 1759. What has given so extraordinary an *éclat* to this trial, is the fact that A. conducted his own defence. He attacked, with great acumen, plausability, and curious erudition, the doctrine of circumstantial evidence; but to no effect, for a verdict of guilty was returned, and he was condemned to be executed three days afterwards. In the interval, he confessed his guilt to the clergyman who attended him. While in the condemned cell, he wrote a defence of suicide; but failed in a practical illustration of the doctrine, which he forthwith attempted.

ARAMÆ'A (from the Hebrew word *Aram*, signifying the highland in opposition to the lowland of Canaan) includes the whole of the country situated to the north-east of Palestine. Its boundaries though not rigorously defined, were as follows: N., by Mount Taurus; E., by the Tigris; S., by Arabia; and W., by Arabia, Phœnicia, and Lebanon. It embraced the countries known to the Greeks by the various names of Syria, Babylonia, and Mesopotamia. *The Aramaic language*, a branch of the Semitic, was common to the whole country, and was divided into two principal dialects—the west Aramaic or Syriac, and the east Aramaic, or, as it is improperly termed, the Chaldee. The former was that spoken almost universally in Palestine in the time of Christ. Ever since the Babylonian captivity, the pure Hebrew, in which

the whole of the Old Testament, with the exception of a few chapters in Daniel and Ezra, had been written, had gradually given place to the Aramaic. The Aramaic version of the Bible was that used in Christ's time, who quotes from it and not from the original Hebrew; as, for instance, the beginning of the 22d Psalm, which he repeats on the Cross. The Talmud, especially the Babylonian, has a large admixture of Aramaic elements. The Aramaic dialect is, in general, the harshest, poorest, and least elaborate of all the Semitic languages, and has now almost entirely died out, and given place to the Arabic and Persian. Indeed, it is only found living among some tribes in remote districts in the mountains of Kurdistan, and in two or three villages in Syria; yet it is considered highly probable that it is the root of the whole cluster of Semitic tongues.

ARA'NDA, Pedro Pablo Abarca de Bolea, Count of, born in 1718 of a distinguished Aragonese family, at first embraced a military career; but having evinced a remarkable spirit of observation, he was appointed by Charles III. ambassador to the court of Augustus III., king of Poland; which post he filled for seven years. After his return, he was appointed captain-general of Valencia, and in 1766 recalled to Madrid on account of its disturbed state, and the presidency of the Council of Castile was bestowed on him. A. not only soon restored order in the capital, but limited the power of the Inquisition, procured the expulsion of the Jesuits from Spain, and carried the salutary terror of government into the recesses of the Sierra Morena, then infested by hordes of ferocious banditti. Like many other reformers, he was not able fully to carry out all his liberal intentions. In 1773, he was removed from his high position through the influence of the clergy, the Dominican monks especially, and sent as ambassador to France. Grimaldi succeeded him in his office, and after him Count Florida Blanca; but when the latter lost his office in consequence of court intrigues, A. returned to his position; soon however, to lose it again through the agency of Godoy, Duke of Alcudia, the queen's favorite. He, however, still remained President of the Council of State, which he had organized; but upon his expressing his views regarding the war with France, he was banished to his native province of Aragon, where he died in 1799.

ARA'NEA and ARANE'IDÆ. See Spider.

ARANJU'EZ (a corruption of the Latin *Ara-Jovis*, altar of Jupiter), a town in the province of Madrid, Spain. It is situated on the left bank of the Tagus, 28 miles south south-east from Madrid, in a beautifully wooded valley, and is now connected with the Spanish metropolis by a railway. The town is built in the Dutch style, has broad and regular streets intersecting each other at right angles, and a population of 8154. It is famed for its palace and gardens. The former was long a favorite resort in spring of the royal family, during which period A. occasionally reckoned as many as 20,000 inhabitants; the latter were laid out by Philip II., who built a palace also, for there was only a shooting villa here during his father's time, but a fire destroyed a portion of it, and more was taken down by Philip V., who reconstructed the edifice in French style. The present château was completed by Charles IV. On account of its gardens, the natives call A. 'the metropolis of Flora.' These gardens are interspersed with numerous summer-houses, the most celebrated of which is the *Casa del Labrador*, or Laborer's Cottage; but their most splendid ornament are the great elm-trees brought from England by Philip II., which thrive magnificently. They radiate out from a central plot in 12 distinct rows. A. is known historically for the treaty of alliance concluded here between France and Spain on April 12, 1772, and as the scene of the abdication of Charles IV. on March 18, 1808.

ARANY, Janos, next to Petöfi the most distinguished of modern Hungarian poets, was born at Nagy-Szalonta, 2d March 1817. His father was a poor peasant, who spared no pains to get him into the church. In 1832, he entered the college at Debreczin, where he distinguished himself by his diligence; but unable to restrain his love of adventure, he joined, in 1836, a company of strolling-players, with whom he traveled about for several months, till, driven by necessity and an upbraiding conscience, he hurried home to do what he could for the support of a now blind and aged parent. At Szalonta he worked as a teacher of Latin and as a notary. When the Kisfaludy Society of Pesth offered a prize for the best humorous poem, A. sent in anonymously his *Az elveszett Alkotmány* (The lost Constitution of the Past). He was successful. Thus emboldened, he ventured, in 1847, to forward to the same society the first part of a trilogy, *Toldi*. Struck by the beauty of this purely national effort, the members published it at their own expense, and again rewarded the author. A. soon became a popular favorite, even in the lowest ranks of the community. In 1848 appeared his *Murány Ostroma* (Conquest of Murány), which, received less attention owing to the political excitement of the time. The poet himself took a slight part in the revolution, but after the dismal termination of the war, he was allowed to return to his country. He was afterwards professor of Hungarian literature, director of the Kisfaludy Society, editor of a journal, and secretary of the Hungarian Academy (1865—1870). Later works are, *Katalin*, the second part of *Toldi*, 2 vols. of lyrics, the first part of another trilogy, *Buda Halàla*, and a humorous poem recounting his early adventures (1874). Part of *Buda* has been translated into English. He died 28th Oct. 1882.

ARAPAI'MA, a genus of fresh-water fishes, the largest known fresh-water fishes in the world. They are found in the rivers of South America, and are sometimes taken in the Rio Negro 15 feet in length and of the weight of 4 cwt. They are taken with the harpoon, and are highly esteemed for food, both fresh and salted. In the salted state they have begun to form an article of commerce, and are conveyed in large quantities to Para. The genus *A.* belongs to the family of *Clupesocidæ*, a family of malacopterous fishes, allied to the *Clupeidæ* or herring family, and is remarkable for the mosaic work of strong, bony, compound scales with which the body is covered. About six species are known.

A'RARAT (Airarat, in the old Armenian dialect; i. e., the plains of the Aryans), the ancient name of the fertile plateau through which flows the river Aras or Araxes. It occupies the center of the mountainous region of Armenia, belonging partly to Turkey and partly to Russia. Notwithstanding the passage in Genesis viii. 4, where it is said that the ark rested 'on the mountains of Ararat,' it has become common to give the name A., not to the entire range, but to the mountain called by the Armenians Massis Lensar—i. e., 'mountain of the ark' (known among the Turks as Aghri-Dagh, 'steep mountain;' and among the Persians as Koh-i-Nûh, 'Noah's mountain'). It rises in two volcanic cones, known as the Greater and the Lesser Ararat; the former which attains the height of 17,212 feet above the level of the sea, is covered with perpetual snow. It is the highest elevation of Western Asia, and since the war of 1827 it forms the point where the Russian, Turkish and Persian territories meet. In 1840 the form of the mountain was partially changed by a frightful and destructive earthquake. Previous to this period, at the base of the mountain, and at a point where a stream runs from a wild gorge, there stood the village of Arguri or Aguri. It was surrounded by gardens and orchards, and inhabited by upwards of 1000 inhabitants. In the ravine, 2300 feet above the village, stood the Armenian convent of St. James; and 1000 feet higher still, a chapel dedicated to St. James. The beauty and mild air of the district made Anguri a favorite summer resort of the richer inhabitants of Erwan. It was to undergo a great change, however. On the 20th of June 1840, dreadful shocks of earthquake were felt. Great masses of the mountain were thrown into the plain, the ravine was closed, the convent and chapel disappeared, and the village, and the gardens which surrounded it, were buried under rocks, earth, and ice, and with the inhabitants utterly destroyed. Tournefort made a partial ascent of the mountain in 1700; since then, ascents have been made in 1829 by Professor Parrot of Dorpat and his companions; in 1850 by Colonel Chodzko, and a large party of Russians engaged in the Transcaucasian triangulation; in 1856 by Major Robert Stuart; and in 1870 by Dr. G. Radde and Dr. G. Sievers. These naturalists, the former of whom is director of the museum at Tiflis, have carefully explored the mountain and district in which it is situated. See their 'Reisen in Armenschen Hochland' (*Petermann's Mittheilungen* for 1871); also the *Transcaucasia and A.* of Mr. Bryce, who made the ascent in 1876.

A'RAS, the ancient *Araxes*, a river of Armenia, formed by the junction of the Bingol-Su and the Kaleh-Su, and uniting its waters with those of the Kur (ancient *Cyrus*) after a course of about 500 miles. The main stream is the Bingol-Su, which rises in the Bingol-Tagh, in lat. 41° 30′ N. and long. 41° 10′ E.; and flowing N.N.E., is joined a little below Hasan-kaleh by the Kaleh-Su, after which the combined stream is called the A. It then flows eastward, forming for some time the southern boundary of the province of Kars, till it is joined by the Arpa which flows into it from the north. After this, it divides Russian and Turkish Armenia; at some distance to the south of Erivan it turns to the south-east, along the base of Ararat; soon after which it receives the waters of the Zenghi, a river descending southward past Erivan. Near Djulfa it runs eastward for about 60 miles; after which it runs to the north-east for upwards of 125 miles, till it is joined by the large river Kur, descending from the Caucasus through Georgia. Their united waters, after a short eastward course, turn suddenly to the south, and fall by three mouths into the Gulf of Kizilgatch, in the Caspian, in lat. 39° 20′ N.

ARA'TUS, of Sicyon, a distinguished Greek statesman, was born about 271 B.C. His youth fell among the party strifes of his native town, in which his father, Clinias, met his death; and he himself was only saved by the efforts of his aunt, who had him secretly conveyed to Argos, whence he returned, in his twentieth year, and liberated Sicyon from its tyrant, Nicocles, 251 B.C. Supported by Ptolemæus Philadelphus, A. restored the republican form of government to Sicyon, and united it with the Achaian League, of which he was appointed general, 245 B.C. During his

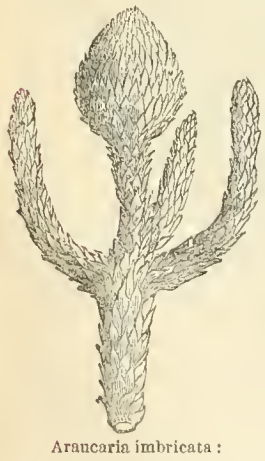
honorable but checkered career, this office was conferred on him seventeen times. His great object was to unite the Greek states, and form out of them an independent nation; but this was thwarted by their mutual jealousies. A. was a brave general, a skilful tactician, and a disinterested patriot. He died by poison administered to him by command of Philip III. of Macedon.

ARA'TUS, of Soli (or Pompeiopolis, in Cilicia), wrote about 270 B.C., a Greek didactic poem, entitled *Phænomena*, founded on the astronomical system of Eudoxos of Cnidos, and appended to it another poem, *Diosemeia*, giving rules for prognostication of the weather. A pure style and correct versification mark both poems, which were translated into Latin by Cicero, Cæsar Germanicus, and Rufus Festus Avienus. A. was a native of the same province as St. Paul, who quotes from him in his speech on Mars' Hill: 'For as certain of your own poets have said, We also are his offspring.' The best edition is that by Buhle, 2 vols. Leipsic, 1793—1801.

ARAUCA'NIA, the country of the Araucos or Araucanian Indians, in the south of Chili. The Chilian province of Arauco, lying between the rivers Biobio and Valdivia, was incorporated in 1852; but the Indians occupy a large territory in Arauco and the more southerly province of Valdivia, and still maintain their independence of the Chilian republic. The Araucanians are interesting as furnishing the only example of Indian self-government in the presence of the European races. Their country is divided from north to south into four parallel regions, varying from each other, with tolerable regularity, in soil and climate. These are the coast region, the plain region, the region of the Lower Andes, and the region of the Higher Andes. The productions of A. are similar to those of Chili. The population cannot be accurately estimated on account of the independence of the nation; but the most recent estimates set down the aboriginal population at about 70,000 souls.

A. has the proud distinction of being the only portion of the New World that has never received the European yoke. From the days of Pizarro and Almagro downwards, it has uniformly vindicated its freedom—its wars of independence having lasted, with intervals of precarious truce, from 1537 to 1773. During the war between Spain and the Chilian colonists, A. remained neutral. In 1861, a French adventurer named De Tonneins, ingratiating himself with the Indians, was elected king of A. He has twice carried on war unsuccessfully with Chili.

ARAUCA'RIA, a genus of plants of the natural order *Coniferæ* (q. v.) or Pines, consisting of lofty trees, natives of the southern hemisphere, and distinguished by having the male and female flowers on separate plants, the pollen of the male flowers contained in 10—20 cases pendent from the apex of each scale, the female flowers two under each scale; each having one ovule. The species are all evergreen, the leaves broader than in pines and firs, which, however, the trees resemble in their general manner of growth. *A. imbricata*, sometimes called the Chili Pine, a native of the Andes of Chili, forming forests on their western declivities, attains a height of 150 feet, the trunk quite straight and free from knots. The bark of the young trees is studded with leaves from the base upwards, even until 12 or 15 years of age. The branches are in whorls of 6, 7, or 8. Young trees have branches almost from the ground; old trees have tall naked stems, with a crown of branches. The female strobile (cone) is roundish ovate, 8—10 inches in diameter, the scales terminated by a long awl-shaped point, the seeds wedge-shaped, and more than an inch in length.



Araucaria imbricata: End of a branch, much reduced, showing the mode of ramification, and the manner in which the leaves are imbricated.

Araucaria imbricata: Sketched in the Botanic Gardens, Edinburgh.

The outer and inner bark of full-grown trees are each 4—6 inches in thickness; the outer bark of a cork-like texture; the inner, fungous and porous. From both outer and inner bark, and indeed from all parts of the tree, resin flows readily and in great abundance. The leaves are lanceolate, about 1½ inch in length, and ¼ inch in breadth near the base, sharp-pointed. The timber is heavy, solid, hard, fibrous, yellowish white, and beautifully veined. It is very suitable for masts of ships. The resin, which is white, has a smell like frankincense, and a not unpleasant taste. It is applied as a plaster to contusions. The seed is pleasant to the taste, not unlike the chestnut, and is a most important article of food to the Indians. It is eaten raw, boiled or roasted. A spirituous liquor is also distilled from it. A single strobile sometimes contains between 200 and 300 seeds, and one tree may be seen loaded with 20 or 30 of these great strobiles. This Araucaria was introduced into Britain in the end of the last century, and is now pretty frequently planted. It promises to add a new feature to British landscapes, as other trees of the same order, particularly the larch and spruce, have done before, and will probably prove important in an economical point of view. It is the only species which seems suited to the climate of Britain. *A. Brasiliana*, the Brazil Pine, has loosely imbricated lanceolate leaves, and a looser and more spreading habit than *A. imbricata*. The seeds or nuts are sold as an article of food in Rio Janeiro. The resin which exudes from the tree is mixed with wax to make candles. *A. excelsa*, now called *Eutassa excelsa* (and by some *Altingia*), the Norfolk Island Pine, a native of Norfolk Island, New Caledonia, &c., attains a height of 160—200 feet, free from branches to 80—100 feet, and with a trunk sometimes 11 feet in diameter. The wood is white, tough, close-grained, and so heavy as almost to sink in water. The leaves of the young trees are linear and spreading; those of the adult are ovate, and closely imbricated. The strobiles are ovate, 4—5 inches in length. *A. Cunninghamii*, now also ranked in the new genus *Eutassa* or *Altingia*, the Moreton Bay Pine, a native of the shores of Moreton Bay and banks of the Brisbane River in New South Wales, very much resembles the last. It attains a height of 60—130 feet, and a diameter of 4—8 feet. The leaves of the adult trees are lanceolate and imbricated. The wood is yellowish, and is used for boat-building house-carpentry, and the common kinds of furniture. The large seeds of *A. Bidwillii* are used for food by the natives at Moreton Bay.

Certain fossil *Coniferæ* found in carboniferous sandstone have received the name *Araucarites*. Livingstone found a forest of large silicified trees near the Zambesi, which Mr. Quekett, on examination of specimens, ascertained to be 'silicified coniferous wood of the Araucarian type.' Fossil trees of the same type occur in the carboniferous strata of Britain. A trunk, for instance, 47 feet long, was found in Craigleith Quarry, near Edinburgh, in 1830.

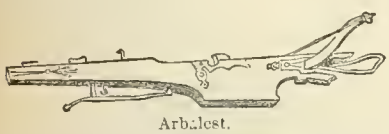
ARAUJO, D'Azeve'do Anto'nio, afterwards Count da Barca, was born at Sá, in the neighborhood of Ponte de Lima, in Portugal, on the 14th of May 1754. At the age of 11, he was sent to Oporto to study under his uncle, who held a high military command there. In 1787 he was appointed Portuguese ambassador to the Hague. Before entering on his duties, he visited England, where he omitted no opportunity of obtaining a knowledge of English manufactures, commerce, politics, &c. He next proceeded to Paris, where he similarly employed himself. Soon after his arrival at the Hague, he found himself entangled in political difficulties. The French Revolution had broken out, but the part which he played in the complication of political affairs which ensued falls to be treated more properly under the History of Portugal (q. v.).

At length he threw up his ambassadorship, and traveled through Germany, enlarging the sphere of his studies. He paid especial attention to mineralogy and chemistry, and was fortunate enough to become acquainted with Goethe, Wieland, Schiller, Herder, &c. After the Peace of Amiens, A. was sent as ambassador to St. Petersburg; in 1803 he was recalled to Lisbon, to assume the office of Secretary of State; and in 1806 he obtained the highest political dignity in the kingdom. His efforts to introduce the various agencies of civilization, while he occupied this situation, were unremitting. Glass, paper, wool, and cotton manufactures, received liberal encouragement. But the sudden approach of the French army put an end to all his improvements. The royal family, which Bonaparte had formally dethroned in his victorious proclamation, emigrated to Brazil. A. embarked also, taking along with him a complete printing apparatus, his mineralogical collection, arranged by Werner, and all necessary chemical instruments. During the first years of his residence in the New World, he devoted himself assiduously to scientific and literary pursuits; founded a school of medicine and chemistry, introduced the cultivation of tea, an improved machine for sawing wood, and a sugar-alembic, and established a porcelain manufactory. He had also a magnificent garden, the plants of which were scientifically arranged. He died on the 21st June 1817.

ARAU'RÉ, a town of Venezuela, South America. It is situated in lat. 9° 17′ N., long. 69° 28′ W., 60 miles E.N.E. of Trujillo, in a region noted for its fertility in the production of cotton, coffee, cattle, &c. The town itself is rather handsome, and contains 10,000 inhabitants.

ARAVU'LLI, a range of mountains in Western India, extending from about 22° 40′ N. lat., 74° E. long., to 26° 50′ N. lat., 75° E. long. The highest summit is Abu (q. v.). The north-eastern extremity of the range sinks into comparatively low rocky hills. The north-western side is very bold and precipitous, the south-eastern less so. There is no road practicable for wheel-carriages across this range for a distance of 220 miles.

A'RBALEST, ARCU'BALEST, or CROSS-BOW, was a weapon much in use during the feudal times. Its recognized position among military arms may be dated from about the period of Richard I. The smaller kinds of A. were bent by pressing the hand on a small steel lever called the 'goat's foot;' but the larger kinds were bent by placing the foot in a loop or stirrup at the end of the central shaft, and drawing the cord upwards with the hand. At a later period, the bow was made very strong, often of steel; in this form it required a mechanical contrivance, called a 'moulinet,' to bend it. Sometimes ordinary arrows were used with the A., but more usually arrows of a shorter and stouter kind, called 'carrials' or 'quarrels,' were employed; these had a four-sided pyramidal form of head. Occasionally stones and leaden balls were shot from the larger Arbalests. The arbalestiers, or cross-bowmen, carried a quiver with fifty arrows as an armament in some of the battles of the 13th c. They were an essential component of armies of that period, taking up their position in the van of the battle-array; some were mounted, some on foot, and they occasionally wore armor. The supply of arrows or quarrels was carried after them to the battle-field in carts. The A. continued to be a favorite weapon in England throughout the 13th c.; but in the 14th, it gave way to the long-bow, which was found to be a more convenient weapon in battle. The long-bow is described under BOW AND ARROW; and the general military system to which it belonged, under ARCHERS AND ARCHERY.



Arbalest.

ARBALESTI'NA, in the military system of the middle ages, was a small window or wicket through which the cross-bowmen shot their quarrels or arrows at an enemy besieging a fortified place.

ARBE'LA, now Erbil or Arbil, a small town of Assyria, east from Mossul, famous as having given name to the battle in which Alexander finally defeated Darius, 331 B.C. The battle was really fought near Guagamela (the 'camel's house'), to the north-west of A.

ARBITRA'TION is the adjudication by private persons appointed to decide a matter, or matters in controversy, on a reference made to them for that purpose, either by agreement of the disputants or by the order, or on the suggestion, of a court of law. The proceeding generally is called a *submission to arbitration*, or *reference;* the parties appointed to decide are termed *arbitrators* or *referees;* and their adjudication is called an *award*. This mode of settling disputes is not only frequently resorted to by litigants themselves, who are anxious to avoid the delay and expense of proceedings in the public tribunals, but the Statute-Book bears witness to the approval of it by the legislature at various times. An old act, the 9 and 10 Will. III., c. 15, testifies the benefits of A. in strong terms, declaring that 'it hath been found by experience that references made by rule of court have contributed much to the ease of the subject in the determining of controversies, because the parties become thereby obliged to submit to the award of the arbitrators,' and it proceeds to authorize and encourage merchants, traders, and others to put an end to their controversies and quarrels by means of A.; and a modern act, passed in 1833, the 3 and 4 Will. IV. c. 42, ss. 39, 40, and 41, contains still more anxious provisions for rendering references to A. effectual. Since that act was passed, the practice and feeling in favor of A. has increased, so much so that there are recent statutes which contain provisions rendering A., or private reference in certain cases, compulsory. The Railway Acts of 1845, the Public Health Act of 1848, Common Law Procedure Act of 1854, and Masters and Workmen Acts are modern examples of this legislative peculiarity.

The matters that may be determined by an arbitrator are all personal disputes and differences which might otherwise be made the subject of controversy in the courts of civil jurisdiction. Thus breaches of contracts generally, breaches of promise of marriage, trespass, assaults, charges of slander, differences respecting partnership transactions or the purchase price of property, and questions relating to tolls or the right to tithes, may all be referred to A. Questions relating to real property may also be referred, such as those relating to the partition of lands of joint tenants or tenants in common, to settlements of disputed boundaries—to differences between landlord and tenant respecting waste—and to the title to land. Pure questions of law may also be referred to the decision of an arbitrator. An arbitrator may have, therefore, to determine the liability of a party on a promissory-note or bill of exchange, or to construe an act of parliament, or to give a judicial opinion on the effect of a will or deed. Actions at law, and suits in equity, may also be settled by A.; and this kind of reference may be made at any stage of the proceedings, sometimes even after verdict, and probably by analogy, after decree in equity. Questions relating to the future use and enjoyment of property, and future or anticipated differences between parties, may likewise be referred.

A matter, however clearly illegal, cannot be made the subject of a valid reference. But where transactions between parties have been brought to a close by a general award, apparently good, the courts have refused to re-open them on a suggestion that some legal item has been admitted in account.

There are certain matters which are specially referred to A. by statute. Besides those we have already alluded to, the following matters are all referrible to A.: Questions relating to the expenses of prisoners, under 28 and 29 Vict. c. 126; to the regulation of municipal corporations in England and Wales, under the 5 and 6 Will. IV; c. 76; to the laws concerning prisons, under the 5 and 6 Vict. c. 98; to disputes between masters and workmen, under the 5 Geo. IV. c. 96, amended by 35 and 36 Vict. c. 46; to the laws relating to savings-banks, under the 26 and 27 Vict. c. 87; to the land rights and other possessions of certain ecclesiastical and collegiate corporations, under the 2 and 3 Will. IV. c. 80; to the management and improvement of episcopal and capitular estates in England under the 17 and 18 Vict. c. 116; to the conveyance of mails by railways, under the 1 and 2 Vict. c. 98; to insolvents and to insolvency, bankruptcy, and execution, under the Bankruptcy Act, 1869, 32 and 33 Vict. c. 71; to the constitution of companies incorporated for carrying on public undertakings, under the 8 and 9 Vict. c. 16; to the taking of lands for undertakings of a public nature, under 8 and 9 Vict. c. 18; to the metropolitan sewers, under the Metropolis Management Acts, 18 and 19 Vict. c., 120, 19 and 20 Vict. c. 112, 25 and 26 Vict. c. 102, and 34 and 35 Vict. c. 47; to friendly societies, under the 17 and 18 Vict. c. 56, and the 38 and 39 Vict. c. 60.

Under these acts of parliament, the class of cases which may, or which must, be referred to A., have been greatly enlarged. The railway acts, in particular, have largely contributed to this kind of amicable determination, although the parties in such cases cannot be said to have much discretion in the matter. Under the provisions, again, of the Judicature Act, 1873, and the Act 17 and 18 Vict. c. 125, ss. 3 and 6, parties may be compelled by the court to refer to official referees matters which involve intricate accounts or scientific or local examination.

Among the questions that cannot be referred to A. are matters arising out of the the administration of the criminal law in the case of felonies and relating to agreements or transactions against public policy. Felonies and offences of a public nature cannot be referred, because the public safety and good require them to be punished and for this purpose they can only be properly tried in one of the ordinary courts of the country.

With respect to matters which cannot be referred on account of their being against public policy, the rule is so obviously just that no illustration is required.

But there are certain misdemeanors which may be either settled by agreement or by means of an A., on a principle of very general application stated by Chief-justice Gibbs—that where there is a remedy, by action as well as by indictment, a reference of the matter in controversy is good. And in these cases of misdemeanor, a compromise or settlement under a reference may be made, even after conviction, but with the sanction of the court.

As to the parties who may make a reference to A., it may be stated generally, that every one capable of making a disposition of his property or release of his rights may make a submission to an award, and in this category may be placed a married woman, who has a separate estate settled to her separate use, and there are even cases where a reference between a husband and wife has been held valid; and of course a husband may submit to A. differences respecting his wife's personal estate which has not been settled to her separate use.

Respecting the powers of infants or persons under age to submit to A., there are numerous decisions in the court of law and equity: but they go upon refinements and nice distinctions more suited for the professional lawyer than for the ordinary reader, and we therefore do not think it necessary to give any explanation of them in a popular article such as this professes to be.

Partners and corporations may make references to A. on the principles already explained, and according to the relation in which they stand to the matter in dispute.

Those who cannot submit to A. are persons in the following position: Persons who cannot contract; married women without

an estate settled to their separate use; and along with them, as laid down in old ante-reformation books, persons professed in religion, and persons under duress. There is an exception to the incapacity of married women to refer to A. where the husband, by exile, banishment, or other cause, is held to be civilly dead, and when he is an alien enemy. To these exceptions it may be added, that in suits respecting the property of charities the Court of Chancery will not permit a reference, however advisable such a course may seem, unless the attorney-general gives his consent.

It has generally been the opinion of the legal profession, and held to be the doctrine of the courts, that a reference by the consent of counsel in a cause is binding on his client; and Lord Chancellor Eldon once said, that it was for the counsel to consider whether he was authorized to refer, and if so, he (the chancellor) would act on the consent so given; and the right and privilege of counsel to make a reference has been very strongly laid down in the Scotch courts, But a notable case in the Court of Common Pleas (Swinfen *v.* Swinfen), where a compromise by the counsel was successfully resisted by the client, somewhat unsettled the English law on this subject; and now the feeling of the Bar in England is, that it is unwise to refer or compromise a litigation on the independent authority of counsel.

Submissions to reference may also be made by executors and administrators, by trustees, by the committee of a lunatic, and by the officers of a public company, who is authorized by a statute to sue and be sued in the name of the company. And there are persons especially empowered to refer by the statutes which we have already enumerated.

Disputes may be referred to A. in any manner that expresses the agreement or understanding of the parties to be bound by the decision of the arbitrator; and for this purpose no formal submission, either verbal or written, is necessary; but the arrangement must be such as manifestly to show an intention to have the difference concluded by a private ajudication in the nature of an award. But where the submission is in writing, it must be executed in due form. A testator, however, cannot exclude his will from litigation by a proviso, that all differences respecting it shall be referred to A., although it is thought that the parties benefited by the will might themselves so refer. Generally speaking, it is advantageous to make the A. in such a form as that the award may be made a rule of court—that is, may be adopted by a court of law as its judgment on the matter submitted, a proceeding that affords an obvious facility in enforcing the award; and for this purpose it is necessary to make the procedure conformable to the directions of the statutes 9 and 10 Will. III., and 3 and 4 Will. IV., already referred to. Where the submission is merely verbal or constituted by a private bond or deed, it is liable to be capriciously revoked, and proceedings on the award, in such a case, can only be taken in the Court of Chancery.

The arbitrator ought to be a person who stands perfectly indifferent between the disputants; but there are no other particular qualifications for the office. And the choice by parties of the person who they agree shall decide between them, is perfectly free. Some legal writers have even gone so far as to maintain, that not only infants, and married women, but even idiots and lunatics, can be arbitrators, on the argument that every person is at liberty to choose whom he likes best for his private judge, and he cannot afterwards object to the deficiences of those whom he has himself selected. But this, it is clear, is going too far, and the policy of the law would certainly be interposed against such extreme cases. It is better to state the rule to be, that on the condition that the party selected is of ordinary intelligence, the choice of an arbitrator is absolutely unfettered. The only exception to this rule is the case of a party who, by office or position, is the person pointed out for the duty under a reference made by statute. In matters of complicated accounts, mercantile men are generally preferred. In other cases, it is usual to appoint barristers who, being accustomed to judicial investigations, are able to estimate the evidence properly, to confine the examination strictly to the points in question, and, in making the award, to avoid those informalities in respect of which it might afterwards be set aside. Both time and expense are thus saved by fixing on a professional arbitrator. It has, indeed, been wisely remarked, that an arbitrator should endeavor to arrive at his conclusions upon the same rules and principles which would have actuated the court for which he is substituted—a rule of conduct that obviously points to the expediency of a lawyer being the referee. But an arbitrator is not bound by the mere rules of practice which prevail in the ordinary courts of justice, and he has been held justified in allowing interest on both sides of an unliquidated account, although such a determination was against the practice of the Court of Chancery, where the suit, which had been referred, had been commenced.

The proceedings before an arbitrator are regulated according to the peculiar circumstances of the case submitted, but generally it is advisable to conduct them according to the forms observed in courts of law, and they usually are so conducted. Each of the parties furnishes the arbitrator with a statement of his case, which is done by giving him a copy of the briefs on each side; and on the day appointed he proceeds to hear them (either in person or by their counsel or attorneys), and to receive the evidence on each side, nearly in the same manner as a judge at an ordinary trial. Having so heard the case, the arbitrator proceeds to make his award, which need not necessarily be in writing, for a verbal award is perfectly valid; but in practice it is usual for the arbitrator to make his award on paper stamped with the proper award stamp, and this he delivers to the successful party. The unsuccessful party gets a copy of the award on unstamped paper. This award in its effect operates as a final and conclusive judgment respecting all the matter submitted, and it binds the rights of the parties for all time.

An award may be set aside on the ground of corruption and fraud in the arbitrator, and for any material irregularity or illegality appearing on the face of the proceedings. But the tendency of the courts is to favor arbitrations and maintain awards, unless such serious grounds as we have referred to can be substantiated.

Where there are two arbitrators, the submission often provides that in the case of their differing in opinion the matter referred shall be decided by a third person, called an umpire, who is generally appointed under a power to that effect, by the arbitrators themselves. But they cannot make such an appointment unless specially authorized so to do by the terms of the submission. This umpire rehears the case, and for this purpose is invested with the same powers as those possessed by the arbitrators, and bound by the same rules.

In Scotland an A. takes place in virtue of a written submission executed by the parties in favor of the chosen referee, who there is called an arbiter, instead of arbitrator, as in England; and his award is called a decree-arbitral. This submission is in the form of a regular deed, and is said to be general or special, according to the nature of the matters submitted by it, the submission specifying all the particulars of the reference, and the name of the referee—the arbiter's powers and duties, which, in the ordinary case, are of the most comprehensive character—the specification of the time within which the award or decree-arbitral is to be made—a clause obliging the parties to perform the award under a specified penalty; and other anxious provisions, which are all carefully specified in the submission. The case then proceeds before the arbiter, generally according to the forms observed in the ordinary Scotch courts; and the arbiter makes his award in a very solemn manner, the decree-arbitral commencing with a recital of the submission and of all the procedure—and after stating that the arbiter has ripely considered the whole matter, and has 'God and a good conscience before his eyes,' it gives the arbiter's judgment, and among other things ordains the submission and decree to be recorded according to the clause of registration in the former, and the extract from the registry so made forms a judgment which may be put in execution by either party against the other. The decree-arbitral, like the submission itself, must be executed and attested in the form of a regular deed. Where there are two arbiters, the submission usually provides, that in the event of their differing in opinion, they shall name an umpire or oversman, as he is called in Scotland, whose judment is final.

In conclusion, and as a remark on A. generally, it only remains to be stated, that of course, from the nature of the case, there can be no appeal on the merits of the dispute submitted to any public tribunal whatever. See ARBITRATION in AM. SUPP.

ARBO'GA, an ancient city in Sweden, in the province of Westmannland, on a small river of the same name by which, with the aid of a canal, the lakes Hialmar and Mälar are united. A. used to be an important commercial town, but it has now sunk into insignificance, and only possesses an historical interest from the antiquities in its neighborhood. Of all its churches, cloisters, and chapels there only now remain the town and parish churches, the former with an altar-piece of Rembrandt's. Several kings of the family of Vasa have resided here. Church assemblies were held here in 1396, 1412 1417, 1423, and 1474; diets in 1435, 1440, 1471, 1529, and 1561, in which last year also certain articles, known as the Arboga Articles, were passed by which Eric XIV. was enabled to limit the power of the nobles; and in 1625, Gustavus Adolphus issued an edict here, commanding that the copper coin of the realm should contain its full worth of copper. Pop. (1880) 3833.

ARBORE'SCENT (from Lat. *arbor*, a tree), a term applied to plants to signify that they possess either altogether, or in some measure, the character of trees. Even the dwarf willows and birches, on the confines of polar or alpine perpetual snow, are described as the A. vegetation of these regions.

ARBORICU'LTURE (from Lat. *arbor*, a tree), a term literally signifying the cultivation of trees, but in use generally restricted to the planting and management of timber trees, or employed as exclusive at least of the cultivation of fruit trees, which is a brauch of horticulture or gardening.

The ancients practised A. to some extent, but chiefly with the view of beautifying their villas, or of forming public walks in the

vicinity of cities. It is only for similar purposes, and on a very limited scale, that A. is yet anywhere practised in America. The planting of timber trees for economical purposes, or with a view to profit, is unnecessary whilst natural forests are abundant, and can scarcely be referred even in Britain to an earlier period than the beginning of the 16th c., nor did it become at all general till a much later date. The early forest laws of England, as of other feudal countries, had reference chiefly to game, for the sake of which it was, and in order to the enjoyment of the chase, that large tracts were depopulated and converted into *forests* by the first Norman kings. Plantations for timber and fuel were, however, certainly made in England in the 16th c.; and the importance of the subject was urged on public attention by authors of that period. In the 17th c., the greatly increased demand for oak, for the building both of ships and of houses, gave a new impulse to A., which attracted more than ever before the attention both of the government and of the great landowners; the publication of Evelyn's *Sylva* also did more than any previous work to promote a taste for it. It was in this century that nurseries for forest trees were first established. It was not until the beginning of the 18th c., that the first extensive plantations were made in Scotland, nor until towards the end of that century that A. became general in that country or in Ireland. How much the very landscape has been changed by it—how great a difference has been made by the conversion of bleak hills and barren wastes into woods—how much the scene has been changed by the new forms of foreign trees, some of which are now in many districts more abundant, than those which are indigenous, it is not easy to imagine; and how much these changes have promoted and are indicative of improvements in agriculture and increased productiveness of fields, is equally difficult to estimate.

The A. of France, Germany, and other parts of Europe, to this day, consists in a great measure of the management of natural forests; and in the more eastern parts of the continent this is almost exclusively the case. Without a careful management of the natural forests, many districts of France and Germany would soon be destitute of fuel; by means of it an increased supply of valuable timber is also obtained; and extensive domains belonging to the state, or to private proprietors, are rendered much more productive. It is in Germany that the management of the forests has received the greatest attention, and has been most systematically and scientifically conducted.

The forests trees of Britain, and of temperate climates generally, are conveniently divided into two classes—the one consisting of coniferous trees or pines and firs (*Nadelholz*, i.e., the 'needlewood' of the Germans), the other including all other kinds (*Laubholz* i.e., the 'leaf-wood' of the Germans); the latter being sometimes subdivided into *hard-wooded trees*, of which, the most important in Britain are oak, ash, elm, beech, birch, hornbeam, sycamore, walnut, and chestnut; and *soft-wooded trees*, as willow, poplar, lime, alder, and horse-chestnut. Of these and other trees, of their particular uses, and of the soils and situations to which they are adapted, notice is taken in separate articles.

Plantations are generally formed in Britain by means of trees raised from seed in a nursery; but sometimes also by sowing the seed on the ground intended for the plantation; in which case, if circumstances permit, a crop of grain is often sown along with the seeds of the trees, as these do not in general vegetate very soon; and the young plants derive advantage from the absence of choking weeds when the grain-crop is reaped, and from the protection afforded by the stubble. It has been supposed by some, but there is no sufficient evidence in support of the opinion, that more healthy and vigorous trees are obtained by sowing on the spot than by planting those which have been raised in a nursery. However, only very young trees can be planted with advantage, those which have attained a greater size requiring a degree of attention far beyond what is possible in plantations even of very moderate extent. The time of planting is from November to February. The most approved mode of planting is in small pits, in which the roots are disposed in a natural manner, and which are then carefully filled up with earth; but it is often thought sufficient when the tree to be planted is very young, to make a slit for it with a spade, or two slits, one at right angles to the other in the form of the letter T. Other methods are also adopted, particularly for rocky situations, in which the spade cannot be used. Economy is often a consideration of great importance in determining the mode of planting.

The formation of plantations by the sowing of seed has been more generally practised on the continent than in Britain. In this way the vacancies in the natural forests of France and Germany are filled up. In this way also great sandy tracts have been covered with wood on the coasts of Pomerania and of France. This has particularly been accomplished on a scale of extraordinary magnitude in the downs of drifting sand, between the rivers Adour and Gironde. The operations there were begun by M. Bremontier in 1789, and deserve to be mentioned as perhaps the most important operations in A. that have ever been performed in the world. Vast forests of pinaster now occupy what was originally loose sand destitute of vegetation.

Too little attention has hitherto been generally paid to the adaptation of the kinds of trees that are planted to the soil and climate; and to this cause many failures in A. are to be ascribed. Some trees grow well even in exposed situations, and are fit to be employed in these, either to form entire plantations, or to occupy the outer part, and so to shelter other trees, which in general are not planted until the outer zone or belt of the most hardy kinds is somewhat advanced; some succeed only in rich soils; some are incapable of enduring the sea-breeze; others, as the sycamore, the elder, and the pinaster, are comparatively unaffected by it. Some trees suffer from an amount of moisture from which alders or willows would rather derive advantage; but, in general, the thorough drainage of the land intended for a plantation is one of the circumstances most important to its success.

To the necessity of this thorough drainage we must look as compensating, or more than compensating, the influence which woods exercise in condensing the moisture of the atmosphere, and in rendering a climate cold and damp; marshy soils being in this respect still worse. The shelter afforded by plantations judiciously disposed, whether in belts or otherwise, is also of great importance in rendering them suitable for that improved agriculture in which thorough draining is of the first necessity, and which is always productive of amelioration of climate. The influence of plantations is therefore, upon the whole, beneficial, although vast masses of forests are injurious to climate; and it must be admitted that in some localities the planting of trees has been carried to excess, so that fields often suffer, particularly in autumn, from want of free circulation of air, and the landscape is often restricted to very narrow limits. The remedy in such cases is obvious; and it not unfrequently happens that within a short distance new plantations might be formed with every prospect of benefit.

Much has been written about the pruning of forest trees, with a view especially to the production of taller and straighter stems; and considerable difference of opinion exists as to the extent to which pruning should be practised. It is, however, very generally delayed till the branches to be removed have attained too great a size, and is then very rudely performed, to the spoiling of the timber rather than to the improvement of it. The practice of leaving *snags*, instead of cutting branches clean off, has particularly bad effects. Pines and firs, from their manner of growth, need pruning less than trees of other kinds. When trees have been planted, not merely for profit but for ornament, this ought to be remembered in pruning, which, however, is too often intrusted to persons utterly devoid of taste; and trees which, as they naturally grew, were very beautiful, are so treated with axe and saw that they become deformities instead of adorning the scene.

In forming plantations, different kinds of trees are very generally mixed, although masses of one particular kind are also frequently planted. It is usual, however, to plant along with those which are destined most permanently to occupy the ground, trees of other kinds as *nurses*, to be gradually removed as the plantation advances in growth. For this purpose, spruce and larch are more generally employed than any other tree; although Scotch fir and birch are also deemed suitable for certain situations. The removal of some of these nurses affords the first returns of profit from the plantation, which is afterwards thinned from time to time. Plantations far more frequently suffer from being thinned too little, than from being thinned too much. To the want of proper thinning is to be in part ascribed the failure of many of those narrow belts of *planting* which are too common in Scotland, and which having been intended for shelter, very imperfectly serve their purpose, and seem to have suffered from the hardest usage themselves. The thinning of a plantation which has been allowed to grow too thick, must, however, be very gradually performed, that it may be beneficial, and not injurious. After a sudden thinning, a plantation sometimes ceases to thrive, and many trees are often laid prostrate by the next storm; for trees accommodate themselves both in their roots and branches to the situations in which they grow.

A considerable number of years must elapse before any pecuniary return is derived from a plantation, yet this mode of employing soils is often found to be the most remunerative of which they are capable, even without reference to the improvement of adjacent lands to which shelter is afforded; and the increased demand for timber in Britain, for *sleepers* of railways and other purposes, tends to the still further encouragement of A.

The resinous products of pine-woods are not considered as a source of profit in Britain; but the tar, turpentine, and resin obtained from them in some parts of Europe, form articles of commerce. The great pinaster plantations already mentioned, on the sands between the Adour and Gironde, now yield products of this kind in large quantity. The employment of trees for ornamental purposes belongs not so much to A. as to Landscape Gardening (q. v.). The transplanting (q. v.) of large trees is only practised for ornamental purposes. Hedgerow trees are planted chiefly for ornament, although sometimes they may afford useful shelter; but where this is not the case, they can seldom be reckoned profitable,

as they are injurious to crops. Copse or coppice-wood differs so much, both in its uses and in the mode of its management, from other plantations, that it must be briefly noticed in a separate article.

A'RBOR VI'TÆ (*Thuja*), a genus of plants of the natural order *Coniferæ*, allied to the cypress, and consisting of evergreen trees and shrubs with compressed or flattened branchlets—small, scale-like, imbricated leaves—and monœcious flowers, which have 4-celled anthers, and the scales of the strobiles (or cones) with two upright ovules.—The common A. V. (*T. occidentalis*) is a native of North America, especially between lat. 45° and lat. 49°, but has long been well known in Europe. It is a tree of 40—50 feet high; its branches are horizontally expanded, and the strobiles (cones) small and obovate. The young leafy twigs have a balsamic smell, and both they and the wood were formerly in great repute as a medicine; the oil obtained by distillation from the twigs, which has a pungent and camphor-like taste, has been recently recommended as a vermifuge. The wood of the stem is reddish, soft, and very light, but compact, tough, and durable, bearing exposure to the weather remarkably well. The tree is very common in Britain, but planted chiefly as an ornamental tree, and seldom attaining so great a size as in its native country. It delights in cool, moist situations.—The CHINESE A. V. (*T. orientalis*), a native of China and Japan, which is immediately distinguishable from the former species by its upright branches and larger, almost globose and rough strobiles, is also in Britain, and upon the continent of Europe, a common ornament of pleasure-grounds; but it does not attain so great a size as the preceding, and is more sensible of the cold of severe winters. The balsamic smell is very agreeable. The tree yields a resin, having a pleasant odor, to which high medicinal virtues were formerly ascribed; hence the remarkable name *Arbor Vitæ* (Latin, signifying Tree of Life), given to this species, and extended to the genus. Other species are known, but they are less important than these. In its native country, this species also attains the size of a considerable tree.—

Arbor Vitæ (*Thuja occidentalis*): End of branch, showing mode of ramification and fruit.

There are several other species of *Thuja*, some of which seem well suited to the open air in the climate of Britain, and others require the protection of greenhouses. Amongst the former are *T. plicata*, from Nootka Sound; and *T. dolabrata*, a native of Japan, a tree of great height and thickness, and which will not improbably prove the most important of the whole genus.—A tree, common in North America, and there known by the name of WHITE CEDAR, is sometimes included in the genus *Thuja*, under the name of *T. sphæroidea*, but is more generally ranked in the genus *Cupressus* as *C. thyoides*. See CYPRESS. The timber is highly esteemed, and an infusion of the scrapings is sometimes used as a stomachic.—Closely allied to the genus *Thuja* is *Callitris*. See SANDARACH.

ARBROA'TH, ABERBRO'THWICK, or ABERBRO'THOCK, a seaport town in the east of Forfarshire, situated at the mouth of a stream called the Brothock. Here King William the Lion founded a Tyronensian abbey in honor of Thomas-à-Becket in 1178. The king was interred in it in 1214. In the abbey, Bruce and the Scottish nobles met in 1320, to resist the claim of Edward II. to Scotland. Cardinal Beaton was the last of its abbots. Next to Holyrood, the abbey was the most richly endowed monastery in Scotland. It was destroyed by the Reformers in 1560. Its ruins—which are cruciform, 270 by 160 feet—are very picturesque, presenting lofty towers, columns, Gothic windows, and a fine circular east window, 'the Round O of A.' The chief industries of A. are flax-spinning, jute-spinning, and the manufacture of sail-cloth. The new harbor, begun in 1841, admits vessels of 400 tons; it is protected by a breakwater. Serious damage was done to the wet-dock entrance in 1882 by a gale and high tide. In 1880 above 40 vessels belonged to the port. The chief exports are grain, potatoes, fish, pork, and pavement, chiefly from quarries 8 or 10 miles inland. A. is a royal burgh, and in conjunction with Montrose, Brechin, Forfar, and Bervie burghs, returns one member to parliament. Population in 1881 of parliamentary burgh, 21,758. A. is supposed to be the Fairport of *The Antiquary*, and the Redhead Crags and Coves form some of the scenes in that novel. The famous Bell-rock Light-house is 12 miles south-east of Arbroath.

ARBTU'THNOT, JOHN, a distinguished writer and physician, the contemporary of Pope and Swift, was the son of a Scottish episcopal clergyman, and born at Arbuthnot, in Kincardineshire, shortly after the Restoration. He studied medicine at Aberdeen, where he took his degree. A.'s father was obliged to resign his charge at the revolution. His son's prospects being thus blighted in their own country, they were under the necessity of going abroad to seek their fortune. John removed soon after to London, and there supported himself by teaching mathematics. In 1697 he published an examination of Dr. Woodward's account of the Deluge, which brought him into notice as a person of no common ability. Accident called him into attendance on Prince George of Denmark, who thenceforth patronized him. In 1709 he was appointed physician to the queen, and in 1710 was elected a member of the Royal College of Physicians. On the death of Queen Anne, in 1714, he lost his situation, and his circumstances were never so prosperous afterwards. In 1717, A., along with Pope, gave assistance to Gay in a farce, entitled *Three Hours after Marriage*, which, however, in spite of having the aid of a trio of wits, proved a complete failure. In 1723 he was chosen second censor of the Royal College of Physicians; in 1727 he was made an Elect, and had the honor to pronounce the Harveian oration for the year. He died at Hampstead in 1735. A. was one of the leaders in that circle of wits which adorned the reign of Queen Anne, and was still more nobly distinguished by the rectitude of his morals and the goodness of his heart. He assisted Swift and Pope in the composition of that brilliant satire, the *Memoirs of Martinus Scriblerus*, contributing those portions of it which refer to science and philosophy; and he was undoubtedly the author of the celebrated political *jeu d'esprit*, the *History of John Bull*, which has so often been imitated. Besides several medical essays, he published *Tables of Greek, Roman, and Jewish Measures, Weights and Coins* (London, 1705—1708), a work which was long the best authority on the subject. There is also a philosophical poem of his composition in Dodsley's Miscellanies, entitled *Know Thyself*.

A'RBUTUS, a genus of plants of the natural order *Ericeæ*, containing a number of species, small trees and shrubs, the greater part of which are American. The fruit is fleshy, 5-celled, many-seeded, usually dotted with little projections, whence that of some species has a sort of resemblance to strawberries; the corolla is urn-shaped.—*A. Unedo*, the STRAWBERRY TREE, is a native of the south of Europe, found also in Asia and America, and in one locality in the British Isles, the Lakes of Killarney, where its fine foliage adds much to the charm of the scenery. It requires protection in winter in the climate of Paris. In Britain, it is often planted as an ornamental evergreen. It grows to the height of 20—30 feet, but is rather a great bush than a tree. The bark is rugged; the leaves oblongo-lanceolate, smooth and shining, bluntly serrated; the flowers nodding, large, greenish white; the fruit globose, of a scarlet color, with a vapid sweetish taste. It is, however, sometimes eaten. Of late, excellent alcohol has been made from it in Italy. A wine is made from it in Corsica, which, however, is narcotic, if taken in considerable quantity, as the fruit itself is, if eaten too freely. The bark and leaves are astringent. *A. Andrachne* is also sometimes cultivated as an ornamental plant in Britain, but is impatient of severe frosts. Its fruit, and that of *A. integrifolia*, are eaten in Greece and the east. But all the species seem to possess narcotic qualities in greater or less degree; the fruit of *A. furens*, a small shrub, a native of Chili, so much as to cause delirium.—*A. aculeata*, which abounds at Cape Horn and on Staten Island, is an elegant and most pleasing evergreen, very much resembling the myrtle. It grows to the height of 3 or 4 feet, and produces small white flowers, followed by a profusion of red shining berries, which ornament the bush during winter.

Arbutus Unedo, showing branch, flowers, and fruit.

Their flavor is insipid, but somewhat astringent. Mixed with a few raisins, they have been made by voyagers into tolerable tarts.—*A. Uva ursi*, now generally called *Arctostaphylos Uva ursi*, the RED BEARBERRY, is a small trailing evergreen shrub, common in the Highlands of Scotland and in the Hebrides, and indeed in the northern parts of Europe, Siberia, and North America. It grows in dry, heathy, and rocky places. The flowers are in small crowded terminal racemes, of a beautiful rose color. The berries are austere and mealy; they are said to form a principal part of the food of bears in northern regions. Grouse also feed on them. The dried leaves are used as an astringent and tonic medicine, and as such have a place in the pharmacopœias, being principally employed in chronic affections of the bladder; but those of *Vaccinium Vitis Idæa* are often fraudulently substituted for them.—The BLACK BEARBERRY (*A.* or *Arctostaphylos alpina*)

is also a native of the northern parts of the globe, a small trailing shrub, with black berries about the size of a sloe, relished by some, but having a peculiar taste, which to others is disagreeable. The plant is found on many of the Highland mountains in Scotland.

ARC (Lat. *arcus*, a bow) is any part of a curved line. The straight line joining the ends of an A. is its *chord*, which is always less than the A. itself. Arcs of circles are *similar* when they subtend equal angles at the centers of their respective circles; and if similar arcs belong to equal circles, the arcs themselves are *equal*. The length of an A. is readily found if the angle which it subtends at the center of the circle is known, and also the length of the whole circumference. Let the whole circumference be 100, and the angle of an A. 50°, the length of the A. is

$$360° : 50° :: 100 : \frac{100 \times 50}{360} = 14 \text{ nearly.}$$

ARC. See JOAN OF ARC.

ARCA, or ARK-SHELL, a genus of bivalve shells, and lamellobranchiate mollusca, the type of a family called *Arcadæ*, or *Arcaceæ*. In the true ark-shells, the hinge is straight. But one A. is found on the British shores; there are many species in warmer seas.

ARCACHON, a bathing-place which has sprung up recently on the south side of the Basin d'Arcachon, 35 miles S. W. of Bordeaux. The fine broad sands are admirably adapted for bathing; and the place is sheltered by sand-hills, covered with extensive fir woods; and its numerous villas amongst the firs are much frequented in winter by invalids afflicted with lung disease. Pop. (1876) 4934.

ARCA'DE (Fr.), a row of arches, supported by columns, either having an open space of greater or less width behind them, or in contact with masonry. The A. in Gothic corresponds to the colonnade in classical architecture, the difference between them being that, whereas the pillars in the colonnade support straight architraves, those in the A. support arches. The term A. is sometimes applied to a row of piers, or columns and arches, by which the aisles are divided from the nave of a church, or by which cloisters, or what are erroneously called piazzas in Britain, are enclosed; but it is more generally confined to those series of smaller arches which are employed simply for purposes of ornamentation. Arcades of the latter kind are often found surrounding the square towers of English churches. Of this we have early examples in the church of Middleton Stoney, Oxfordshire, and in the still older ones of Tewkesbury, and Christ Church in Oxford. The term is also applied, improperly, to a glass-covered street or lane, with a row of shops or stalls on each side.

ARCA'DIA, the middle and highest part of Peloponnesus, was bounded on the N. by Achaia, on the E. by Argolis, on the S. by Messenia and Laconia, and on the W. by Elis. According to Pausanias, it derived its name from Arcas, the son of Callisto. Next to Laconia, A. was the largest country in the Peloponnesus. It had an area of 1700 square miles, and was girt round by a circle of mountains, which cut off to a large extent its communication with the rest of the peninsula. Mountains also intersected it in different directions. The western part of what was anciently A., is wild, bleak and rugged, and was at one time covered with huge forests; the eastern is more fertile, the mountains not so high, and the vales more luxuriant. In these eastern valleys lay all the principal cities of A. The loftiest peak in A.—the loftiest also in the Peloponnesus—is Mount Cyllene, in the north-east (778 feet). The chief river was anciently the Alpheius (q. v.). Originally A. was named Pelasgia, after its first inhabitants, the Pelasgi. Subsequently, it was divided into several small states, which formed a confederation. Of these united states, the chief were Mantinea, Tegea, Orchomenos, Pheneus, Psophis, and Megalopolis. The inhabitants, engaged chiefly in tending cattle and in hunting among the wild highlands, remained long in a state of barbarism. After civilization had advanced, and the Arcadians had become known by their love of music and dancing, they still retained some military spirit, and were sometimes engaged as mercenary soldiers. But generally their character accorded with their simple, rural mode of life; though it seems certain that human sacrifices were offered as late as the period of the Macedonian sway. The Arcadians were not remarkable for their intelligence. In fact, an 'Arcadian youth' was a synonym for a blockhead. Pan and Diana were their favorite deities. Ancient and modern poets (the latter especially in the time when 'pastorals' were popular) have described A. as the land of peace, innocence, and patriarchal manners.

ARCA'DIUS, first emperor of the East (395—408 A.D.), was born in Spain, 383 A.D., and was the son of the Emperor Theodosius, after whose death the Roman empire was divided into East and West. A. lived in oriental state and splendor, and his dominion extended from the Adriatic Sea to the river Tigris, and from Scythia to Ethiopia; but the real rulers over this vast empire were, first, the Gaul Rufinus, and afterwards the eunuch Eutropius, who openly assumed the reins of government and the command of the army, while A. reposed in luxurious indifference. In 399, the eunuch Eutropius was deposed by another usurper, Gainas, who, in his turn, soon fell a victim to his own ambition. Afterwards, Eudoxia, the wife of the emperor, assumed the supremacy. One really great man adorned this period, the virtuous and eloquent Chrysostom, who was persecuted by Eudoxia, and through her influence exiled in 404, on account of his firm opposition to Arianism, which the empress herself favored. During the reign of A., his territories suffered by barbarian incursions, earthquakes, and famine, but nothing could disturb the indifference of the monarch. He died unlamented, 408 A.D.

A'RCÉ (anc. *Arx*), a town of South Italy, in the province of Caserta, 60 miles east-south-east from Rome. It is situated on a hill near Liris; and the summit of the hill, which is lofty and precipitous is crowned by an interesting medieval fortress called *Rocca d'Arce*. This fortress was considered impregnable till it was scaled and taken by the invading army of Charles of Anjou in 1266. Numerous inscriptions in which the name of Cicero occurs have been discovered near A.; and some ruins near the town are known as *L'aja di Cicerone*, or Cicero's Barn. Pop. of commune, 5467.

ARCESILA'US, a Greek philosopher, founder of the New Academy, was born at Pitane in Æolia, Asia Minor, 316 B.C. He studied philosophy, first under Theophrastus the Peripatetic, and afterwards under Crantor. After the death of Crantor, A. became the chief master of the Academic party, or those who held to the doctrines of Plato; but he introduced so many changes that its philosophic character was completely changed. His great rivals were the Stoics, whose opinions he attacked, but he does not appear to have attained any certainty in his own convictions. He had studied under too many masters, and discussed too many different systems, to be sure of the truth of any. He denied the Stoical doctrine of a 'convincing conception,' which he affirmed to be, from its very nature, unintelligible and contradictory. He also denied the existence of any sufficient criterion of truth, and recommended abstinence from any dogmatic judgments. In practice he maintained that we must act on grounds of probability. It is not easy to determine satisfactorily what his moral character was. A wit, a poet, and a man of frank and generous disposition, which seems to have captivated his disciples even more than his philosophy, he has yet been accused by his enemies of the grossest profligacy; and whatever extravagance there may be in such an extreme charge, it is tolerably certain that he died of a debauch in his 76th year (241 B.C.). Nevertheless, his adversary Cleanthes, the Stoic, passed this high enlogium on him: 'The morality which A. abolishes in his words, he re-establishes in his actions.'

ARCH, an arrangement of bricks, stones, or other materials over an open space, by which they are made not only to support each other by mutual pressure, but to sustain a superincumbent weight. We have the excellent authority of Sir G. Wilkinson for stating that the A. was known to, and used by, the ancient Egyptians; and that the Assyrians were acquainted with its principles is placed beyond doubt by the arched gateways so frequently represented in their bass-reliefs. The A. is generally supposed to have been unknown to the Greeks—a supposition which becomes very improbable if we hold it to be proved that it was used by nations with whose works they must have been familiar. But that the Greeks did not employ it generally in their architectural structures, is certain; and as it is not less certain that the Romans did, it is to the latter people that the nations of modern Europe are indebted for their acquaintance with its general utility. The introduction of the A. by the Romans gradually effected a complete revolution in the architectural forms which they borrowed from the Greeks. The predominance of horizontal lines gave way by degrees, till, as the Romanesque passed into the Gothic style, it was superseded by the segments of a circle, placed generally more or less in a perpendicular direction. In its earliest application by the Romans, the A. did not spring from the entablature of the columns, but was generally placed behind them, and rested upon separate imposts.

Subsequently, this arrangement was departed from, and the A. assumed the position which it has since retained above the columns; sometimes having an entablature interposed, and sometimes rising directly from the capital of the column or pier, as in the Romanesque. Before mentioning very briefly the different forms of the A., it seems natural to refer to a very simple structure, frequently met with in those early edifices in our own country which we are in the habit of designating as Saxon. It consists of two stones, their lower ends resting on rude piers, their tops leaning against each other, and thus forming two sides of a triangle, which is capable of supporting a moderate superincumbent weight. The mechanical principles on which the A. depends, though here very imperfectly employed, seem sufficiently

called into play to suggest their more extensive application; and it is not impossible that out of this rude construction the A., in its later and more elaborate forms, might have developed itself amongst ourselves without hints from foreign sources.

Of the A. itself, the following variations of form may be enumerated: The semicircle (1), the segment (2), the ellipse (3), which were the only forms employed by the ancients, and which alone were known in medieval architecture up to the time at which the pointed A. was introduced. Of these, the stilted A. (4), and the horseshoe A. (5), are modifications, in both of which the center or point from which the A. is described is above the line of the impost, but in the former of which the mouldings are continued downwards vertically; whilst in the latter they are slightly inclined inwards, or the curve is prolonged till it meets the impost. The horseshoe A. belongs peculiarly to Arabian architecture (q. v.), not only from its having originated simultaneously with the faith of the Prophet, but from its continuing to be used exclusively by his followers. Next, in point of time, though far surpassing all the others in beauty and variety, is the pointed A., the origin of which is still a subject of antiquarian controversy. The greater or less acuteness of the pointed A. depends on the position of the two center points from which its curved sides are described. Its various proportions will be better understood from the accompanying diagrams (6, 7, 8, 9) than from any verbal description

1. Semicircle.

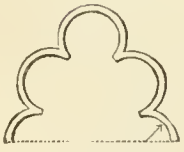
10, 11, 12 Trefoil Arches.

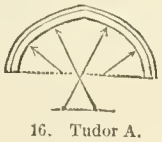
Of the foil arches (10, 11, 12, 13, 14), or arches in which the forms of a leaf are imitated, the first three are examples of the trefoil, the fourth of the cinquefoil, and the fifth of the polyfoil, the latter being met with in Arabian and Romanesque buildings. At a later period of Gothic architecture, with the decorated style, the ogee A. (15) was introduced, and the Tudor or four-cornered A. (16) appeared about the commencement of the perpendicular style. When first introduced, the proportions of this A. were bold and effective; but it was gradually depressed till the principle of the A. was lost, and its very form was again merged first in two and then in one flat stone or lintel over an opening. With the last form of the Tudor A, we thus reach almost the point of departure in the construction of the A. and complete our enumeration of its forms.



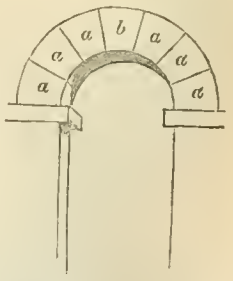
13. Cinquefoil A.

14. Polyfoil A.

15. Ogee A.



16. Tudor A.



The sides of an A. are termed *haunches* or *flanks*, and its highest part is called the *crown*. The wedge-shaped stones, bricks, or other materials of which an A. is constructed, are called *voussoirs* (*a*, *a*, *a*); the uppermost one of all (*b*) is called the *keystone;* the lowest, which is placed immediately over the impost, the *springer*, or springing-stone; the under or lower side of the voussoirs, the *intrados;* the upper side, the *extrados* or *back*. For the investigation of the mechanical principle of the arch, and of the conditions of stability, see Moseley's *Mechanical Principles of Engineering and Architecture*. See also BRIDGE, IMPOST, PIER, BUTTRESS.

ARCH, TRIUMPHAL, was a structure erected by the Romans across roads, or at the entrance of cities, in honor of victorious generals. The original triumphal arch was the Porta Triumphalis, one of the gates of Rome through which the triumphal procession entered the city. Among the earliest detached arches built at Rome was that built by Scipio Africanus (190 B.C.) on the Capitoline Hill. Under the emperors, these structures became numerous and magnificent, and were decorated with bass-reliefs and inscriptions. Three of what were properly triumphal arches still remain in Rome, those, namely, of Titus, Septimius Severus, and Constantine. Numerous similar monuments exist also in other parts of the old Roman empire, as at Rimini, Susa, Verona, Ancona, Orange (in France), Capura (in Spain).

Triumphal Arch of Constantine at Rome.

ARCHÆO'LOGY (Gr. *archaios*, ancient, and *logos*, a discourse) is the name now very generally given to the study which was formerly known as that of 'antiquities.' The term is well enough understood, although its meaning is not at all definitely fixed. In its widest sense, it includes the knowledge of the origin, language, religion, laws, institutions, literature, science, arts, manners, customs—everything, in a word, that can be learned of the ancient life and being of a people. When so used, it comprehends more or less of several branches of knowledge which are recognized as distinct or independent pursuits, such, for example, as ethnology, philology, history, chronology, biography, mythology, numismatics. In its narrower but perhaps more popular signification, A. is understood to mean the discovery, preservation, collection, arrangement, authentication, publication, description, interpretation, or elucidation of the materials from which a knowledge of the ancient condition of a country is to be attained. These materials will be found to divide themselves into three great classes: (1.) written, (2.) monumental, and (3.) traditional. 1. What may be called written A., may be again sub-divided into paiæography (q. v.), or diplomatics (q. v.)—that is, the science of ancient writings; and bibliography (q. v.), or the knowledge of printed books.

2. Monumental A. admits of almost endless sub-divisions, according to the character of the remains to be studied, which may be works of art, such as buildings, sculptures, paintings, engravings, inscriptions, coins, medals, seals, armorial-bearings, tapestry, furniture, plate, jewels, enamels, glass, porcelain, pottery; works of engineering, such as roads, canals, mines, piers, camps, forts, walls; works of unskilled labor, such as pillars of unhewn stone, caves, dikes, ditches, mounds of earth or stone; articles of dress, armor, or personal ornament; tools, weapons, implements, utensils, machines; appliances for locomotion, such as canoes, boats, ships, carriages; modes of sepulture, such as mummies, sarcophagi, urns, catacombs, graves; vestiges of man and animals, such as skulls, bones, skins. 3. Traditional A. includes as well the unwritten language and oral literature of a people, their dialect, legends, tales, proverbs, rhymes, songs, and ballads, as those sports, customs, ceremonies, rites, and superstitions now beginning to be known by the name of 'folk-lore,' and formerly called 'popular antiquities.'

The study of A. in modern Europe may be held to date from the revival of letters. It was long almost exclusively confined to

the antiquities of the Greeks and Romans. About the middle of the 16th c., Medieval A., or the antiquities of the Dark and Middle Ages, began to be cultivated. Egyptian A., or 'Egyptology,' as it is sometimes called, made comparatively little progress until the discovery of the Rosetta Stone, containing a bilingual and triliteral inscription, which enabled Young in 1819, and Champollion in 1821, to find a key to the hieroglyphics. The more recent discoveries of Botta, Layard, Rawlinson, and others, have already advanced Assyrian A. to a point beyond all expectation. Indian A. has been successfully prosecuted, especially during the last forty years, chiefly by officers of the East India Company. Something also has been done by them and others for Chinese A. Men of letters in the United States have devoted their time to the rude and scanty remains of the aboriginal inhabitants of North America. The A. of Central and South America, as it attracted attention much earlier, so its more stately and instructive monuments have much better rewarded such investigations as those of Lord Kingsborough, Messrs. Stephens and Catterwood, and others.

The study of A. has been largely promoted by the publication, at the expense of the state, in various countries, of the national chronicles, charters, and records; by societies and clubs contributing to the same end, or printing essays on questions of A; and by the establishment by the state, by associations or by individuals, of museums for the collection and classification of antiquities. In England, a society for promoting the study of antiquity was founded so early as the year 1572. The irrational jealousy of the government dissolved it in 1604. It was revived in 1707, enlarged in 1717, and incorporated by royal charter in 1751, under the name of the 'Society of Antiquaries of London.' An attempt to institute a similar society in Scotland was made about 1700, by 'some honorable and knowing gentlemen,' who resolved to continue their conferences till a complete historical account be made of the nation. But it was not until 1780 that the Society of Antiquaries of Scotland was incorporated by royal charter. The Royal Irish Academy for promoting 'the study of science, polite literature, and antiquities,' was chartered in 1786. The Society of Antiquaries of Scotland, and the Royal Irish Academy, have good museums of national antiquities. The British Museum in London (established in 1753), besides a great collection of early manuscripts and printed books, has galleries of Assyrian, Egyptian, Etruscan, Greek, Roman, British, and Medieval antiquities. One of the most remarkable collections of antiquities on the continent, is that of the Royal Society of Antiquaries of the North, at Copenhagen, arranged so as to illustrate a favorite theory of the Scandinavian archæologists—that the primitive antiquities of a country may be assigned to three successive ages or periods of stone, bronze, and iron, with as much certainty and precision as the comparative antiquity of geological strata, or periods of the world's creation, may be determined by the fossils which they are found to contain. The museums of the Louvre and the Hôtel de Cluny, in Paris, contain fine collections of Assyrian, Egyptian, Greek, and Roman antiquities, and an unrivaled collection of Medieval antiquities. The Royal Museum at Naples has gathered together the statues, paintings, vases, household utensils, and other objects recovered during the last hundred years from the ruins of Herculaneum and Pompeii. See ARCHÆOLOGY in AM. SUPP.

ARCHÆOPTERYX. See SOLENHOFEN LITHOGRAPHIC STONE.

ARCHANGEL, the chief city in the Russian department of Archangel, is situated in lat. 64° 32′ N., and long. 40° 33′ E., about 40 miles above the junction of the river Dwina with the White Sea; is the seat of an archbishop, and contains (1880) 19,540 inhabitants. Its name is taken from the monastery of St. Michael. A. is the chief commercial city for the north of Russia and Siberia, and is visited by numerous vessels—especially British—from July to September, the port being clear of ice only during that period. The houses are built chiefly of wood; and their general appearance is far from handsome. The finest edifices are the bazaar or mart, and the marine hospital. A. has an ecclesiastical college with 9 professors, schools for engineering and navigation, &c. The chief articles of traffic are fish, train-oil, skins, furs, timber, wax, iron, tallow, bristles, caviare. The town, which is the oldest seaport of the empire, and was for a long period the only one, was founded in 1584. During summer, A. has a continual market.—The government of A. has an area of 330,000 square miles, and had in 1880 a population of 307,231.

ARCHA'NGEL (from the Greek prefix *archi-* or *arch-*, denoting chief, and *angelos*, an angel), a term which occurs in the New Testament; and which, according to some, is there a title of our Saviour—but according to others, designates an angel superior in power and glory to the other angels. We read, in the Epistle of Jude, of 'Michael the A.,' and in Rev. xii. 7, of 'Michael and his angels.' In 1 Thess. iv. 16, we are told that the coming of our Lord at the last day shall be 'with the voice of the A., and with the trump of God.' We nowhere read in the Holy Scriptures of *archangels*, although the plural is popularly as much used as the singular. The notion of an angelic hierarchy certainly prevailed among the Jews, the highest place being assigned to Michael; and the same notion has extensively prevailed in the Christian church. There are passages of Scripture which seem to indicate different degrees and classes among the angelic hosts, but no clear revelation has been made upon this subject. See ANGELS.

ARCHANGEL, NEW. See SITKA.

ARCHBI'SHOP (Gr. *arch-*, and *episcopos*, overseer) is the title given to a metropolitan bishop who superintends the conduct of the suffragan bishops in his province, and also exercises episcopal authority in his own diocese. The title arose, in the 3d and 4th centuries, from the provincial synods being held once or twice a year in the chief town of the province under the presidency of the bishop of the place. Another cause of the origin of the title is said to be the custom of planting new bishoprics as Christianity spread, a slight supremacy being still retained by the original over the newly-appointed chief pastors. In the Oriental Church, the archbishops are still called 'metropolitans,' from the circumstance first mentioned. In the African Church, on the other hand, the term used was 'primus.' The great archbishoprics of the early Church were those of Jerusalem, Antioch, Ephesus, Alexandria, Constantinople, and Rome. Since the 6th c., the A. of Rome has assumed the name of Pope (papa). There is an official letter by Justinian, addressed to 'John, A. of Rome and Patriarch;' and several ecclesiastical constitutions are addressed to 'Epiphanius, A. of Constantinople and Patriarch.' The synod of Antioch, in 341, assigned to the A. the superintendence over all the bishoprics, and a precedence in rank over all the bishops of the church, who, on important matters, were bound to consult him and be guided by his advice. By degrees there arose, out of this superiority of rank, privileges which at length assumed the character of positive jurisdiction in ecclesiastical matters. Many of these rights passed to the patriarchs (q. v.) towards the end of the 4th and during the 5th centuries, and still more to the pope in the 9th. The archbishops still retained jurisdiction, in the first instance, over their suffragans in matters which were not criminal, and over those who were subject to them they acted as a court of appeal. They possessed also the right of calling together, and presiding in the provincial synods; the superintendence and power of visitation over the bishops of the metropolitan see; the power of enforcing the laws of the church; the dispensation of indulgences, and the like. The archbishops further enjoyed the honor of having the cross carried before them in their own archiepiscopate, even in the presence of the pope himself, and of wearing the *pallium*. In England, there are two archbishops, of whom the one has his seat at Canterbury, the capital of the ancient kingdom of Kent; the other at York, the capital of Northumbria. But though as ruling over a province in place of a single diocese, both have enjoyed the rank of metropolitans from the first, the A. of Canterbury has all along enjoyed, not merely precedence as the successor of Augustine and the senior A., but as possessing a pre-eminent and universal authority over the whole kingdom.

This pre-eminence is marked in the titles which they respectively assume—the A. of Canterbury being styled the Primate of all England (*metropolitanus et primus totius Angliæ*), whilst the A. of York is simply called Primate of England (*primus et metropolitanus Angeliæ*). It is also indicated by the places which they occupy in processions—the A. of Canterbury, who has precedence of all the nobility, not only preceding the A. of York, but the Lord Chancellor being interposed between them. Previous to the creation of an archbishopric in Ireland, the authority of the A. of Canterbury extended to that island. The amount of control which belongs to an A. over the bishops of his province is not very accurately defined; but if any bishop introduces irregularities into his diocese, or is guilty of immorality, the A. may call him to account, and even deprive him. In 1822, the A. of Armagh, who is primate of all Ireland, deposed the Bishop of Clogher on the latter ground. To the A. of Canterbury belongs the honor of placing the crown on the sovereign's head at his coronation; and the A. of York claims the like privilege in the case of the Queen-consort, whose perpetual chaplain he is. The province of the A. of York consists of the six northern counties, with Cheshire and Nottinghamshire. The rest of England and Wales form the province of the A. of Canterbury. The dioceses of the two archbishops—that is to say, the districts in which they exercise ordinary episcopal functions—were remodelled by 6 and 7 Will. IV. c. 77. The diocese of Canterbury comprises Kent, except the city and deanery of Rochester, and some parishes transferred by this act; a number of parishes in Sussex called 'peculiars;' with small districts in other dioceses, particularly London. The diocese of the A. of York embraces the county of York, except that portion of it now included in the dioceses of Ripon and Manchester; the whole county of Nottingham; and some other detached districts.

In Ireland, there are two Protestant and four Roman Catholic archbishops. Of the former, the A. of Armagh is primate of all Ireland; the A. of Dublin being Primate of Ireland. They for-

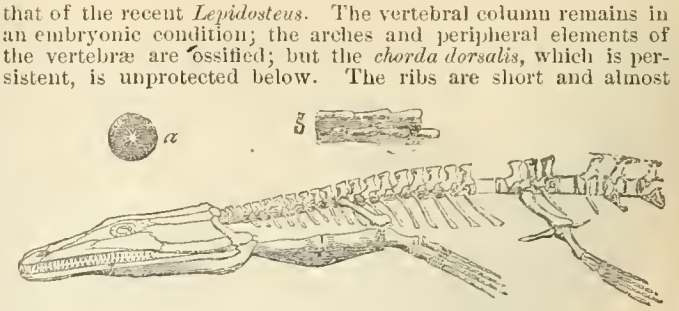
merly sat alternately in the House of Lords; the three bishops who, along with them, represented the Church of Ireland, being chosen by rotation. The election of an A. does not differ from that of a bishop (see BISHOP) but when he is invested with his office, he is said to be 'enthroned,' whereas a bishop is 'consecrated.' He also writes himself, 'by Divine Providence;' a bishop being, 'by Divine permission;' and has the title of 'Grace,' and 'Most Reverend Father in God,' whilst a bishop is styled 'Lord,' and 'Right Reverend Father in God.' The A. is entitled to present to all ecclesiastical livings in the disposal of diocesan bishops, if not filled up within six months; and every bishop, whether created or translated, was formerly bound to make a legal conveyance to the A. of the next avoidance of one such dignity or benefice belonging to his see as the A. shall choose.

ARCHDEA'CON (Gr. *arch-*, and *diaconos*, servant). An ecclesiastical dignitary whose jurisdiction is immediately subordinate to that of the bishop. The A. originally was simply the chief of the deacons, who were the attendants and assistants of the bishop in church affairs. His duties consisted in attending the bishop at the altar and at ordinations, assisting him in managing the revenues of the church, and directing the deacons in their duties. From being thus mere assistants, archdeacons in the 5th c. began to share the bishop's powers, and step by step attained to the authority which they now enjoy, which from the 9th c. became in many respects distinct from that of the bishop. Several synods protested against the innovation, but it was continued in the 11th and 12th centuries, when the archdeacons were recognized as the most influential of prelates. In the 13th c., their powers were limited by the establishment of episcopal courts. Their dignity and influence is now very much reduced in the Catholic Church. There were formerly sixty archdeaconries in England, but their number has been considerably increased since the passing of the act for carrying into effect the report of the Ecclesiastical Commissions (6 and 7 Will. IV. c. 77); and it is probable that under the provisions of that act they may be still further increased. No person can be appointed an A. till he has been six years complete in priest's orders (3 and 4 Vict. c. 113, s. 27). The duty of parochial visitation has long been regarded as belonging specially to the archidiaconal office, and it was by its exercise mainly that the archdeacons attained to the dignity of ordinary instead of delegated jurisdiction. Even in performing this function, however, and in holding general synods or visitations, ordering repairs of churches, and the like, the A. is properly to be regarded as being what the canon law called him, 'the bishop's eye.' The judge of the A.'s court, when he does not preside, is called 'the official.' There is an appeal to the Court of the Bishop, or in the case of an A. of an archbishopric, to the Court of Arches. See DEACON, DEAN, PRIEST. See also Cripps's *Law Relating to the Church and Clergy*. Edinburgh, 1857.

ARCHDU'KE. A. and Archduchess are titles now taken by all the sons and daughters of the Emperor of Austria, and by their descendants through the male line. The title of A. was gradually assumed by the dukes of Austria, as a mark of precedence over the other dukes of the empire. Duke Rudolph IV. of Austria, in 1359, called himself Palatinus Archidux, but he was not so styled by the emperor. His brothers, Albert and Leopold, did not assume the title after his death, though they had occasionally done so in his lifetime. The third son of Leopold, however, Ernest-the-Iron, revived it. Still he was addressed by the emperor simply as duke. At last the title was formally conferred on them by the Emperor Frederick III. in 1453, who himself, as duke, was the first recipient of the imperial gift. Still the usage was not uniform, for he afterwards speaks of himself as duke. The privilege was extended to the Tyrolian branch of the Austrian House in the person of Sigismund. The value of the dignity thus assumed was a cause of contention with Bavaria in 1589. The Austrian view was, that to duke it held the same relation that archbishop does to bishop. The dukes of Austria claimed to have always had precedence over the other ducal houses, and regarded the title as a mere indication of what had been universally acknowledged. Bavaria, on the other hand, relied on the greater antiquity of its dukedom. The contest was decided by the Emperor Rudolph II. in favor of Austria, the precedence of which has not since been called in question. Other dukedoms claimed the privilege of being so called, but it was invariably denied by the emperor.

ARCHEGOSAU'RUS, a remarkable fossil saurian reptile, so named by Goldfuss (*archegos*, leader; and *sauros*, lizard), as constituting the real beginning of reptilian life, which had previously been considered as not extending below the Permian series of rocks.

From the engraving, it will be seen that the head of the A. is protected by a firm dermal skeleton, composed of numerous plates, while the internal primary cartilage seems to have continued unossified. The skull is flattened and triangular, with rounded angles, the front one being somewhat lengthened. The teeth are simple cones, having a labyrinthic structure similar to that of the recent *Lepidosteus*. The vertebral column remains in an embryonic condition; the arches and peripheral elements of the vertebræ are ossified; but the *chorda dorsalis*, which is persistent, is unprotected below. The ribs are short and almost



Archegosaurus:
a, section of a tooth; *b*, scales.

straight, round and slender in the middle, expanded and flattened at the ends. The two pairs of limbs are nearly equal in size, and in structure very much resemble those of the *Proteus*. They have each four long, slender digits, which obviously supported a longish, narrow-pointed paddle, adapted for swimming. Externally, the body was protected by a covering of oblong quadrangular scales which have been preserved in some specimens.

Four species have been described.

The history of the A. is shortly this: Its remains found in the Bavarian coal-measures, had been described as those of a fish under the name of Pygopterus Lucius (Agassiz). In 1844, H. von Meyer first described it under the name of *Apateon pedestris*. This specimen was found in the coal-measures of Münster-Appel, in Rhenish Bavaria, and was supposed by Meyer to be related to the salamanders, and yet not without considerable doubt; for he says: 'its head might be that of a fish, as well as that of a lizard, or of a batrachian.' In 1847, Goldfuss figured and described three distinct species discovered in large concretionary nodules of clay-ironstone, from the coal-field of Saarbrück, giving to them the generic name of A. He considered them to be a transition state between the fish-like batrachia and the lizards and crocodiles. Professor Owen has subsequently described this fossil; he makes it a remarkable connecting link between the reptile and the fish, and on these grounds: It is related to the salamandroid-ganoid fishes by the conformity of pattern in the plates of the external cranial skeleton, and by the persistence of the *chorda dorsalis*, as in the sturgeon, while it is allied to the reptiles by the persistence of the *chorda dorsalis*, and the branchial arches, and by the absence of the occipital condyle, or condyles, as in *Lepidosiren*, and by the presence of labyrinthic teeth, as in *Labyrinthodon*, which, however, also ally it to the ganoid *Lepidosteus*. There is thus in the A. a blending together of the characteristics of reptile and fish in one animal. It occupies a position between, and equally related to, the salamandroid-ganoid fishes on the one hand, and the labyrinthodont reptiles on the other, while the latter conduct us through the *Lepidosiren* to the perennibranchiate batrachia.

ARCHELA'US, one of the Heraclidæ, who, when driven by his brothers from his native land, fled to Macedon, where he became the founder of a powerful family, of which Alexander the Great was said to be a descendant.—ARCHELAUS, natural son of the Macedonian king, Perdiccas II., came to the throne (after he had murdered the rightful heir) in 413 B.C. His reign was far better than its commencement, as he introduced several salutary measures, and was a generous patron of art and literature. Euripides and Zeuxis frequented his court; and the palace of the monarch was splendidly adorned by the paintings of the latter. It is said that Socrates refused an invitation to proceed thither, having no great respect for the character of A., which was stained with odious vices. He is believed to have been murdered by Craterus, one of his favorites; but the story of his death is told differently. —A., a general under Mithridates the Great, was sent into Greece with a large fleet and an army of 120,000 men to oppose the Romans in 87 B.C. Sulla was sent against him, and besieged him in Piræus, whence A. moved to Bœotia, and here collected all his forces. A battle took place at Chæroneia, when victory declared for the Romans. A. now retreated to Chalcis, where he waited until Mithridates had despatched another army of 80,000 men into Greece. The second fight took place at Orchomenos, in Bœotia, and, after two days' contest, the whole host led by A. was totally routed by Sulla. A., after hiding three days in a morass, escaped to Chalcis. After a treaty of peace had been effected between Sulla and Mithridates, A. fell under the displeasure of his monarch, being unjustly suspected of treason, and, fearing for his life, as also perhaps disgusted at the return he had received for his many services, he went over to the Romans at the outbreak of the second war, in 81 B.C. After this time, he appears no more in history.—A., son of the former, married Berenice, daughter of King Ptolemæus Auletes (56 B.C.), and ruled over Egypt for the short space

of six months during the banishment of Ptolemæus. The usurper lost his life in a battle against Aulus Gabinius, proconsul of Syria. His grandson, also named A., obtained from Marcus Antonius the province of Cappadocia, and retained it during the reign of Augustus. Tiberius accused him of political innovations, and condemned him to death; but, as he was old and fatuous, his life was spared. He died soon after his trial, at Rome, in 17 A.D.—A., son of Herod, the tyrant of Judea, succeeded his father in 1 A.D., and maintained his position against an insurrection raised by the Pharisees. His heirship to the throne being disputed by his brother Antipas, A. went to Rome, where his authority was confirmed by Augustus, who made him Ethnarch of Judæa, Samaria, and Idumæa. After a reign of nine years, he was deposed by Augustus, on account of his cruel tyranny, and banished to Vienna, in Gaul, where he died. His territories were added to the Roman province of Syria.

ARCHENHOLZ, JOHANN WILHELM, BARON VON, a German author, born Sept. 3, 1745, died Feb. 28, 1812. After service in the army, he gained his discharge at the close of the Seven Years' War, and passed several years in travel, visiting almost all the principal cities of Europe, and supporting himself by authorship, and, as it was generally reported, also by gambling. He wrote a *History of the Seven Years' War* (2 vols., Berlin, 1793), which, when compared with the generally dry style of his German contemporaries, deserves praise on account of its narrative interest. He also wrote *England and Italy* (2d edition, Leip. 1787), *Annals of British History* (1789—1798), and biographies of Queen Elizabeth of England, and Gustavus Vasa of Sweden.

A'RCHER FISH, a name given to certain small East Indian fishes of the Acanthopterygious family of *Squamipennes* or *Chætodontidæ*, which have the faculty of projecting drops of water with sure aim at insects, and thereby causing them to fall into the water, where they are instantly seized as prey. *Toxotes jaculator*, one of these species, is a fish about six or seven inches in length, a native of Java and other parts of the Indian Archipelago, and is that to which the name A. F. has been more strictly appropriated. It can project a drop of water to the height of four or five feet. It is the only known recent species of its genus, but there is a fossil one. *Chelmon rostratus*, also a Javanese fish, possesses the same power, and the Chinese in Java keep it in jars for their amusement, causing it to practise its art by placing insects within its range.

A'RCHERS AND A'RCHERY. Archers are soldiers whose weapons are the bow and arrow. Among the ancients eminent in this mode of warfare, were the Thracians, Cretans, Parthians, Numidians; among the moderns, the Arabians, Germans, and Saracens. The Emperor Frederick II. employed Saracenic archers in his Lombard campaign; and to them is ascribed the victory at Cortenuova in 1237. The archers belonged to the light troops, and their province was to open the battle. The Emperor Leo lauded the dexterity of the Arabian archers. Later the bow came to be employed in England, where the archers wore light armor, a short sword, and a quiver with twenty or more arrows. At first, these archers fought in small groups; in later years, in large masses. At the battle of Cressy they formed in divisions of 4000 men, 200 in line and 400 deep. The archers decided the fate of the day in several battles—such as Cressy and Potiers (1356), Agincourt (1415), Crévaut (1423), Verneuil (1424), and Rovernay (1429). The French archers never equaled the English, in spite of the pains Charles VI. and Charles VII. took with them. The latter organized in 1448 the *Franc-archers*, to which every parish had to contribute one man; but this was attended with so little success that the King took Scottish archers into his pay, to make head against the English. The French archers wore a coat of buffalo-hide lined with linen, and were accompanied by shield-bearers. Thus 2000 bowmen with their shield-bearers fought under the Count de Foix at the siege of Bayonne in 1451. The archers belonged to the élite of the troops, and received higher pay than the rest. At one period, the Arbalest or cross-bow was more in favor than the long-bow. See ARBALEST. Long after the discovery of gunpowder, we find the bow and arrow still used; as at the siege of Capua in 1500; and the siege of Peineburg in 1502. In 1572, Queen Elizabeth promised to place at the disposal of Charles IX. 6000 men, of whom half were archers. The English archers are the subject of frequent mention by our old writers. Chaucer, in his *Canterbury Tales*, speaks of the archer.

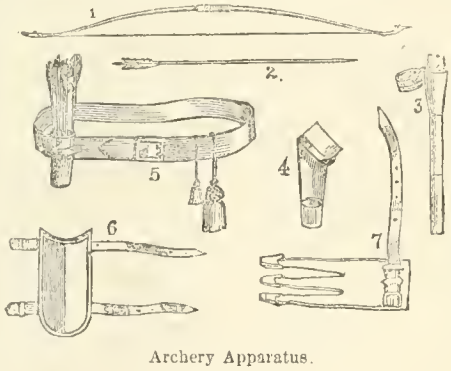
> 'Cladde in cote and hode of grene,
> A sheafe of peacock arwes brighte and kene,
> Under his belt he bare ful thriftilie.
> Wel coude he dresse his takel yewmanlie,
> His arwes drouped not with fetheres lowe,
> And in his hand he bare a mighty bowe.'

In a Treatise on Martial Discipline, by Ralph Smithe, written in the time of Queen Elizabeth, we have a picture of the English archer two centuries after Chaucer's time: 'Captens and officers should be skilful of that most noble weapon the long-bow; and to see that their soldiers, according to their draught and strength, have good bowes, well nocked, well strynged, everie strynge whippe in their nocke, and in the middes rubbed with wax braser, and shuting-glove, some spare strynges trymed as aforesaid; every man one shefe of arrows, with a case of leather defensible against rayne, and in the same four-and-twentie arrowes, whereof eight of them should be lighter than the residue, to gall or astoyne the enemye with the hailshot of light arrowes before they shall come within the danger of their harquebus shot. Let every man have a brigandine or a little coat of plate, a skull or hufkyn, a maule of leade of five foote in lengthe, and a pike, and the same hanging by his girdle with a hook and dagger.'

Among the Asiatic Turks, the Persians, the Tartars, and other nations of the east, as well as the American Indians, the bow and arrow are still used as weapons of war. In Europe, they are nearly abandoned for military purposes. The chief differences between the two kinds of weapon employed by the archers of the middle ages are noticed under ARBALEST; BOW AND ARROW.

Although archers are still included among the fighting-men of barbarous and semi-barbarous nations; in England, archery is now nothing more than a pastime, encouraged by archery clubs or societies. In this sense, however, archery is experiencing a revival, being healthful as an out-door exercise, even if no further useful. During the reign of Charles II., archery was much patronized by the court, Tothill Fields being the chief scene of exercise. After his reign, archery fell into desuetude for about a century. In 1776, a Mr. Aston revived archery in the neighborhood of London; and very shortly there were several toxophilite or archery societies formed. The system survived till 1793, when another period of inactivity supervened, lasting till 1844. In this last-named year, archery revived in Yorkshire, and has since gone on extending every year. A recommendation to the sport is that the ladies can take part in it—one of the few open-air pastimes of which this can be said. In the modern exercise of archery, there are several varieties of contests between the antagonistic parties; but the usual variety is target-shooting. In archery-matches, a number of prizes are generally awarded, the principal being for the greatest number of arrows shot in any part of the target, and for the nearest approach to the exact center. The target has a gold spot in the center, a red ring around this, then a blue ring, then a black, and outside of all a white ring bordered with green.

The merit of the shooting consists in a near approach to the exact center or 'gold.' Two targets are generally used in a match, on opposite sides of the field, each by one party. The apparatus mostly used at these archery meetings is represented in the annexed cut. 1 is a bow, varying in weight according to the strength of the person who is to use it; 2 is the arrow; 3 is the quiver, a tin case for holding arrows not immediately in use; 4 and 5 are the pouch and belt for holding the arrows actually in use. The tassel of the belt serves to clean the arrows when dusty. 6 is the brace, buckled round the left arm, to protect it from being hurt by the string when shooting; 7 is the shooting glove, formed to protect the three fingers used in drawing the string. Besides these articles and the target, archers are sometimes provided with a large case called an 'ascham,' fitted up with the necessary drawers and compartments for the reception of the bow, arrows, string, and other necessary accoutrements.



Archery Apparatus.

In archery competition, the total number and value of each person's hits are registered on a scoring-card. The shots are usually punctured on a card with a pin, as being preferable to pencil or ink marks; and the mode of ascertaining the value of the hits, which is increased in proportion as they reach the center, will be seen by the following example:

FORM OF THE SCORING-CARD.

Names.	Gold.	Red.	Blue.	Black.	White.	Total.	Value.
A	. .	....	.....	.....	.....	35	119
			.	.....	.....		
					...		
B	.	..	.....	.....	.....	26	80
			...	.	....		

It appears by the card that A has two in the gold, four in the red, six in the inner white, ten in the black, and thirteen in the

outer white, making a total of thirty-five. The real value of these is ascertained by multiplying the hits in the gold by nine; in the red, by seven; in the blue, by five; in the black, by three; and by leaving without alteration the number in the white or outer. By this process it will appear that A's numbers, according to the *value* of each circle, amount to 119, and B's to 90—hence A is the winner by 29. But A's *total* might have been less than B's, and still he might have been the winner, providing the shots had lain more towards the gold than B's.

As an instance of the skill which long and careful practice may insure, Mr. Horace A. Ford, who has written an excellent work on Archery, on one occasion, out of 144 shots, made 143 hits—765 score; on another, 144 shots, 137 hits—809 score; and on another, 75 shots, 75 hits—555 score.

A'RCHIL, or O'RCHIL, is a coloring substance obtained from various species of lichens. The A. is not originally present in the lichens, but is developed during a process of putrefaction and fermentation. The lichens, collected from rocks near the sea, are cleaned, ground into a powder with water, placed in tanks, and ammoniacal liquids—such as purified gas liquor or stale urine—added, when by the combined influence of the ammonia, air, water, and the constituents of the lichens, a violet-colored matter is generated, which appears for a time to dissolve in the water, but finally falls to the bottom of the vat in the condition of a moist powder or paste. The latter is then mixed with some substance like chalk or stucco, to give it consistence. The lichens which yield the best A. in largest quantity, are *Roccella tinctoria* and *fuciformis*. The former is called the *Archil* plant, and is obtained in large amount from the Canaries and Cape de Verd Islands, and the Levant. Another lichen *Lecanora tartarea*, collected from rocks in Sweden, is largely imported into Britain. It is sometimes called cudbear (q. v.), or cudbear lichen, and sometimes white Swedish moss. A. is soluble in water and in alcohol, to either of which it imparts a violet color, with a good deal of a crimson hue. It is much employed in the dyeing of silks, where a beautiful lilac color is required; but though a brilliant rich hue is imparted to the silken fabric, the color is not a permanent one, being easily acted upon by the rays of the sun. Hence the A. is seldom used by itself, and the cloth is first dyed lilac by another coloring matter, and is then passed through an A. dye, which imparts a brilliant lilac hue to the cloth. A. is seldom employed to dye cotton cloth, but it is often used, along with indigo, in the dyeing of woollen cloth; and besides enabling the indigo color to go much further; it imparts its peculiar rich tint to the blue or black cloth or yarn immersed in it; the color, however, so obtained is not so permanent as where the A. is left out. Cudbear (q. v.) and Litmus (q. v.) are analogous to A., and are obtained from the same lichens.

The lichen distinguished by the name of the A. plant or lichen, *Roccella tinctoria*, grows very sparingly on the southern coasts of England, but abundantly on the shores of the Mediterranean and of the neighboring parts of the Atlantic, where it often covers rocks near the sea, so as to form what has been likened to a sort of turf upon them. The Spanish name is *Orciglia*, from which the French *Orseille*, the English A. or Orchil, and even the botanical name *Roccella*, are derived. It is of a substance between cartilaginous and leathery, roundish, pretty erect, branching in a dichotomous manner, of a grayish brown color, with powdery warts (*soredia*); the *apothecia* (q. v.) orbicular, flat, horny, almost black, with a scarcely prominent border. That from the Canary Isles is generally regarded as the best. It seldom exceeds the thickness of a pin, and about an inch and a half in length. A less branched and more slender, prostrate, or pendulous variety (*Roccella hypomecha* of Bory de St. Vincent) is common at the Cape of Good Hope and in the island of Mauritius, and appears in commerce along with the other, but is of very inferior quality. A variety remarkable for its large size, or perhaps a distinct species (*R. flaccida*), is brought from Lima and other parts of the west coast of South America; it is sometimes as thick as a goose-quill, and 6 or 8 inches long, and is of excellent quality. All these, and *Roccella fuciformis*, very generally receive in commerce, and from A.-makers, the name of Orchella weed, the different kinds being distinguished according to the countries from which they are imported. They are also popularly called Dyer's Moss.—*R. fuciformis* now yields perhaps more of the A. or Orchella weed of commerce than *R. tinctoria*. It differs from *R. tinctoria* chiefly in being not rounded, but flat, and in having the *apothecia* very distinctly bordered. It grows in similar situations, and is also a native of Britain, but abundant only in warmer climates, as on the coasts of Africa, Madagascar, &c. That from Angola is reckoned of the very best quality.

Among the lichens from which A. is manufactured is the *Parelle d'Auvergne* or *Orseille de terre* (Ground A.) of the French *Variolaria orcina* or *corallina*, which is gathered for this purpose in mountainous districts of the south of France and other parts of the south of Europe, and is also an article of export (with other similar lichens) from Sweden to Holland. But the greater facility with which A. of the finest quality can be procured from the species of *Roccella*, and the increasing abundance of the supply from different quarters, particularly from Angola, tend to diminish the demand for other lichens.

ARCHI'LOCHUS of Paros, in Lydia, flourished about 714—676 B.C., and is regarded as the first of the Greek lyric poets, although the origin of the elegy is claimed for Callinus, a writer whose age seems to have slightly preceded that of A. Glimpses of his life, especially of the calamities which befell him, were frequently given in his writings. His father's name was Telesicles, his mother was a slave called *Enipo*. At an early age, becoming entangled in political contests, he abandoned his native town, and led a colony of the citizens to Thasos. While here, as he informs us in some extant verses, he lost his shield in a battle against the Thracians, yet not through cowardice. Subsequently he was banished from Sparta, to which he had gone, some say because he had vindicated his conduct in running away from the fight, others, because of the licentiousness of his verses. He is said to have gained the laurel-wreath at the Olympic games by an ode in honor of Hercules, but this is doubtful. Having returned to Paros, he took part in the war which broke out betwixt it and Naxos, in the course of which he lost his life, either in battle or by assassination. The Delphian oracle pronounced a curse upon his slayer. Variety, novelty, and satirical bitterness characterized his lyric poems; so much so, that 'Archilochian bitterness,' and 'Parian verse,' became by-words in ancient times. He scourged his enemies in the most merciless fashion, and always displayed the most malicious skill in selecting for his sarcasm the points on which they were the most sensitive. It is said that Lycambes, who had promised his daughter Neobule in marriage to A., having failed to fulfil the promise, was so severely satirized by the poet, that to escape ridicule, both father and daughter hanged themselves. Among the ancients A. was ranked with Homer. They dedicated the statues of both on the same day, and placed the head of A. beside that of Homer on the same bust. It is therefore supposed, and with high probability, that there must have been far more in A. than mere vehemence of satire. Even Plato, who was not likely to err on the side of admiration in such a case, calls him 'the very wise;' and Gorgias, the rhetorician, is reported to have said, when Plato sent forth his dialogues against the Sophists, 'Athens has given birth to a new A.' There must have been strong sense, and a keen perception of truth in the man, to have won so universal and permanent a reputation. Still the line of Horace—who was a vigorous imitator of him in many respects—proves that 'rage' was considered 'the special faculty' of A.

'*Archilochum proprio* rabies *armavit iambo.*'
Ars Poetica, line 79.
'Rage hath armed Archilochus with his own iambus.'

The word *iambus* was in use before the time of A., and was employed to denote a species of rude raillery, such as flashed out spontaneously under the inspiring excitement of the Bacchic and other festivals. A. was, however, the first to reduce these irregular and capricious effusions to fixed rules. See Iambics. The semi-pentameter, of which he made abundant use, was called after him *Archilochian verse*.

The fragments extant of his poetry have been edited by Bergk in his *Poetæ Lyrici Græcorum* (Leipsic, 1843).

ARCHIMA'NDRITE (Gr. *archi-*, chief, and *mandra*, a fold or a convent), the title of the highest order of superiors of convents in the Greek Church (see Abbot). The Russian bishops are chosen from among the archimandrites.

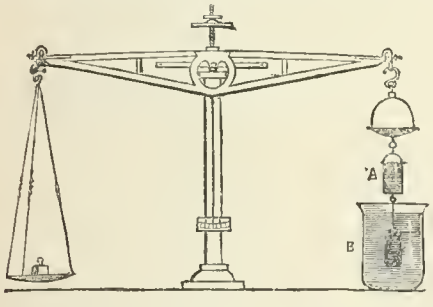
ARCHIME'DES, the most celebrated of ancient mathematicians, was born at Syracuse about 287 B.C. He is said to have been a kinsman of King Hiero, though he does not seem to have held any public office, but devoted himself entirely to science. In regard to mathematics, we cannot estimate fully the merits of A. without a more exact knowledge of the state of the science as he found it; we know, however, that he enriched it with discoveries of the highest importance, on which modern mathematicians have founded their methods of measuring curved surfaces and solids. Euclid only considers a few curved figures in relation to one another, but without comparing them with rectilineal surfaces and solids. The theorems necessary to this transition are laid down by A. in his treatises 'on the Sphere and Cylinder,' 'on Spheroids and Conoids,' and 'on the Measurement of the Circle.' His demonstration that the area of a segment of a parabola is two-thirds of the enclosing parallelogram, is the first real example of the quadrature (q. v.) of a curvilinear space. In his treatise on spirals, he rises to yet higher investigations, which, however, are not very easily understood even by masters of the subject.

A. is the only one of the ancients that contributed anything satisfactory on the theory of mechanics and on hydrostatics. He first established the truth, that a body plunged in a fluid loses as much of its weight as is equal to the weight of an equal volume of the fluid. (See the following article.) It was by this law that he

determined how much alloy the goldsmith, whom Hiero had commissioned to make a crown of pure gold, had fraudulently mixed with the metal. The solution of the problem had suggested itself to him as he was entering the bath, and he is reported to have been so overjoyed as to hasten home without waiting to dress, exclaiming: 'I have found it! I have found it!' (*Eureka! Eureka!*) Practical mechanism seems to have been an equally new science in the days of A.; for his boast, that if he had a fulcrum or standpoint, he could move the world, betrays the enthusiasm with which the extraordinary effects of his newly invented machines inspired him. Among the numerous inventions ascribed to A., is that of the endless screw, and the *cochlea* or water-screw (see ARCHIMEDES' SCREW), in which the water is made in a manner to ascend by its own gravity. During the siege of Syracuse by the Romans, he exerted all his ingenuity in the defence of the city. Polybius, Livy, and Plutarch speak with astonishment of the machines with which he opposed the attacks of the enemy.

But while giving detailed accounts of his other contrivances, they say nothing of his having set fire to the ships by means of mirrors, a story which is not very probable in itself, and rests on later narratives. When the Romans took the city by surprise (212 B.C.), A., according to the tradition, was sitting in the public square lost in thought, with all sorts of geometrical figures before him drawn in the sand. As a Roman soldier rushed upon him, he called out to him not to spoil the circle! But the rude warrior cut him down. According to his own direction, a cylinder enclosing a sphere was engraved upon his tombstone, in commemoration of his discovery of the relation between these solids—a discovery on which he set particular value. When Cicero was in Sicily as questor, he discovered the tomb hid among briers. His collected extant works were edited by Torelli (Oxf. 1792). There is a French translation with notes by F. Peyrard (Paris, 1808, 2 vols.), and one in German by Nizze (Strals. 1824). The *Arenarius* was translated into English by G. Anderson (Lond. 1784). The object of the treatise is to prove that it is possible to assign a number greater than that of the grains of sand that would fill the sphere of the fixed stars, the diameter of which A. assumes at a certain number of stadia. The difficulty lay in expressing such a vast number by means of the clumsy notation of Greek arithmetic, and the device by which the difficulty is eluded is considered as affording a striking instance of A.'s genius.

ARCHIMEDES, the PRINCIPLE OF, is one of the most important in the science of Hydrostatics, and is so called because the discovery of it is generally ascribed to the Syracusan philosopher. It may be thus stated: A body when immersed in a fluid loses exactly as much of its weight as is equal to the weight of the fluid it displaces; or: A fluid sustains as much of the weight of a body immersed in it as is equal to the weight of the fluid displaced by it. It is proved experimentally in the following way. A delicate balance is so arranged that two brass cylinders, A and B, may be suspended from one of the scale-pans, the one under the other.



The lower cylinder, B, is solid, or closed all round, and fits accurately into the upper cylinder, A, which is hollow. When the two cylinders are placed under the one scale, pan-weights are placed upon the other until perfect equilibrium is obtained. The cylinder B is now immersed in water, and in consequence of the buoyant tendency of the water exerted upon it, the equilibrium is destroyed; but it may be completely restored by filling the hollow cylinder, A, with water. The amount of weight which B has lost by being placed in the water, is thus found to be exactly the same as the weight of a quantity of water equal to its own bulk, or which is the same thing, to the quantity of water displaced by it. When bodies lighter than water are wholly immersed in it, they displace an amount of water of greater weight than their own, so that if left free to adjust themselves, they swim on the surface, only as much of their bulk being submerged as will displace a quantity of water weighing the same as themselves. Accordingly, while bodies heavier than water displace, when put into it, their own bulk, bodies lighter than water displace, when allowed to float on the surface, their own weight of the fluid. Bodies of the same weight as water, according to the principle of Archimedes, have no tendency to rise or sink in it, for the water displaced by them weighs precisely they same as they do. The pretty scientific toy called the Cartesian Diver is intended to illustrate this. Although the principle of Archimedes is generally established with reference to water, its application extends equally to bodies immersed in air or in any other fluid.

ARCHIME'DES' SCREW (called also the *spiral pump*), a machine for raising water, said to have been invented by Archimedes, during his stay in Egypt, for draining and irrigating the land. Fig. 1 represents it in its simplest form. This consists of a flexible tube bent spirally round a solid cylinder, the ends of which are furnished with pivots, so as to admit of the whole turning round its axis. The machine is placed in an inclined position, so that the lower mouth of the tube may dip below the surface of the water to be raised. In the position represented in the figure, the lowest bend (*a*) of the tube will be filled with water, and if now the handle be made to turn in the direction of the hands of a watch, the mouth of the spiral tube will be raised above the surface; and the water enclosed in the tube, having no means of escape, will flow within it until, after one revolution, it will occupy the second bend, *b*. The first bend (*a*) has meanwhile received a second charge, which, after a second revolution, flows up into the second bend (*b*), and takes the place of the first charge, which has now moved up to the third bend, *c*.

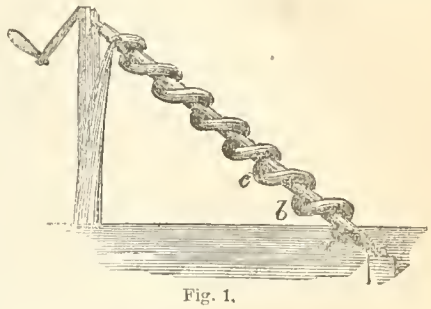


Fig. 1.

When, therefore, as many revolutions of the cylinder have been made as there are turns in the spiral tube, each of the lower bends will be filled with water; and in the course of another revolution, there being no higher bend for the water of the first charge to occupy, it will flow out of the tube by its upper mouth. At each succeeding revolution, the lowest bend will be charged, and the highest discharged. It will be seen from the figure that there is room to dispose a second tube side by side with the first, round the cylinder, in which case the screw would be called double-threaded. In the ordinary construction of these machines, the cylinder itself is hollowed out into a double or triple threaded screw, and enclosed in a water-tight case, which turns round with it, the space between the threads supplying the place of such tubes as are seen in Fig. 1. Fig. 2 represents a double-threaded A. S. of this description, with the case removed in front. It is sometimes found convenient to fix the exterior envelope, and to make the screw work within it, the outer edge of the latter being as close as possible to the former without actual contact. This modification of the A. S. receives the name of water-screw, and frequently of Dutch screw, from its being extensively used in Holland for draining low grounds.

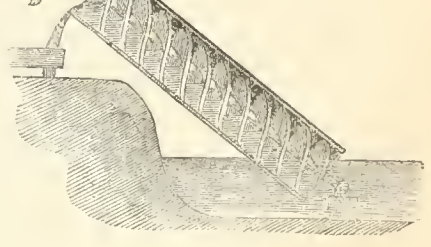

Fig. 2.

ARCHIPE'LAGO, a term (of doubtful etymology) applied originally to that gulf of the Mediterranean which separates Greece from Asia; but now extended to any sea, like it, thickly interspersed with islands, or rather to the group of islands themselves. The islands in the Greek Archipelago or Ægean Sea consist of two groups, called Cyclades and Sporades; the first from their being massed after the manner of a circle, the second from their being scattered in something of a line. The former lie to the east of Southern Greece, while the latter skirt the west of Asia Minor.

Of the Cyclades the principal islands are: Lyra, Kythnos, Thera, Tenos, Andros, Naxos, Melos, and many more of inferior size. They all belong to *Greece*, and will more conveniently be considered in connection with it. The chief islands of the Sporades are: Scarpanto, Rhodes, Cos, Patmos, Nicaria, Samos, Scio, Metelin, Lemnos, Imbros, Samothraki, Thasos, and many more of inferior size. These all belong to Turkey, and constitute a separate vilayet of the empire. Of both groups, the more considerable islands will be noticed, under the alphabetical arrangement, in their respective places.

The other Archipelagoes, loosely so called, will receive separate notice each in its proper place.

A remarkable circumstance may be mentioned in connection

with Archipelagoes. The islands of the globe rarely stand alone. With very few exceptions they may all be classified into clusters. In most clusters, again, there is generally more or less of similitude between the different members of each—similitude sometimes of one kind, and sometimes of another. Perhaps the similitude that is most obvious even on the face of an ordinary map, is that, really like the links of a chain, the members of a cluster have their lengths, as distinguished from their breadths, in one and the same direction. In the West Indies, for instance, look at the Bahamas, and look also at the Antilles, Greater and Lesser. In the East Indies, again, the same thing is seen in carrying the eye from the north end of the Philippines to the north end of Sumatra, or even of the Andamans. Lastly, on the opposite coasts of the Upper Pacific, observe the American side upwards from the south end of Vancouver's Island to Mount St. Elias, and the Asiatic side downwards from the upper extremity of Kamtchatka—which is all but an island—through the Kuriles, to the lower extremity of Japan.

ARCHITE'CTURAL PAINTING has for its subjects the exteriors or interiors of remarkable buildings; churches, castles, streets in cities, &c. It is mentioned by Vitruvius, but is comparatively a modern art. Benozzo Gozzoli, Ghirlandajo, and the Venetian school, cultivated this department of art in the middle ages; and Pinturicchio, by order of Pope Innocent VIII., painted a series of views of cities in the style of the Flemish school, which, under the brothers Van Eyck, had distinguished itself by careful treatment of architectural backgrounds, &c. For a long time, A. P. was regarded only as accessory to other styles of art; but, at the close of the 16th c., P. Neefs, in his views of the interior of Gothic churches, gave to this branch of the fine arts an independent form; and Steenwyck the younger, in the following century, extended its application in his views of the interiors of prisons, of which his picture of 'Peter Liberated from Prison' is an example. The art was still further extended and cultivated by Van der Heijden, Blick, Van Deelen, E. de Ville, Johann Ghering, and others who painted views of church interiors in the Italian style, palaces, and chambers. The interior view of the Church of Amsterdam, painted by Ruisdael, deserves especial notice. In the 18th c., the Venetian Canale and his nephew Bellotto (generally known by the name of Canaletto), painted many views of cities, but especially of the canals and buildings of Venice. Collections of their numerous works are found at Dresden, Woburn Abbey, &c.

In recent times, A. P. has been very successfully cultivated in Germany, France, England, Holland, and Belgium. Schinkel is celebrated for his fine union of classical taste with richness of decorative invention. His two most striking works are St. Peter's, and the Duomo at Milan; Paul Gropius has shown great talent in his Cathedral at Rheims, built in honor of Joan of Arc. His dioramas are well known; and Domenico Quaglio, who died in 1837, throughout his innumerable compositions, has exhibited an exquisite appreciation of perspective, and of the poetical arrangement of details. Among modern A. painters may be mentioned—in England, Prout (views of Italy, Germany, &c.), Robert (whose genius has sought for its materials in Spain and the East, and who paints the architecture of foreign lands with rare truthfulness and lively vigor), Mackenzie, Goodall, Williams, and the water-color painters Haghe, Chase, Howse, and others; in France—Granet (died 1849), the most celebrated art painter of the new French school; and the water-color painters Ouvrié, Garnery, Rochebrune, and Villeret; in Italy—Migliara and Nehrlich (a German, who has been styled 'the modern Canaletto'); in Germany—Von Bayer, Hasenpflug of Halberstadt (who paints beautifully old cloister-alleys under winter-effects), Ainmuller, Vermeersch, Pulian of Düsseldorf (who displays great skill in the representation of old streets and time-worn churches), Conrad, Gärtner, Grœb, Helfft, Dietrich, &c.; in Holland and Belgium—Waldorp, Carsen, Boosborn, Von Haanen, Ten Kate, Springer, and Bossuet.

A'RCHITECTURE (Lat. *architectura*, from the Gr. *architecton*, the chief fabricator, the architect), the art of building or constructing. In this country, A. is usually divided in Civil, Military, and Naval. In the present article we shall confine ourselves to the first, the two latter being treated of, the former under the head of FORTIFICATION, the latter under that of SHIP-BUILDING. Civil A., when taken in the widest sense, may be regarded either from an artistical, a scientific, or a utilitarian point of view. In the first case, as a means of giving external form and sensible expression to mental conceptions or ideas, it is a branch of æsthetics, or of the fine arts properly so called (see ART), and takes rank with sculpture and painting; in the second case, it consists in a knowledge of certain laws, of physical nature, and a consequent power of calling them into play, or counteracting their operation, and is consequently a branch of that wider department of science to which the name of *Mechanics* (q. v.) is given; whereas in the last it becomes a practical art, which has for its object the application of the principles, both artistic and scientific, which A. embraces, to the elevation of national and individual character, and the increase of the physical comfort and well-being of mankind. But though it admits of being thus analyzed or separated in thought, it must not be imagined that A. can exhibit in practice any one of these principles to the exclusion of the others.

The abstract conception of all-pervading deity, as embodied in the Greek temple—the religious aspiration after a personal god, as shadowed forth in the Gothic cathedral—can be realized only in accordance with the principles of mechanics, and the most rigorous adaptation of means to ends; whereas, in an opposite direction, the kraal of the Hottentot, the hut of the Indian in the American wilderness, or even the vulgar chimney-stalk in the dingy manufacturing suburb, if properly constructed for their respective purposes, will be found to have obeyed such æsthetical principles as they may have come in contact with. Nature is not self-contradictory; and art and science, beauty and utility, when rightly understood, are never in conflict. A celebrated German writer and thinker (F. Schlegel) has described A. as 'frozen music;' and the comparison is in accordance with the remarks which we have made; for music, though apparently the freest and most lawless, is in reality the most rigorously scientific of the arts. But though a strict adherence to all the principles of A. be indispensable to every genuine architectural structure, whatever be its object, it by no means follows that equal prominence must be given to each of these principles on every occasion. If a building has for its primary object the expression and commemoration of such feelings as grief, gratitude, devotion, or the like, this object manifestly will be best attained by subordinating the scientific and utilitarian to the æsthetic principles of A.; and the reverse will be the case where mere convenience, and also, though in a lesser degree, where convenience, in combination with beauty or magnificence, is sought. It is in a great measure by the prominence which they have given to one or other of these principles, that different nations have displayed their diversities of character in their A. The speculative and poetical character of the Greeks was exhibited in their temples, whilst their preference of the state to the individual appeared in the fact that these structures were designed for the worship of the protecting divinity of the city by the citizen, not for the worship of a personal god by the individual man. Amongst the Romans, again, terrestrial power and material aggrandizement were the exclusively national aspirations, and consequently their A. had their own honor and glory primarily in view. The basilicas, amphitheaters, and triumphal arches of the Romans were their own; but the temples which they raised in honor of the gods, were little else than imperfect copies from the Greek, with scarcely any assignable national characteristics. Then, when we come to medieval times, though, on the revival of spiritual tendencies, æsthetic principles again become prominent, they exhibit themselves under totally different forms; and the distinctions between heathen and Christian thought could scarcely be more distinctly stated in words than they are exhibited to the eye in the difference between a Greek temple and a Gothic cathedral. Even the relation which subsists between Christian and Mohammedan A. (Gothic A. and Arabian A., q. v.) strikingly reminds us of the fact that Mohammedanism was but a sort of bastard Christianity.

Domestic life again appeared in full purity and vigor only in modern times; and then only do we see the utilitarian principles of A. finally prevailing over the æsthetic. But apart from the mental characteristics and tendencies of a people, there are many other circumstances which modify their A. Of these, one of the most important is climate. Arrangements for the permanent and commodious residence of the family within doors could not be expected to attain much perfection amongst a race like the Greeks, whose life was spent in the open air; and the climate of Holland, as well as the genius of the people and the character of their occupations, has had much to do with the fact that the Dutch have rarely risen above a town-house. Following thus the peculiarities of national character and circumstances, it is obvious that the more widely these differ in any two nations, the more dissimilar will be the styles of A. which they produce respectively. Moreover, it is apparent that the higher the stage of national development, the more marked will be the character which the A. of a people will assume. A. thus bears a strict analogy to language. Both are an expression of thought, and in the one and in the other, the richness, variety, and precision of the expression will be in proportion to the quantity and quality of the thought to be expressed. Lastly, in the fact that all genuine A. is the expression of the ruling national ideas and forms of thought of some one particular people, we perceive the reason why a building compounded of several styles should be characterless and unpleasing; and why this should be more and more the case, the more characteristic the styles compounded, and the greater the equality preserved amongst them. The Doric pillar in itself, and still more perhaps, the Roman adaptation of it, is the simplest and most rudimentary of all pillars; and what we are in the habit of calling Saxon, is the simplest and most rudimentary of all the styles of Gothic A.; and hence the introduction of a few Tuscan pillars considerably modi-

fied into a Saxon or Romanic church, does not awaken feelings of very decided repugnance, whereas an attempt to combine equally the beauties of the Parthenon and of Cologne Cathedral in the same building would be unspeakably revolting. The limits of the present article preclude us from presenting to the reader a consecutive account of the origin and development of the different styles of A. These will be treated under separate heads (see EGYPTIAN A., INDIAN A., GREEK A., GOTHIC A., ARABIAN A.; see also ARCH, PILLAR, ARCHITRAVE, &c.); and all that can be here attempted is to trace the earlier stages through which A. passed in the historical nations, before it reached the point at which it afforded the means of expressing the feelings or supplying the wants of mankind,

1. The earliest stage of the monumental A. in every part of the world seems to have been that in which it supplied to the existing generation the means of setting a mark on the face of the earth, of a nature so ineffaceable as that it should continue to be visible to future generations. No attempt was yet made to tell the tale either by the form of the monument, or by any figure or inscription engraven on it. Apart from the tradition intended to accompany it, it was speechless—confessedly unintelligible. But it is easy to see how powerful would be the effect of such an erection in preserving that tradition from oblivion, and fixing it down to the particular locality; for so long as a conspicuous object existed, which obviously was the work of human hands, the cause of its existence would be a subject of curiosity, which could be gratified only by inquiries which must lead to a recital of the events intended to be commemorated. It was with this view that Joshua (xxiv. 26) took a stone, and set it up under an oak that was by the sanctuary of the Lord—'And said unto all the people: Behold, this stone shall be a witness unto us; for it hath heard all the words of the Lord.' To this primary class of monuments belong those tumuli or barrows, and conical heaps of stones called cairns, carns, or kearns, which, when they occur in Britain, we perhaps rightly ascribe to the Celtic portion of our forefathers, but which there is much reason to believe have been erected by every race at a certain stage of their progress. The barrow, it is true, is not wholly destitute of architectural arrangements. Occasionally it contains a passage or narrow gallery leading to a square enclosure or small chamber, in which the remains of bones, and of rude urns, drinking cups, and other articles, sometimes of Roman or Brito-Roman manufacture, are found. The barrows are always, however, of the rudest and most inartificial construction, and in considering them, we are only, as it were, on the threshold of architectural science.

2. The earliest class of erections to which this title can with any propriety be given, are those which are commonly spoken of as Druidical temples. These consist generally of separate stones, often of enormous size, raised on their ends, sometimes in a circle, and at other times so as to enclose an oblong space, which in some cases is roofed in by horizontal slabs. These roofing-stones are frequently of such prodigious weight as to give rise to many conjectures regarding the mechanical means by which, and the mechanical knowledge of those by whom, they were placed in the positions in which we see them. These strange, and, to us, almost wholly unintelligible remains of antiquity, when of great extent, assume an air of savage and gloomy majesty. Of this the most conspicuous instance anywhere to be found is that of Stonehenge (q. v.), in Salisbury Plain in Wiltshire. Wherever a Celtic population existed, these monuments are to be found. Druidical monuments are more common in France than in England; and in France, as might be expected, they exist in the greatest numbers and variety in Brittany (q. v.), though none of them approach the magnitude, or, in some respects, the workmanship of Stonehenge. The Celtic monuments of Brittany are of different classes, and have received different names—that which is most architectural in character being the dolmen, or cromlech, as it is called in England. The cromlech consists generally of two rows of perpendicular stones, arranged so as to fit pretty closely to each other, and covered with horizontal roofing-slabs, thus forming a chamber, which is generally of such height as to allow a man to walk through it upright. But the largest and most perfect specimen of the dolmen is to be seen, not in Brittany, but in the neighborhood of Saumur on the Loire. It measures more than 80 feet in length. To the same early stage in the science, though probably to a much earlier period in point of time, are to be referred those cyclopean walls and fortifications which at Tiryns and Mycenæ in Argolis excited the wonder of the later Greeks; the Etruscan walls at Fiesole; and the similar structures which are found both in Central and South America.

3. The next stage in advance of that primeval and pre-historic one of which the traces are thus so widely spread, is that at which the science seems to have culminated in all but the classical nations of antiquity, and those races which have had the benefit of their genius and invention. We have here an accurate measurement of parts, and a corresponding division of the building. The pillar also makes its appearance, though it is by no means used with the same freedom, nor does it exhibit the same variety of form to which it attained in Greek A. The stage of which we here speak was attained by the inhabitants of Central and Southern America before its discovery by Europeans; and in Mexico, even by the Toltecans, an earlier race, which had given way before the Mexicans of the days of Cortes. Peruvian A. exhibits neither columns nor arches; but the remains of the palace at Mitla possesses a portico with plain cylindrical columns; and the walls were covered with rude sculpture. In the cloisters of a building at Palenque, a species of inartificial triangular arch, formed by courses of stones projecting over each other, was found. It is very instructive as showing the natural, and, so to speak, necessary character of certain architectural forms at certain stages of national development, to find that the pyramid, which is little more than a regularly constructed cairn, is met with even more frequently in Mexico than in Egypt; and whether or not we regard it as the primary form of the pagoda of India, it certainly formed the basis both of Mexican and Egyptian A.

The discussions which have been carried on with so much keenness as to the priority of date of Indian and Egyptian A., lose much of their importance when we find a race, acting in all probability independently of both, starting from the same primary form as the one, and in the discovery of the pillar and the arch, making two of the most important of the further steps in advance to which they respectively lay claim. Keeping these facts in view, it would seem, moreover, that something more is required to prove an historical connection between Doric and Egyptian A. than the circumstance that the columns which they respectively employ possess a base, a shaft, and a capital, or that both are used to support an entablature. Even the long unbroken horizontal lines which seem to indicate an affinity between the architectural styles of Egypt and of Greece, and which distinguish them both so sharply from the Christian A. of medieval Europe, may be the result rather of a similarity of circumstances than an identity of origin. Though these styles agree in having columns, and though the columns support horizontal entablatures in each, they disagree in the forms of the columns, in the character of the entablature, and indeed, in almost every other particular. Whilst Greek pillars taper towards the top, and the walls are vertical, in Egyptian buildings the very reverse is the case, the pillars being vertical, and the walls sloped. When the effect of a whole Greek building, surrounded by a colonnade, and of an Egyptian building is considered, a certain similarity appears—the base in each case being wider than the upper part; but the result is produced in the one case by sloping the pillars, and in the other, by sloping the walls, the external edges of which form a slightly acute angle with the base of the building. The great distinction, however, between the A. of Egypt and Greece consists in the stages which they respectively reached. The A. of Egypt retained throughout a character of gloomy strength, and never attained to the lightness, freedom, or variety of that of Greece. In the one case, the traditionary forms continued throughout to dominate and subdue the free spirit of art; in the latter, art triumphed over tradition, and owned no laws but its own. It is in this circumstance that the distinction consists between the stage of A. of which Egyptian may be considered the type, and of which Assyrian, Babylonian, and Persian A. are also examples, and that ultimate stage which was reached by the Greeks in one direction, and by the various Germanic nations in another. See ARABIAN A., BYZANTINE A., and GOTHIC A. See also ARCHITECTURE in AM. SUPP.

A'RCHITRAVE (Gr. *archi-*, chief; Lat. *trabs*, beam), the lowest part of the entablature (q. v.), or that which rests immediately upon the columns.

A'RCHIVES. See RECORDS.

A'RCHIVOLT, the ornamental band or moulding which runs round the lower part of the voussoirs of an arch.

A'RCHON, the highest magistrate in Athens. The government was originally monarchical; but on the death of Codrus (q. v.), the Athenians, according to the traditionary account, resolved that no one should succeed him with the title of king (*basileus*), and therefore appointed his son Medon with the title A. (ruler). The office was at first for life, and confined to the family of Medon; but in 752 B.C., the time of office was limited to ten years; and in 714, the exclusive claims of Medon's family to the office of A. were abrogated, and it was thrown open to all persons of noble birth; afterwards to all citizens, without distinction of rank (477 B.C.). In 683, the office had been made annual, and the number of archons had been extended to nine. The year was named from the first A.; to the second, styled Basileus, belonged the care of religious affairs; the third was Polemarchos, or commander-in-chief; and the remaining six, having to conduct all criminal trials, were styled Thesmothetæ, or lawgivers.—Among the Jews, during the time of their subjection to the Romans, the title of A. had various meanings; but was generally given to the members of the Sanhedrim or supreme council.—In the mystical jargon of the Gnostics, the term A. was frequently employed, and hence one of

their sects, especially opposed to Judaism, received the name ARCHONTICS. See GNOSTICS.

ARCHY'TAS of Tarentum, one of the most illustrious men of antiquity, flourished about the year 400 B.C. His father's name was Mnesagoras. A. is said to have been a contemporary of Plato, and on one occasion to have saved the life of the latter when the tyrant Dionysius wished to put him to death. His public career was glorious. He was seven times elected general of his city, though it was customary for the office to be held only for one year; and in every campaign which he undertook, he was victorious. His civil administration was equally fortunate. Affairs of the highest moment were repeatedly intrusted to him; and yet, though deeply skilled in philosophy and politics, he was possessed of a childlike simplicity of character. He was drowned on the Apulian coast. A.'s virtues were as conspicuous as his talents. He paid the most humane attention to the comfort and education of his slaves, and although one of the greatest geometricians, he did not disdain to make a rattle for the amusement of his children. He solved the problem of the doubling of the cube, and secured almost the reputation of a magician by his numerous mechanical contrivances, the most wonderful of which was the flying pigeon. A Pythagorean in philosophy, he is generally supposed to have exerted a considerable influence on Plato, and some affirm that even the gigantic understanding of Aristotle was indebted to him for the idea of his categories. Only fragments of his writings remain. They relate to metaphysics, ethics, logic, and physics. See also ARCHITECTURE in AM. SUPP.

ARCIDO'SSO, a town of Central Italy, in the province of Grosseto, 23 miles north-east from Grosseto, on a feeder of the Umbrone, among the Appennines. Pop. of commune, 5859.

ARCIS-SUR-AUBE, a small town in the French department of Aube, situated in lat. 48° 32′ N. long. 4° 8′ E., with (1876) 2817 inhabitants, is remarkable on account of the battle fought here, March 20, 21, 1814, between Napoleon and the allied forces under Prince Schwartzenberg. The battle, beginning with several skirmishes on the first, and ending in a general engagement on the second day, when the French retreated over the Aube, was not in itself very important. But Napoleon now formed the plan of operating in the rear of the Allies, and left the road to Paris open; assuming that they would not venture to proceed without attempting first to secure their rear. The Allies marched, nevertheless, on the capital, and thus decided the campaign.

A'RCOLA, or A'RCOLE, a village on the left bank of the Adige, in Northern Italy, 15 miles E.S.E. of Verona, famous for the victory gained by Bonaparte over the Austrians, 17th November 1796. The Austrians, relieved by the retreat of Moreau from the Rhine, had begun to take the offensive in Italy, and General Alvinzy appeared at the head of 50,000 men, with the main body of which he advanced to Caldiero, and threatened Verona. Bonaparte, recognizing the danger, descended by night the course of the Adige, crossed that river at Ronco, and was thus in a position to threaten the left flank of Alvinzy's army, which was posted at A. A causeway leads from Ronco across the morasses to A., before reaching which the road crosses the small stream of the Alpon by a narrow bridge. This bridge was defended by the Austrian general, Mittrowsky, with fourteen battalions of infantry, and two squadrons of cavalry. On the 14th of November, Augereau attacked the bridge with two battalions of grenadiers, but being exposed in flank to the Austrian fire, was obliged to withdraw. Bonaparte now seized the standard himself, and rushed on the bridge, followed by the grenadiers; but again the fire of the Austrians, who were in much greater force than the French, made it necessary to draw back. The struggle was renewed on the 16th with a similar result; and it was only on the 17th that the French succeeded in getting possession of A., not, however, by forcing the bridge, but by sending a column across the Alpon, lower down, and getting in rear of the Austrians. On this Alvinzy was obliged to retreat to Vicenza. It fared no better with the other column of the Austrians under Davidovich. In this series of battles the Austrians lost 18,000 men killed, and 6000 prisoners. The French loss was 15,000.

ARÇON, JEAN CLAUDE D', a distinguished French engineer, born at Pontarlier 1733, was originally intended for the church, but on manifesting a decided preference for the study of Vauban, his father, an eminent jurisconsult, consented to his choice of a military profession. In 1754, he entered the Military School at Mézières, and, in the following year, he passed as an engineer. During the Seven Years' War, he acquired considerable reputation, especially in the defence of Cassel. His fertility of invention was surprising, and of the greatest benefit to that branch of the service with which he was connected. In all his writings—which, in spite of a very faulty style can be read with pleasure—there are indications of a lively, rich, and vigorous genius. He was even bold enough to question the wisdom of certain strategical propositions of the Great Frederick. But his most famous scheme was that by which he hoped to reduce Gibraltar, then in the hands of the English, and defended by Governor Elliot. He contrived floating batteries, incombustible, and not liable to sink, which, however, were not successful, though this is mainly to be attributed to the fact of his efforts being indifferently supported. When the French, under Dumouriez, overran Holland, A. took several strongly fortified places, amongst others, Breda. After this, he retired from public life, and confined himself to the literature of his profession. His most important work is, *Considérations Militaires et Politiques sur les Fortifications* (Paris, 1795). In 1799, Bonaparte called him to the senate, but he died the year after.

ARCOS DE LA FRONTE'RA, a town on the right bank of the Guadalete, in Andalusia, Spain. Its principal manufacture is that of tanned leather, which was the first established in Andalusia; thread and ropes are also manufactured. Pop. 11,270. A. de la F. has a wild and romantic situation, which harmonizes well with the picturesque garb of the inhabitants, who still wear the national costume. It was called Arcos, from being built in the form of a 'bow;' and after Alfonso-el-Sabio had rescued it from the Moors, it received the additional name of *de la Frontera*, from its frontier position, being in the vicinity of the Moorish kingdom of Granada. Almost impregnable by nature, it was furthermore embattled with walls and towers, part of which still remain, and afford a magnificent view of the Ronda mountains. The rich plains that lie below the rocky town are famed in the Spanish ballads for their breed of war-steeds, 'Arcos barbs.'

ARCOT, a city of Hindustan, in the presidency of Madras, the capital of the district of north Arcot. It is situated on the right bank of the Palar, a river which, rising in Mysore, is, in the rainy season, about half a mile wide before the town. It stands in N. lat. 12° 54′, and in E. long. 79° 24′, and is distant from Madras 65 miles. Besides the military cantonment, which can accommodate three regiments of cavalry, A. contains some mosques in a tolerable state of repair, and the ruins of the Nawaab's palace. At the census of 1871, the town of A. (more properly spelled *Arkát*) had a pop. of 10,988. A. is chiefly noticeable for its history. It was the spot where Clive first firmly established his military reputation. With a force of 300 Sepoys, 200 Europeans, and three field-pieces, he marched against A., which was garrisoned by 1100 men, and after having taken it, he stood a siege of fifty days against thousands of assailants, and hardships and privations of every description.

ARCOT, a portion of the presidency of Madras. It consists of two districts, the northern and the southern, of which the respective areas are 7139 square miles, and 4873, and the respective populations, according to the census of 1871, 2,015,278 and 1,755,817.

As most of the rivers are destitute of water in the dry season, there are thousands of tanks in A. Some of them are of an enormous size: that of Cavery-pak, in particular, measures eight miles by three. These tanks are indispensable, as well for irrigation as for domestic use. The hot and parching winds from the west, sweeping down the valleys of the Eastern Ghaats, are often fatal to birds on the wing, and also to human beings when exposed for any length of time. Glass cracks and flies in pieces; and wood shrinks, splits, and shivers; and from the mutual friction of the sapless trees, spontaneous combustion sometimes takes place in the jungles.

A'RCTIC means, properly, lying near the constellation of the Bear (Gr. *arctos*), and hence, northern. The Arctic Circle is a circle drawn round the north pole, at a distance from it equal to the obliquity of the ecliptic, or 23½°. The corresponding circle round the south pole is the *Antarctic* Circle. Within each of these circles there is a period of the year when the sun does not set, and another when he is never seen, this period being longer the nearer to the pole.

ARCTIC HIGHLANDS, a name sometimes applied, though not very appropriately, to that portion of the American continent which lies between Hudson's Bay and the mouth of the Mackenzie. It has been the scene of all, or nearly all, the overland efforts in connection with the exploration of a North-West Passage, from Hearne's discovery of the Coppermine, down to the recent voyage of Anderson—the most prominent among the intermediate laborers having been Franklin, Richardson, Back, Dease, Simpson, and Rae.

A'RCTIC OCEAN, that part of the universal sea which surrounds the north pole. Its single boundary, that towards the south, naturally divides itself into four sections—the northern shores respectively of the two continents, and the northern limits respectively of the two intercontinental oceans.

The A. O. meets the Pacific at Behring Strait, in about 66° of N. lat., so that here the A. O. overlaps the Arctic Circle by about 30′. On the side of the Atlantic, again the common border seems to be equally independent of arbitrary definition, for Scoresby Sound almost as definitely terminates the south-east coast of Greenland as North Cape terminates the north-west coast of

Europe; so that, as both extremes are intersected by about the same parallel of 71°, the A. O. here falls short of the Arctic Circle by about 4½°.

In the Old World, the A. O., if we include its gulfs, stretches south of the Arctic Circle, in the White Sea, fully 2°; while at Cape Severo, the most northerly point of Asia, in lat. 78° 25′ N., it falls short of the same by 11° 55′. Lastly, within the range of the New World, the A. O., in its strict acceptation, is everywhere forced back within the Arctic Circle, about 5° at Point Barrow, about 7½° on Barrow's Strait, and about 3° at the Strait of the Fury and Heela.

The waters of the A. O., however, may conveniently be extended beyond these their strict limits. So far as the mere aspect of the map is concerned, Davis's Strait, Baffin's Bay, and Hudson's Bay may be regarded as gulfs rather of the Atlantic than of the A. O. But if essential characteristics are permitted to outweigh mere position, they must be assigned rather to the A. O. than to the Atlantic. Besides being all fed by currents from the A. O., they are all hyperborean in temperature. Even the most southerly of the three illustrates this. While Hudson's Straits present, in general, more ice than Davis's Strait or Baffin's Bay, Hudson's Bay itself has been the scene of perhaps the two most abortive, if not most disastrous, of all modern attempts at northern discovery. On opposite sides of Southampton Island, Lyons and Back were arrested by impenetrable packs, the one near the Bay of God's Mercy, and the other off Cape Comfort—the latter point being 1½°, and the former being twice as much, south of the Arctic Circle. Reckoning, therefore, to the bottom of James's Bay, as an arm of Hudson's, the arctic seas, thus appended to the A. O. Proper, reach as far south as the parallel of London.

Little as is yet known, at least accurately, of the A. O., its discovery and exploration have developed and tasked more skill and heroism than perhaps the exploration and discovery of all the rest of the world since the age of Columbus. Without anticipating what is to be said on this subject under the heads of NORTH-EAST PASSAGE, NORTH-WEST PASSAGE, and POLAR EXPEDITIONS, it may not be out of place here to state summarily the comparatively easy labors of the Russians while issuing, as it were, from their domestic rivers to survey their domestic shores. About a century and a quarter ago, the Muscovites simultaneously sent forth five expeditions to complete, if possible, the North-East Passage. From the White Sea to the Obi, four seasons were consumed; from the Obi to the Yenesei, four seasons; from the Yenesei to the Lena, season after season was spent in both directions without success; from the Lena to the Kolyma, six seasons were occupied; from the Kolyma to the Pacific every effort was fruitless, though the Cossack Deshneff was known to have accomplished this part of the enterprise about a century before.

Arctic navigation, in fact, is beset by almost every imaginable difficulty and danger. In addition to the peculiar perils of ice in all possible states, the adventurer, often blinded by fogs and snows, has to face, generally without guide or sea-room, the storms, tides, and currents of comparatively unknown waters. If such be his three months of summer, what must be his nine months of winter! Take a general illustration from the personal experience of the most successful of all the arctic navigators. On the parallel of 73°, and under a temperature of 15° degrees below zero of Fah., Captain M'Clure spent the night of 30th October 1851 on the ice, amid prowling bears, and that without food or ammunition—his only guide being a pocket-compass, which, however, the darkness, thickened by mist and drift, rendered useless. The gallant officer whiled away the time by sleeping three hours on 'a famous bed of soft dry snow,' and by wandering 10 miles, by the crow's flight, over a surface so rugged as to endanger his limbs. It was at the close of a pedestrian expedition of nine days, on very short allowance of food and water, that the adventure took place; and it had been immediately occasioned by a generous desire of reaching the the winter-quarters by a nearer cut, so as to have 'a warm meal ready for his men on their arrival.'

Notwithstanding the labors and researches of two centuries and a half, very little of this vast ocean has been even seen by man. To the north of 83° 30′, in fact, the A. O., so far as authentic evidence goes, is a mere blank to geographers, for Parry, in 1827, barely reached lat. 82° 45′; Kane, in 1854, touched only 81° 22′; the *Polaris*, in 1871, reached only 82° 16′; in 1874, the Austro-Hungarian Polar Expedition just reached 82° 5′; and the British Expedition of 1875–6 could advance no further than 83° 20′, the highest latitude ever attained. At all the intermediate points of longitude, the northern limit of geographical knowledge falls short, more or less at every point, of the parallel of 83°. Perhaps the actual average of such northern limit, even on the full tale of 360° of long., may not exceed lat. 75′, so as to leave absolutely unknown a circle of 30° of lat., or nearly 2100 miles in diameter—an area little inferior to that of Europe. This untrodden world, however, is not to be regarded as a continuous wilderness of ice. Parry, at his furthest point, found not an unbroken field, but separate floes, with more or less of open water between them—the mildness of the temperature being indicated by falls of rain: and Kane, again, at his furthest point, saw a free sea to the north, as far as the eye could reach, from a promontory 240 feet high; while, to use his own words, 'a gale from the north-east, of fifty-four hours in duration, brought a heavy swell from that quarter without disclosing any drift or other ice.' This is quite in keeping with the fact already noticed, that Hudson's Straits and Bay are often more encumbered with pack than the waters of far higher latitudes. With regard to currents, Parry, during nearly the whole of his boat-sleigh expedition of 1827, found that his place by reckoning was considerably ahead of his place by observation, or, in other words, that his northward progress on the floes was neutralized more or less by the southward progress of the floes themselves, the existence of a current towards the south being thus shown.

M'Clure derived advantage from the current, whether advaneing through open water, or drifting along at the mercy of the pack. The experience of Weyprecht and Payer was different from that of any preceding navigators, since they found that they steadily drifted *north*. While M'Clure had the fortune to return with the news of the discovery of the North-West Passage, M'Clintock has shown that the discovery must have been anticipated by Sir John Franklin. Succeeding expeditions of which a great number have been equipped by England, Germany France, Sweden, America, Austria, and Denmark, have been mainly directed towards the North Pole. The reports of the expedition of 1875–6 lead to the conclusion that the pole is surrounded by an inaccessible region of ice, to which has been given the name of the Palæocrystic Sea, or Sea of Ancient Ice. The North-East Passage was accomplished for the first time by Professor Nordenskiöld in 1878–79. And repeated successful voyages have been made with cargoes between Western Europe and the mouths of the Obi and Yenisei, by way of the Kara Sea.

The only section of the Southern A. O. that is tolerably well known to a distance from the continent is that which washes the north-east of America. It contains, under the collective name of Polar Archipelago, many large islands. Off the coast of the Old World, again, are Spitzbergen, Nova Zembla, New Siberia, Wrangel Land, King Charles Land, &c. The latest discovery, made by Weyprecht and Payer in 1873, is that of Franz-Joseph Land, an extensive and mountainous tract, lying about 200 miles due north of Nova Zembla. Its south coast is in about 80° N. lat., and it was seen to extend as far north as 83°, occupying at least 15 degrees of longitude. The chief straits are Lancaster Sound, Barrow's Strait, Smith's Sound, Strait of the Fury and Hecla, Wellington Channel, Banks Strait, &c. The chief rivers, all of them on the mainland, are the Obi, the Yenesei, and the Lena, of the first class; the Mackenzie, the Yana, the Indigirka, and the Kolyma, of the second; and many others of the third.

The principal production of the A. O. has been the whale. The whale-fisheries on the west of Spitzbergen, and on both sides of Greenland, scarcely need to be mentioned. But it may not be generally known, that according to official returns as quoted by Admiral Beechey, the Americans had, in two years, drawn more than 8,000,000 of dollars, or upwards of £1,600,000 sterling, from the whale-fishery of Behring Strait alone.

On the side of East Siberia, however, the A. O. produces a more remarkable article of traffic. Here are found, in the greatest abundance, the bones of the mammoth. Spring after spring, the alluvial banks of the lakes and rivers, crumbling under the thaw, give up, as it were, their dead; while the islands lying off the Yana teem with these memorials of antiquity. (See Nordenskiöld's *Voyage of the Vega*, 1882.)

The American half of the A. O., if it cannot boast of fossil ivory presents something still more difficult perhaps to be explained. In lat. 74° 25′, and lat. 76° 15′ respectively, Captain M'Clure and Lieutenant Mecham discovered large deposits of trees, apparently indigenous, of considerable size. Writing of Banks' Island, M'Clure has the following passages: 'From the summit of these hills, which are 300 feet high, to their base, abundance of wood is to be found, and in many places layers of trees are visible, some protruding 12 or 14 feet, and so firm that several people may jump on them without their breaking: the largest trunk yet found measured 1 foot 7 inches in diameter'—equivalent in girth to about 5 feet. Again, 'I entered a ravine some miles inland, and found the north side of it, for a depth of 40 feet, composed of one mass of wood. Some of it was petrified, the remainder very rotten, and worthless even for burning.' Writing of Prince Patrick Island, Mecham has the following passage: 'Discovered buried in the east bank of the ravine, and protruding about 8 feet, a tree of considerable size. During the afternoon I found several others of a similar kind: circumference of first and second tree seen, 3 feet; of another, 2 feet 10 inches. From the perfect state of the bark, and the distance of the trees from the sea, there can be but little doubt that they grew originally in this country.'

A'RCTIUM. See BURDOCK.

A'RCTOMYS. See MARMOT.

A'RCUS SENI'LIS, a not very well chosen term for a change occurring in the corner of the eye, in consequence of fatty degeneration of its marginal part. The term is objectionable, because the change usually commences before the advent of old age, and further, because the *arcus*, or arch, is usually converted into a complete circle by the time that the patient has reached the age of sixty or seventy years. The *arcus senilis* usually commences at or even before the age of forty years, as an opaque whitish crescent, skirting either the upper or lower margin of the cornea; and from this commencement it extends along the edge, till it finally becomes a complete circle, which sometimes assumes a chalky whiteness, and gives to the eye a very peculiar appearance. On careful examination, it may be seen that a narrow interval of partially clear cornea always intervenes between the arcus and the opaque sclerotic. As far as the eye is concerned, the formation of this circle is of little importance, but it is of great diagnostic value to the physician if, as Mr. Canton and several late observers maintain, its presence indicates the coexistence of fatty degeneration of the heart.

ARD, or AIRD, a Celtic root, meaning 'height' (cf. Lat. *arduus*, high), which appears in many geographical names, especially in Ireland and Scotland.

A'RDAHAN, a village of about 300 houses in the portion of Turkish Armenia ceded in 1878 to Russia, 35 miles N.W. of Kars. Its position gives it strategic importance. Its fortress was dismantled by the Russians in the war of 1854–56; in 1878, the Berlin Congress sanctioned the cession to Russia of A., which had been captured early in the war. On account of the severity of the climate, the houses of A. are mainly constructed underground.

A'RDEA. See HERON.

ARDECHE, a department in the south of France, taking its name from the river A., a tributary of the Rhone, includes the most northern part of ancient Languedoc. Greatest length from north to south, 74 miles; greatest breadth, 44. Area, 2130 square miles; pop. (1881) 373,140. A. is almost wholly mountainous. In the north-west of the department, the Cevennes culminate in the volcanic Mont-Mezène, 5972 feet in height. The variety of the numerous extinct volcanic peaks, deep craters, rugged valleys, masses of tufa, grottos, rock-labyrinths, ranges of basaltic columns, gigantic dams, &c., give a most extraordinarily picturesque appearance to the scenery. The upland, which has winter for six or eight months, is devoted to pasturage; but the terraces and valleys near the Rhone enjoy a warm climate, and produce good wine (white and red), olives, figs, almonds, chestnuts, &c. There are manufactures of silk, paper, leather, iron, &c.; and good roads, with water-carriage, facilitate commerce. Lead, iron, copper, manganese, &c., are wrought. The chief towns are Privas, Aubenas, Bourg, St. Andéol.

ARDEE', a town in the west of Louth County, Ireland, on the river Dee, twelve miles inland. It contains two ancient castles—one built about the year 1200, and now used as the town-house; the other, a square building, and now used as a prison. The chief trade is in corn and other agricultural products. The population in 1881 amounted to 2622.

ARDE'NNES, the western division of the slate-plateau of the Lower Rhine. It extends over portions of Belgium, France, and Rhenish Prussia, and consists of a broken mass of hills, for the most part of no great elevation, which gradually slope towards the plains of Flanders. In early times, the name was given to the whole of the region lying between the Rhine and the Sambre, a length of about 160 miles. The average height of the hills is less than 2000 feet; but in the east, Mont St. Hubert attains an elevation of 2300 feet. Large tracts of this region consist not of hills, but of gently undulating plateaus, which are densely covered with oak and beech forests, while other portions are marshy, heathy, and barren. The districts through which the Meuse and other rivers flow, present some extraordinary appearances. The channel of the river is sometimes bound in by rugged and precipitous cliffs more than 600 feet high. The principal rocks of the A. are clay-slate, grauwacke, quartz, &c., interspersed with extensive strata of primitive limestone. Coal and iron mines are wrought in the north-west; lead, antimony, and manganese are also found. There is little cultivation of grain, but multitudes of cattle and sheep are reared.

ARDENNES, a frontier department in the north-east of France, bordering upon the provinces of Namur and Luxembourg in Belgium. It formed a part of the old province of Champagne. Length, from north to south, 63 miles; breadth, from east to west, 60; area, 2020 sq. miles; pop. (1881) 331,832. The north-east of A. belongs to the basin of the Meuse; the south-west is watered by the Aisne; both of these rivers are enriched with affluents, and united by the *Canal of A.* About one-eighth of the whole surface is hilly, and covered with forests and wide tracts of pasturage. In the north extremity of the department, near Givet, marble is obtained; but the prevailing rock is limestone, veined with lead and iron. South of this, and stretching across the department from east to west, are great layers of slate, with hereand there flint, quartz, &c. In the south-east, muschelkalk, rich in iron-ore, abounds; and in the south-west, the soil is composed of arid chalk, a naked, treeless, elevated plain. Only the valleys are fertile, and produce corn. The vine is only cultivated at Mézières, in the south-west. Slate, marble, and iron, porcelain-clay, and sand for making glass are obtained. Excellent work-horses and sheep are reared. There are manufactures of earthenware, glass, marble, woollen cloths, metallic wares, &c. The principal towns are Mézières, Rethel, Rocroy, Vouziers, and Sedan, where Napoleon III. surrendered to the Prussians, September 2, 1870.

ARDNAMU'RCHAN POINT, the N.W. promontory of Argyleshire, and the extreme western point of the mainland of Britain. A light-house was erected here in 1849, which is visible at a distance of 20 miles. For 10 miles around, the country consists of trap, resting on sandstone often hardened, and blue slates. The trap veins form many striking reticulations in the strata. South of the point are found numerous oolitic and lias fossils.

A'RDOCH, a small village in Scotland, county of Perth, 8 miles south-south-west of Crieff, celebrated for a Roman camp, the most entire now in Britain. The camp is 2¼ miles north of the Greenloaning Station of the Caledonian Railway, in the grounds of A. House. The intrenched works form a rectangle 500 by 430 feet, the four sides facing the cardinal points. The north and east sides are protected by five ditches and six ramparts, these works being 270 feet broad on the north side, and 180 feet on the east. A deep morass exists on the south-east, and the perpendicular banks of Knaig Water, rising 50 feet high, protect the camp on the west. The prætorium, or general's quarter, now called Chapel Hill, rises above the level of the camp, but is not exactly in the center, and is nearly a square of 60 feet each side. Three of the four gates usual in Roman camps are still seen. A subterranean passage is said to have formerly extended from the prætorium under the bed of the Knaig. Not far north of this station, on the way to Crieff, may be traced three temporary Roman camps of different sizes. Portions of the ramparts of these camps still exist. A mile west of A., an immense cairn of stones lately existed, 182 feet long, 45 feet broad at the base, and 30 feet in sloping height. A human skeleton, 7 feet long, in a stone coffin, was found in it.

ARDOYE, a town of Belgium, in the province of West Flanders, 17 m. S. from Bruges. Linen-bleaching is the principal branch of industry. Brewing and candle-making are also carried on. Pop. (including the commune, which is not large), 6500.

ARDRO'SSAN, a small seaport town and summer bathing-place in Ayrshire. It owes its rise to the public spirit of the Eglintoun family. Its harbor, which is sheltered by an island off the coast, is one of the safest and most accessible on the west coast of Scotland, and has been greatly improved, at vast expense, by the Earls of Eglintoun. There is a large export of coal from this place, and ship-building is carried on to a considerable extent. On a hill above the town stands the ruins of A. castle, said to have been surprised by Wallace when held by the forces of Edward I. Wallace destroyed the garrison, and threw the dead bodies into a dungeon called 'Wallace's Larder.' Pop. in 1881, 4036.

ARE, the unit of the French land-measure, is a square, the side of which is 10 metres (or 32·809 feet) long (see METRE), and which, therefore, contains 100 square metres = 1076 English square feet. The next denomination in the ascending scale is the *decare*, containing 10 ares; but the denomination commonly used in describing a quantity of land is the *hectare* of 100 ares, = 2.47 English statute or imperial acres.

A'REA (Lat.), is a term in mathematics meaning *quantity of surface*. The calculation of areas, or mensuration of surfaces, is one of the ultimate objects of geometry. The measuring unit is a square inch, a square foot, &c., according to the unit of length. As a figure is thus measured by finding an equivalent for its surface in *squares*, the process is sometimes called the *quadrature* of the figure.

ARE'CA, a genus of Palms, containing several species, having pinnate leaves and double spathes. The fruit is a fibrous one-seeded drupe, a nut with an outer fibrous husk. *A. Catechu*, the PINANG PALM, or Betel-nut Palm, is a native of the East Indies, whose nut yields a sort of catechu. See CATECHU. This Areca-nut, or Betel-nut, is very much used in all parts of the East, the chewing of it with quicklime and the leaf of the betel-pepper being one of the most prevalent habits of the people. See BETEL. The nut is about the size of a hen's egg; the fibrous husk about half an inch thick. It is austere and astringent. It is doubtful if it possesses a narcotic power, or if this is to be ascribed entirely to the leaf which is used along with it. Areca-nuts form a considerable article of trade in the East. The timber of the palm which produces them, and its leaf-stalks and spathes, are also used for domestic purposes. The tree is often 40 or 50 feet high, and in general less than a foot in diameter. The leaves are few, but very

large, their leaflets more than a yard long. In Malabar, an inebriating lozenge is prepared from the sap—*A. oleracea*, the CABBAGE PALM of the West Indies, is a very tall tree, 100—200 feet, whose huge terminal leaf-bud is sweet and nutritious, and is sometimes used for the table as cabbage, but when it is cut off, the tree is destroyed. The stem of this tree, notwithstanding its great height, is remarkably slender. The nuts are produced in great numbers; they are about the size of a filbert, and have a sweet kernel.—*A. sapida*, the New Zealand Palm, is remarkable as extending southward beyond the geographical limits, of any other of its order, as far indeed as lat. 38° 22′ S. It is a small palm, only from 6 to 10 feet high, with leaves 4—6 feet long. The young inflorescence is eaten.—*A. vestiaria*, a native of the East, is so called because clothing is made from its fibres.

ARECI'BO, a town of Puerto Rico, Spanish West Indies, on the north coast of the island. It is the chief town of a province of the same name. It has a considerable trade. Pop. 11,187.

AREIO'PAGUS (Gr. for 'Mars' Hill'), a mount lying to the west of the Acropolis, at Athens, and celebrated as the spot where the most venerable court of justice in ancient times held its sittings. It is not easy to determine satisfactorily why the hill obtained its name; most probably it was on account of sacrifices having been offered there at an early period to the God of War; but all its historic importance is derived from the Areiopagitic Council, the origin of which reaches far back into antiquity, and is ascribed by some to the semi-mythological Cecrops. Orestes, according to tradition, was tried before this court, and it is certain that it must have existed long before the first Messenian War (740 B.C.), for the Messenians, in offering to submit to its decisions certain points of dispute, speak of it, even then, as 'old.' Solon, however, made many changes in its constitution, enlarging its sphere of jurisdiction to such an extent that it ceased to be any longer a mere criminal court, and acquired henceforth social and political powers in addition to the former. Before Solon's time, it was strictly oligarchical. It now became a *tertium quid* between aristocracy and democracy, the new qualification for office introduced by Solon being *property* instead of *birth*. It thus naturally allied itself with aristocracy, so that we can perfectly understand why it should have been considered a check upon the impetuous democracy, though it would, perhaps, be fairer to regard it as a check upon both extremes. It is not known how many members were included in its council. The nine archons—if they had recommended themselves by a faithful discharge of their duties—were elected life-members of it. Solon made the council 'overseers of everything,' and we find instances of their manifold authority in the subsequent history of Greece. They granted money, at the time of the Persian invasion, from a reserve treasury of their own, the ordinary public treasury being empty. After the battle of Chæroneia, they executed all who had deserted their country. In social matters, their powers appear to have been curiously minute. They had officers whom they sent or accompanied into private houses, on an occasion of a festivity, to see that the rooms were not overcrowded; they called to account persons who lived in such riotous extravagance that their example might be considered hurtful to the community, and conferred marks of honor on those of an opposite character. Their sphere of influence seems to have extended itself to religion also. Innovations in the worship of the gods, neglect of the sacred ceremonies, impiety in any form, brought the offenders under the rebuke and punishment of the A. It is likewise asserted that they possessed and exercised great authority in the education of the young, although this statement, and that regarding some charitable functions attributed to them, are of dubious value.

Until the time of Pericles, the brilliant and powerful ruler of the democracy, the A. continued to maintain its ancient dignity. He soon discovered, however, that it would prove an insurmountable obstacle to the realization of his designs if not shorn of its privileges. After much and vigorous opposition, he succeeded in carrying a decree (458 B.C.), by which, as Aristotle says, the A. was 'mutilated,' and democratic tribunals acquired supreme authority. It is, however, far from being clear what were the precise changes which Pericles effected, whether he abridged its powers as a criminal, or as a social and political court. From the high estimation in which it was held for centuries after, in the first of these capacities, we are inclined to think that it was its social and political supremacy that was destroyed. Probably the A. was made responsible to the demus, or body of citizens. It lingered in life for a very long period. We hear of it as late as 380 A.D., and it would seem, from the case of St. Paul, that it possessed in his day a certain authority in religious matters.

ARE'NA, a part of an amphitheater (so called because it was usually strewed with sand, though when a fit of extravagance seized the Roman emperors, they used borax and cinnabar instead), where the combats of gladiators and wild beasts took place. It had four main entrances, and was surrounded by a wall about 15 feet high, so that the spectators were perfectly safe. The name was afterwards applied by the Romans to any building for exhibitions of baiting animals, horsemanship, &c. On the continent, the name has been given to the large summer theaters for dramatic performances in the open air. It is applied also, in a general sense, to any scene of contest or display of power.

ARENA'CEOUS ROCKS. All rocks, composed entirely, or to a large extent, of grains of silex, are included under this title. Beds of loose sand occur extensively in the more recent deposits. The grains, either of quartz or flint, are generally water-worn and rounded. In older deposits, the grains of sand are bound together by silicious, calcareous, argillaceous, or ferruginous cements. It is seldom that a rock is composed of quartzy materials alone; grains or particles of other mineral substances are frequently mingled with the grains of quartz. Silvery flakes of mica are seldom absent; and they often occur in layers parallel to the planes of stratification, causing the rock to split into thin slabs, and exposing a glittering surface. These are called *micaceous sandstones*. When grains of feldspar occur, it is a *feldspathic sandstone*. Often large quantities of calcareous matter, either as cement or as distinct grains, occur; and these are called *calcareous sandstones*. The presence of lime can always be detected by the effervescence which takes place on the application of muriatic or other acid. When the sandstone is coarse-grained, it is usually called *grit*. If the grains are large enough to be called pebbles, it becomes *conglomerate* or *puddingstone;* if the fragments are sharp and angular, it is called *breccia*.

ARENA'RIA or SANDWORT, a genus of plants of the natural order *Caryophylleæ*, differing from Stellaria (Stitchwort, q. v.) chiefly in the undivided petals. The species are numerous, annual and perennial herbaceous plants of humble growth, rarely somewhat shrubby, natives of the temperate and colder parts of the world. Some of them are arctic and alpine plants. Many of them are chiefly found in sandy soils. The flowers are generally small and inconspicuous, but if closely examined, are seen to possess no little beauty. A number of species are natives of Britain.

A'RENDAL, a town on the south-east coast of Norway, situated near the mouth of the Nid-elf in the bay of Christiania, with a population of 5800. It is built partly on poles, partly on rock, and this circumstance, as well as its situation, gives it a very romantic aspect. The bay, which is protected by the island of Tromöe, forms an excellent harbor, and favors the commerce of the town, which is considerable in proportion to its size. A. is intersected by canals; its exports are iron from the neighboring mines, and wooden articles. Ship-building is also carried on; and on a smaller scale, distilleries and tobacco-factories. King Louis Philippe, after the French Revolution, when wandering in the north as Duke of Orleans, made some stay here.

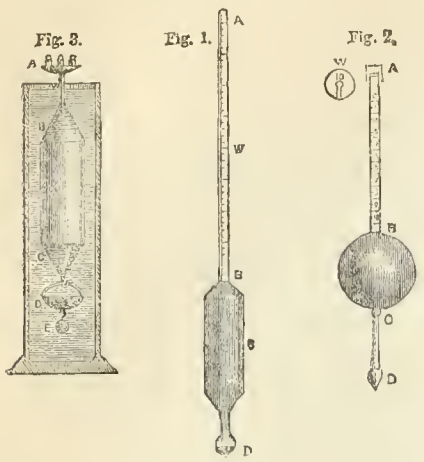
ARE'NG or ARENGA. See GOMUTO PALM.

ARENI'COLA. See ANNELIDA.

AREO'METER (*araios*, thin, and *metreo*, I measure; Fr. *aréomètre* or *pèse-liqueur;* Ger. *Aräometer* or *Senkwage*), called also Hydrometer, an instrument which is allowed to float freely in liquids, to determine their specific gravity or that of solid bodies. By specific gravity (q. v.) is meant the ratio that the weight of any volume of a substance bears to the weight of the same volume of water. Thus, a cubic foot of alcohol weighs 793 ounces, while the same quantity of water weighs 1000 ounces; the specific gravity of alcohol is set down, therefore, as $\frac{793}{1000}$ or ·793. A cubic foot of sulphuric acid weighs 1841 ounces, and has, consequently, a specific gravity of 1·841. These relations are not confined to the particular volume, one cubic foot, of these bodies, but hold for any equal volumes of them. Equal volumes of alcohol, water and sulphuric acid, have always to each other the ratio respectively of 793, 1000, and 1841; and this is only an instance of the general principle, that equal volumes of different substances have weights bearing to each other the direct ratio of the specific gravities of these substances. This is the principle on which areometers with weights, or weight-areometers, are constructed. If, however, equal weights of any two of these liquids were taken, it would be found that ·793 of a cubic foot of water would weigh as much as 1·000 cubic foot of alcohol; 1·000 cubic foot of sulphuric acid as much as 1·841 cubic feet of water; or ·793 of a cubic foot of sulphuric acid as much as 1·841 cubic feet of alcohol: more generally thus—when equal weights of two different fluids are taken, the volumes of each are inversely as their specific gravities.

On this latter principle depends the use of areometers with scales, or scale-areometers. The scale-A. is much more commonly employed than the weight-A., and is, in consequence, a much more important instrument. Of the various forms of scale-areometers, that contrived by Gay-Lussac deserves particular notice, from the simplicity of the mode of graduation; and an account of

it will give the best idea of the general nature of such instruments. Fig. 1 gives a representation of it. It consists of a uniform glass tube, AB, blown into two bulbs, C and D, at the bottom. The lower bulb, D, is loaded with mercury, so that when the instrument floats in any liquid, the stem, AB, is maintained in a vertical position. We shall suppose that the quantity of mercury is so adjusted that when placed in water, the A. sinks to the point W, which may, in consequence, be called the water-point. According to the principle of Archimedes, the weight of the volume of water displaced by the instrument up to this point is equal to the weight of the instrument. Let us suppose, for the sake of simplicity, that the water so displaced is a cubic inch, the weight of the A. will be that of a cubic inch of water, or 250 grains (more correctly 252·5 grains at 60° F.). If the A. be now placed in a fluid heavier than water, such as a mixture of sulphuric acid and water, having a specific gravity $\frac{5}{4}$ or 1·25, it is manifest that if it is sunk again to the water-point, the displaced fluid would weigh $\frac{5}{4}$ of 250 = 312½ grains, or 62½ grains more than the weight of the instrument. As much, therefore, of the stem of the A. must rise above the liquid as will reduce the weight of the displaced liquid to 250 grains, or reduce the volume to $\frac{4}{5}$ of what it was before. If the stem in this case rises to B, the volume displaced by the part WB is $\frac{1}{5}$ of the volume displaced by the instrument at the water-point. If we consider the whole divided into 100 parts, and mark 100 at W, B must be marked 80, as the A. displaces up to that point $\frac{4}{5}$ of 100; and if the intervening space on the stem be divided into 20 equal parts, each of them will correspond with $\frac{1}{100}$ of the water-volume—viz., ·01 of a cubic inch, or with $\frac{1}{100}$ of the weight of the instrument—viz., 2·5 grains. If the same scale be carried above the point W, and the divisions marked as ascending from 100, the A. will be serviceable likewise for fluids less dense than water, and will mark the volumes which it displaces in each of them.



Areometers.

The A. thus graduated gives immediately the volumes which it displaces in different liquids; and from these, seeing that it displaces in every case a weight of liquid equal to its own, the specific gravities may be calculated according to the principle already stated—viz., that equal weights of two different fluids have volumes inversely as their specific gravities. If, in a mixture of sulphuric acid and water, the A. stands at 90, according to the above principle, 90 volumes of the mixture weigh as much as 100 of water; therefore, its specific gravity is $\frac{100}{90}$ or 1⅑. If, again, in a mixture of spirits and water it should stand at 110, 110 volumes of the mixture weigh as much as 100 of water, so that its specific gravity is $\frac{100}{110}$ or $\frac{10}{11}$. In all cases, then, 100 is to be divided by the number read on the A., to determine the specific gravity of the liquid in which it floats.

The delicacy of the A. depends on the distance of the divisions on the scale, or on the thinness of the stem compared with the bulbs. An instrument possessing this advantage cannot be made to serve both for liquids heavier and lighter than water, for the stem would be of an inconvenient length; and it is usual to construct two areometers—one marked with the water-point at the top, and the scale descending to 50, for fluids heavier than water; and the other, with the water-point at the bottom, and the scale ascending to 150, for fluids lighter than water. The scale is generally marked on a slip of paper, which is fixed inside the stem. Gay-Lussac's A. is also known under the name of 'volumometer.' Although it cannot be surpassed either for accuracy or simplicity, it is much less used than other instruments of a similar nature furnished with arbitrary scales, requiring the aid of tables to interpret the readings. The best known of these is Twaddle's A., used in England; and Beaumé's A., extensively adopted on the continent. The A. with an equally divided scale is a very ancient instrument; it was known among the Greeks under the name of 'baryllion.' On some areometers the divisions are not at equal distances, but are so drawn as to give at once, without table or calculation, the specific gravity of the fluid in which they are placed. Although very desirable, in practice they do not possess the accuracy of the A. with equally divided scales, because the graduation of them is attended with considerable difficulty.

No form of A. can be made to determine specific gravities with perfect accuracy, and such instruments are only useful where a ready and good approximation is all that is needed. They are, in consequence, employed chiefly to ascertain the specific gravity of the various liquors and solutions which occur in the arts and manufactures, and very frequently they are graduated with reference to special liquids, as spirits, wine, milk, brine, &c. The Alcoholometer or Hydrometer of Sykes is an instrument of this latter description, and is in general use in the Excise for estimating the strength of spirits. It is represented in fig. 2. BC is a hollow brass ball, surmounted by a flat stem AB, and loaded below by a short conical stem CD, terminated by the pear-shaped bulb D. It is accompanied by eight weights, by which the weight of the instrument may be increased, and the range of the scale extended to fluids heavier as well as lighter than water. One of these weights, W, is shown in the figure; it is furnished with a slit, so as to allow of being slipped on to the narrowest part, C, of the lower stem. The stem, AB, is graduated into 11 equal parts, and these again into halves; and the instrument is so adjusted that its indications give the volumes of water that must be added to or taken from 100 volumes of the mixture under examination to reduce it to proof-spirit (see ALCOHOL), which is a mixture of nearly equal parts of water and alcohol. Thus, if the A. indicates 11 over-proof, 11 volumes of water must be added in order to bring the liquor down to proof-strength; and 100 gallons of such strength would be reckoned as 111; 100 gallons, at 11 under-proof, would in the same way be charged as 89. Very carefully-constructed tables accompany the instrument, in which the specific gravity and percentage of alcohol of different mixtures, at different temperatures, are marked, corresponding to each degree of the A. Since the specific gravity of alcohol is known, it might be thought, that if that of a mixture of it with water were known, the relative proportions of each would also be known. Such, however, is not the case, for alcohol and water possess a chemical affinity for each other, which causes the combined volumes of the two to measure less than the two volumes separately. Thus, 50 volumes of alcohol mixed with 50 volumes of water, does not make 100 volumes of the mixture, but only 96, and thereby the specific gravity of the mixture is higher than it would have been if no contraction had taken place. As the law of this contraction is very complicated, the relative proportions of the two in a combination of given specific gravity, are only to be estimated from tables founded upon experimental data.

The peculiar feature of areometers with weights is, that instead of a scale, they have only one mark on the stem, to which the A. is in all cases sunk. One of the best-known instruments of this kind is the A. of Nicholson. It consists of a brass tube, BC (fig. 3), about 1 inch in diameter, closed above and below by conical ends, to the upper of which a wire is fixed, carrying on the top of it a cup A, capable of containing the weights; and to the lower, a hook is attached, from which hangs the cup D. The lower part of the cup, D, is also provided with a hook, and the whole instrument is kept vertical, partly by the weight of the cup, and partly by the weight of the ball, E, suspended from it. On the wire, a notch, W, is made, to serve as the mark or fixed point to which the A. is sunk. The specific gravities of liquids are determined by Nicholson's A. in the following way: The weight of the A. itself is first ascertained—let it be in a given case 2000 grains—it is then put into water at the temperature 60° F., and weights (say 500 grains) put in, till it is sunk to W. It is now removed to the liquid under examination; and if the weight required to sink the instrument now to the standard-point be only 100 grains, we have the specific gravity of the liquid equal to $\frac{2100}{2500}$, or $\frac{21}{25}$. In both fluids, the same volume has been displaced, and that is in each case equal to the weight of the A.; but the weight of the A. in the second case was 2000 + 100, and in the former, 2000 + 500; hence the above result. Nicholson's A. is seldom used for finding the specific gravity of fluids; its use is almost entirely restricted to ascertaining that of small solid substances, as gems and small pieces of minerals. The following example will show how this is done: If in the cup of the A. already mentioned, when placed in water, the gem be put, and only 440 grains be then necessary to bring the instrument to W, 60 grains is manifestly the weight of the gem, because 500 grains were needed without it to do the same thing. The gem is next placed in the lower cup, D, and if 460 grains are now needed to sink to the standard-point, the gem has thus lost 20 grains of its weight by being immersed in the water. According to the principle of Archimedes (q. v.), these 20 grains are also the weight of a volume of water equal to that of the gem; so the specific gravity of the gem is $\frac{60}{20}$, or 3. By reversing the cup D, which is furnished with perforations, to allow free passage to the air, and attaching the weight, E, to the handle of it, the specific gravity of substances lighter than water may also be determined by this instrument. The other forms of weight-areometers are those of Fahrenheit, Tralles, and Charles. For the more accurate determination of the specific gravities of liquids and solids, see SPECIFIC GRAVITY.

AREQUI'PA, a term primarily applied to a mountain in the west Cordillera of the Peruvian Andes, and secondarily to a city at its foot, being from this, again, extended to a district, a province, a department, and a diocese. 1. The city, which is in lat. 16° 13′ S., and in long. 72° 18′ W., is the third largest in Peru, being inferior only to Lima and Cuzco, and is said to contain 35,000 inhabitants. It carries on a considerable trade both with the interior and by sea. Its port is Islay, one of the largest harbors of the republic. 2. The department is bounded N. by Lima; E. by Ayacucho, Cuzco, and Puno; S. by Moquega, which, along with it, forms the diocese; and W. by the Pacific. It contains 200,000 inhabitants, and is subdivided into seven provinces. Like nearly the whole of the maritime region of Peru, it is generally arid and sterile. 3. The mountain is volcanic, of the form of a truncated cone, and of the height of 20,320 feet. Its neighborhood is subject to earthquakes.

ARÉS. See MARS.

ARETÆ'US, a famous physician of Cappadocia, who flourished in the latter half of the 1st, and in the beginning of the 2d century after Christ. He is considered to rank next to Hippocrates in the skill with which he treated diseases; but he did not, in every instance, follow the practice of the 'Father of Medicine.' He was less attentive to 'the natural actions' of the system, which he frequently counteracted, if he thought it desirable; administered active purgatives copiously, employed narcotics, and did not object to bleeding. He was, in fact, noted for his total want of professional bigotry; and hence, not committing himself to any particular set of opinions, in his accuracy in the detail of symptoms and the diagnosis of disease, he is superior to most of the ancient physicians. His great work, written in singularly elegant and concise Ionic Greek, is divided into two parts. The first four books treat of the causes and symptoms of acute and chronic diseases; the second, the cure of the same. They are almost in a state of complete preservation, and have been translated into various European languages, besides having been frequently edited in the original. The finest edition is the Oxford one of 1723, by J. Wigan; a German translation appeared at Vienna (1790—1802), and an English by T. F. Reynolds, Lond. 1837.

ARETHU'SA. See ALPHEIUS.

ARETI'NIAN SYLLABLES are the syllables *ut, re, mi, fa, sol, la*, used by Guido d'Arezzo for his system of hexachords.

ARETI'NO, PIE'TRO, an Italian author of the 16th c., was the natural son of a gentleman named Luigi Bacci, and was born at Arezzo, in Tuscany, on the 20th of March, 1492. Banished from his native town, he went to Perugia, where he wrought as a bookbinder, and gathered up a few scraps of learning, until, seized with a desire of becoming famous, he abandoned his occupation, and wandered through Italy in the service of various noblemen. At Rome, he distinguished himself by his wit, impudence, and talents, and secured even the papal patronage, which, however, he subsequently lost by writing licentious sonnets. A. now went to the Medicean court, where John de' Medici grew so fond of him that he shared his bed with the adventurer, and even procured him an opportunity of ingratiating himself with Francis I. at Milan in 1524. A few years later, he settled at Venice, where he also acquired powerful friends. The Bishop of Vicenza not only soothed the irritation of the pope against A., but also recommended him to the Emperor Charles V. The latter, as well as his chivalrous rival, Francis, and other great persons, pensioned the fortunate wit, besides enriching him with splendid presents. He likewise obtained considerable sums for his literary efforts.

Nature had undoubtedly gifted A. with some fine qualities, but these were vitiated by his love of sensual gratifications. His death in 1556 accorded with the character of his life. It is said that while laughing heartily at some trifling adventure of one of his abandoned sisters, he fell from a stool, and was killed on the spot. His poetical works include five comedies and a tragedy. The former are full of wit and genuine comic humor; the latter is not without merit. His *Sonetti Lussuriosi* have been translated into French under the title of *Académie des Dames*. Besides these, he wrote a number of other pieces, some of which have not been published. His satire procured for him the name of 'the Scourge of Princes;' but it seems clear that he was equally well fitted to be their sycophant. Although the very impersonation of licentiousness, he had nevertheless the impudence to publish some books of a devotional kind, with the view of obtaining the favor of the pope.

ARETI'NO, SPINELLO, an early Italian painter of great genius, was born at Arezzo in 1316; or, according to others, in 1328. He studied under Jacopo del Casentino; but before he had attained his majority, he had surpassed his master in the vigor and liveliness both of his conceptions and coloring. His reputation attained its full bloom after he went to Florence, where he painted in fresco, in the chapel St. Maria Maggiore, several incidents in the life of the Virgin and of St. Antonio Abate. The monastery of San Miniato, near Florence, contains to the present day a few of his frescoes. He also adorned the monasteries of San Bernardo at Arezzo, and Monte Oliveto near Florence. Vasari thought that the finest works of A. were those which he executed for the Campo Santo at Pisa, illustrating the life of San Ranieri. Of these, however, we have only prints, and cannot therefore judge satisfactorily. His principal works, still remaining, are those from the life of Pope Alexander III. in the town-hall of Siena. He died in 1408.

Throughout all Italy, A. was greatly admired for his invention, the grace and simplicity with which he arranged his figures, and the finish of his style. His Madonnas possessed a remarkable sweetness of expression; and his coloring was in most cases bold and beautiful. Vasari prefers him to Giotto.

ARE'ZZO (ARETIUM), the chief city of the Italian province of A., is situated in a fertile valley near the confluence of the Chiana with the Arno, lat. 43° 27′ N., long. 11° 52′ E. It is 38 miles E.S.E. from Florence. A. is perhaps the oldest town in Tuscany, and formed one of the twelve cities of the ancient Etruscans. It was devastated by Sylla during the Social War; and, like many other Italian cities, was sacked by the Goths when they burst into the peninsula. During the contest of the Guelphs and Ghibellines, in a later age, it became subject to Florence, whose troops defeated those of A. at the battle of Camaldino, in which the poet Dante took part. Arezzo contained (1881) 11,816 inhabitants; but its extensive walls and numerous churches bear record of its more flourishing and more populous period. The *Piazza Grande*, the *Pieve*, an old church founded on the site of a heathen temple, and the cathedral, which, like almost all the other churches, has an unfinished façade, are its principal public buildings. The cathedral has a splendid high altar in marble by Giovanni Pisano; and the several churches contain fine specimens of the old Tuscan school of painting. These ecclesiastical decorations are contrasted with the general aspect of the city, which has dark and dirty streets. Its industry is at present at a very low ebb, there being few or no manufactures, and its people are not generally favorites in Italy; but perhaps no city of its size ever produced a greater number of celebrated men, among whom may be mentioned—Mæcenas, the famous patron of letters in the time of the Emperor Augustus; Petrarch; Pietro Aretino; Guido de A., inventor of the gamut; Leonardo de A., the historian; Cesalpino, the botanist; Redi, the physician; Pope Julius III.; the notorious Marshal d'Ancre; and Vasari, author of *Lives of the Painters*. Michael Angelo was also born in the vicinity of A. The province of A. contains 1276 square miles, with a population of (1881) 238,707. The soil is fertile in corn, wine, and oil.

A'RGALA. See ADJUTANT.

A'RGALI (*Ovis Ammon*), the great wild sheep of Siberia and Central Asia. It is found from Kamtchatka to the Himalaya Mountains, where, however, it is only seen in the more elevated regions. 'We came suddenly,' says Dr. Hooker in his *Himalayan Journal*, 'upon a flock of gigantic wild sheep, feeding on scanty tufts of dried sedge and grass; there were twenty-five of these enormous animals, of whose dimensions the term sheep gives no idea; they are very long-legged, stand as high as a calf, and have immense horns, so large that the fox is said to take up his abode in their hollows when detached and bleaching on the barren mountains of Tibet.' The horns of the male are nearly 4 feet long, and 14 inches in circumference at the base, where they are triangular. The general color is fulvous gray, white beneath, with a whitish disk around the tail. The wool is concealed by hair. The name A. is Mongolian, and was adopted by Pallas. A similar but smaller species is also found on the Himalaya Mountains. The Rocky Mountain Sheep or Big-horn, is sometimes called the American A. See SHEEP.

Head of the Argali Sheep.

ARGAN (*Argania sideroxylon, Sideroxylon spinosum* of Linnæus), a low spiny evergreen tree of the natural order *Sapotaceæ*, a native of the southern parts of the kingdom of Morocco, bearing an ovate drupe about the size of a plum, dotted with white, and full of white milky juice. The Moors extract an oil from the fruit, which they use with their food.

ARGAND, AIMÉ, physician and chemist, was born at Geneva about the middle of the 18th c. He was the inventor of the well-known *Argand lamp*. The chief difficulties that attended the use of lamps as a source of light were—first, in procuring the complete combustion of the oil, so as to keep the flame from smoking; and second, in preventing the level of the oil in the reservoir from sinking as the combustion goes on. The round cotton-wick, used in the old simple form of lamp, was always attended with smoke and smell. The oils and fats are exceedingly rich in car-

bon, containing 70 to 80 per cent. of that element, and only 10 to 12 of hydrogen. The round thick column, then, of oil-vapor rising from the wick of an old-fashioned lamp, presented too little extent of surface to the air; the oxygen of all the air that could get access was chiefly taken up in burning the hydrogen, and a large proportion of the carbon ascended in the burnt air as smoke. A.'s improvement was that he made the wick in the form of a ring, The flame thus became a hollow cylinder with a current of air ascending through the inside, so that the burning surface was doubled. It would appear, however, that the lamp did not satisfy the expectations of A., till his younger brother accidently discovered the effect of a glass cylinder, as a chimney over the flame, by which the flame was steadied, a draught created, and the greatest possible amount of light yielded.

Argand Burner.

A. was soon involved in a dispute with one Langé of Paris regarding the originality of his invention. He went thither to vindicate his claim, but rather than risk the chances of a lawsuit, he consented to share the honor, and a patent was obtained by which Langé and A. alone were authorized to make and sell the new lamps in France for 15 years. The French Revolution, however, destroyed their privilege, and A. retired to England. After some time, he returned to his native country, a victim to melancholy and fantastic humors and died on the 24th October 1803.

ARGAU'M, a village in the territory of the Nizam. It is in lat. 21° 2′ N., and in long. 77° 2′ E., on the route between Ellichpore and Aurungabad. Its single claim to notice is that, on 28th November 1803, about two months after the battle of Assaye, Major-general Wellesley here gained another victory over the Mahrattas. To commemorate this action, a medal was struck in 1851, about a year before the death of the illustrious conqueror.

A'RGEL, or A'RGHEL (*Solenostemma A.*, or *Cynanchum A.*), a plant of the natural order *Asclepiadaceæ*, a native of Arabia and of the north of Africa, deserving of notice only because of the frequent use of its leaves for the adulteration of senna. They are lanceolate, and leathery, and may readily be distinguished from genuine senna-leaves by their texture, their being downy, their greater heaviness, the comparative absence of veins, and the symmetry of their sides, the sides of the true senna-leaves being unequal. They are acrid, and cause sickness and griping, but a difference of opinion subsists as to their possessing purgative properties.

ARGELANDER, Friedrich Wilhelm August, one of the most eminent astronomers of our time, was born, March 22, 1799, at Memel. He studied at Königsberg, where the science of finance first attracted him, but he was subsequently drawn away to that of astronomy by the lectures of Bessel, by whom he was employed to make calculations and observations. In 1820, he was appointed assistant to Bessel in the Königsberg Observatory, and in 1823 succeeded Walbeck as astronomer at the observatory of Abo, in Finland. Here he commenced a series of observations on the fixed stars which have a perceptible 'proper motion.' His studies were unfortunately interrupted by a fire which destroyed the observatory; but after, a time, he resumed them in a new observatory at Helsingfors, and published a catalogue of not less than 560 stars having 'proper motions.' This contained the results of his observations at Abo, and received from the Academy of St. Petersburg the great Demidov prize. After removing to the university of Bonn in 1837, A. published his *Uranometria Nova* (Berlin 1843), containing celestial charts of the fixed stars seen in our hemisphere with the naked eye; also (in 1846) his *Astronomical Observations*, containing the results of an examination of the northern heavens from 45° to 80° declination. His *Atlas of the Heavens* will combine with these works to perpetuate his memory. A. was long engaged in a series of observations on the changes of light in variable stars, and he also demonstrated the theory that there is a progressive motion of the solar system in space. He died in 1875.

ARGE'MONÉ, a genus of plants of the natural order *Papaveraceæ*, distinguished by 4—6 petals, 4—7 radiating concave stigmas, and an obovate capsule, opening by valves at the point. *A. Mexicana*, sometimes called Mexican Poppy, is an annual herbaceous plant with large yellow flowers, and sessile, waved and sinuated, spiny leaves, variegated with white. It is a native of Mexico and of the southern parts of the United States, and is now also common in many tropical and sub-tropical countries, in which it has been naturalized. Its seeds are narcotic, purgative, and diuretic, exhibiting in a strong degree those qualities of the order of which the seeds of the poppy are devoid. They are used in the West Indies as a substitute for ipecacuanha, also instead of opium; and the juice of the plant is employed as a remedy for ophthalmia. —This plant is not unfrequently to be seen in flower-borders in Britain; but in the northern parts, at least, the seed is generally sown in a hot-bed.

ARGENS, Jean Baptiste de Boyer, Marquis d', born at Aix, in Provence, June 24, 1704. He was originally intended for a learned career; but, from a love of adventure, he entered the army at fifteen. Fascinated by a certain actress, he eloped with her to Spain, but was captured, and brought back to Provence. In spite of his glaring breach of discipline, he had the good-fortune to be employed in the French embassy to Constantinople, and on his return, re-entered the army. Being disabled by accidents in military service, and disinherited by his father, he tried his fortune in authorship, and by his *Lettres Juives*, *Lettres Chinoises*, *Lettres Cabalistiques*, and *La Philosophie du Bon Sens* (London, 1737), attracted the notice of Frederick II., then Crown-prince of Prussia, and became a favorite at the court of Prussia when Frederick came to the throne. The king appointed him chamberlain, and a director of the Art Academy at Berlin, with a salary of 6000 livres. He was a constant associate of Frederick, who liked exceedingly his frank and vivacious character, but used to tease him on account of his hypochondriacal fits. When almost a sexagenarian, he renewed the adventures of his youth by again falling a victim to the charms of an actress, Mademoiselle Cochois, whom he married without Frederick's permission. This and other circumstances irritated the despotic monarch, who deprived A. of his pension. The latter now returned to Provence, and died at Toulon, January 11, 1771. His numerous writings, but especially his *Histoire de l'Esprit Humain*, *Lettres et Mémoires*, and those above mentioned, once enjoyed a considerable reputation.

ARGE'NSOLA, Lupercio and Bartolomé Leonardo de, two of the first among the Spanish poets in the 'golden age,' were born at Barbastro, in Aragon; the former in 1565, the latter in 1566. They studied at the university of Huesca. Lupercio afterwards went to Madrid, while Bartolomé entered the church. In character and fortune, however, they were closely united throughout the whole of their career. Both were patronized by Maria of Austria, who appointed the one her chaplain, and the other her private secretary. The latter was subsequently made chamberlain to the Archduke Albert of Austria, and Philip III. appointed him historiographer of Aragon. Bartolomé was employed by the Count de Lemos to edit the *Conquista de las Molucas* (Madrid, 1609); and when this nobleman was appointed as viceroy of Naples, both the brothers A., who had acquired fame as poets, attended his court at Naples, where Lupercio, who then filled the office of Secretary of State, died in 1613. Bartolomé returned to Spain with the viceroy in 1616, and occupied the position formerly held by his brother, as historiographer of the kingdom of Aragon, where he proceeded with the work left unfinished by Lupercio—a continuation of Zurita's *Annals of Aragon*. While engaged in this work, he died, February 26, 1631. The collected poems of the two brothers were first published in 1634, by the son of Lupercio, and passed through several editions. These poems (*Rimas*) consist of epistles, odes, sonnets, and satires, and are singularly alike in character. They are imitative of the style of the Latin poets (especially Horace, for which reason the brothers have been styled 'the Spanish Horaces'), and display more care and polish than originality of invention or richness of fancy. Bartolomé A., as a prose-writer, is reckoned among the Spanish classics. The style of his continuation of Zurita is a great advance on the original, especially in correctness.

ARGENSON, Marc Pierre, Comte d', a celebrated French statesman, was born in 1696. After holding a number of inferior offices, he succeeded M. de Breteuil as Secretary of State to the war minister in 1742. On the death of Cardinal Fleury, in the following year, the whole care of the war then raging devolved upon him. He found matters in the most deplorable condition. The French troops, decimated by sword and disease, were in full retreat across the Rhine; the Austrians already swarmed in Alsace and Lorraine, and the very political existence of France was imperilled; but A., by his vigor and lucky choice of generals, changed the fortunes of the war in the course of one year. After the victories of Fontenoy and Lawfeldt, and the capture of Bergen-op-Zoom, peace was secured by the famous treaty of Aix-la-Chapelle, signed in 1748. A., however, did not remain inactive; he established the *Ecole Militaire* in 1751, and, by various measures, kept alive the military spirit of the nation. He was an illustrious patron of literature. Diderot and D'Alembert dedicated to him their great *Encyclopédie;* and to Voltaire, whose fellow-student he had been, he furnished materials for his *Siècle de Louis XIV.* In 1756, he was exiled to his estate, it is supposed by the machinations of Madame Pompadour. On her death he returned to Paris, where he died in 1764.

A'RGENT, the French word for silver, is always used in English heraldry to signify that metal. In engraving shields, it is left white.

ARGE'NTA, a town of Central Italy, in the province of Ferrara, and 18 miles south-east from Ferrara, on the Reno, in

the plain near the Marshes of Comacchio. Pop. of commune, 15,926.

ARGENTAN, a town of France, department of Orne, and chief town of the arrondissement of the same name. It has an ancient castle, manufactures of linen and lace, and bleach-fields. Pop. (1876) 5254.

ARGENTEUIL, a town of France, in the department of the Seine-et-Oise. Its priory, now in ruins, was founded in the 7th c., and was by Charlemagne turned into a nunnery, of which the famous Heloïse became abbess. Pop. of A. (1876) 7934.

ARGE'NTEUS CODEX. See ULFILAS.

A'RGENTINE (*Argentina*), a genus of small fishes of the family *Salmonidæ*, of which one is rarely found on the British shores and two or three are found in the Mediterranean. They are chiefly remarkable for the resplendent silvery lustre of their sides, and the abundance of *nacre*, the substance used in making artificial pearls, with which their air-bladder is externally loaded. It consists of a coat of silvery fibres. Upon account of it, they are sought after. They are commonly taken in nets along with anchovies or sardines.

A'RGENTINE REPUBLIC, the confederation of the Rio de La Plata, or River of Silver, South America—the Latinized epithet and the Spanish term being merely copy and original of one and the same misnomer. Lat. 22° 30′—41° S., long. 54°—70° 31′ W. This confederation, as constituted by its reunion with Buenos Ayres in 1859, consists of what may be roughly termed a rectangle comprising 19° of lat. and 18° of long. On the west it is bounded by the Andes, which separate it from Chili and the desert of Atacama; on the north by Bolivia; by Paraguay, Brazil, Uruguay, and the Atlantic on the east; and on the south by Patagonia. The republic embraces 14 provinces. In 1880, the population was estimated at 2,400,000; at the census of 1869, it was as follows:

Provinces.	*Department.*	*Area in sq. miles.*	*Population*	*Chief Towns.*	*Population.*
1. Buenos Ayres,	51	83,615	495,107	Buenos Ayres,	177,787
2. Santa Fé,	4	25,087	89,117	Santa Fé,	10,670
3. Entre Rios,	10	29,955	134,271	Concepcion,	6,531
4. Corrientes,	17	45,454	129,023	Corrientes,	11,218
5. Cordova,	14	58,997	210,508	Cordova,	28,523
6. San-Luis,	8	24 151	53,394	San-Luis,	3,748
7. Santiago,	8	38,799	132,898	Santiago,	7,775
8. Mendoza,	8	30,699	65,413	Mendoza,	8,124
9. San-Juan,	4	18,772	60,319	San-Juan,	8,353
10. Rioja,	7	31,103	48,746	Rioja,	4,489
11. Catamarca,	8	35,780	79,962	Catamarca,	5,718
12. Tucuman,	9	23,386	108,953	Tucuman,	17,438
13. Salta,	16	63,461	88 933	Salta,	11,716
14. Jujuy,	9	3 ,527	40,379	Jujuy,	3,071
Total,	173	542,786	1,736 923		

Foreigners—of whom there were reckoned to be about 200,000 in the republic, consisting of Americans, Italians, Spaniards, French, English, Swiss, Germans, and others—are included in these numbers. The A. R. claims, besides the provinces enumerated, the desert of Gran Chaco in the north; and that which, in the south, lies between the Rio Colorado and the Rio Negro; Chili used to claim the south of Patagonia, but has now made a treaty in favor of the A. R. These wide and wild domains, however, have been hitherto sources rather of disquiet than desirable acquisitions, as the Indians occasionally commit inroads.

Except the most purely Indian districts to the west of Buenos Ayres, the provinces of the A. R. lie chiefly in the basin of the Rio de la Plata, embracing much the larger half of the same. Mountains abound in the north-west; and elevated ranges are found also in Entre Rios, which is situated, as its name implies, between the Parana and the Uruguay. But, with these exceptions, nearly the whole country presents boundless plains, covered alternately with rich pasturage and gigantic thistles. The climate and productions vary considerably—being tropical and temperate respectively to the north and south of Corrientes (in 27° 27′ N. lat.). Agriculture, however, of every description is very backward—less perhaps than $\frac{1}{1000}$ of the surface being under cultivation. The rearing, in fact, of live-stock is the grand business of the country. Millions of cattle wander at will across the plains, or are kept on breeding-estates of vast extent; and likewise of mules and horses there are immense bands. Besides the Rio de la Plata, which is rather an estuary than a river, and its far-reaching affluents, the hydrography of the A. R. comprises the head-waters of some southern streams, which fall into the open Atlantic, such as the Rio Colorado, the Rio Negro, &c.; and along the west border, under the shadow, as it were, of the Andes, salt-lakes are common. In connection, doubtless, with this feature in the hydrography, mines of rock-salt exist, and salt here and there abundantly encrusts the plains, both to the satisfaction and benefit of the roaming herds. The names of the country and its estuary are, as already characterized, to a great extent, misnomers, yet silver ore, gold, copper, sulphur, coal, and alum, have been found near the Andes. Little mining has yet been done. The export trade, chiefly in hides and wool, is increasing, and there are several lines of railway.

In 1515, Juan Diaz da Solis, while searching for a passage into the Great South Sea newly seen by Balboa, entered the Rio de La Plata. In 1526, Sebastian Cabot, son of the discoverer of Newfoundland, penetrated nearly to the confluence of the Parana and the Paraguay, being arrested by the rapids, which afterwards gave name to Corrientes. In 1535, Buenos Ayres was founded, to command, though indirectly, the most practicable channel of the only outlet of the country, a city which, in conjunction with its own colony of Monte Video, on the opposite bank, has virtually monopolized the history of a region equal in extent to Western Europe. Gradually other cities were planted, partly by colonists from Spain, and partly by adventurers from Peru, each city generally giving its own name to its own province. The chief staples of the country—horses and cattle—had been largely introduced before 1552. Down to 1775, the basin of the Rio de La Plata was a dependency of the viceroyalty of Lima. In that year, however, was erected the viceroyalty of Buenos Ayres, which, to the basin in question, added Bolivia, under the name of Upper Peru, thus embracing the head-waters of the Amazon, and also most of the plateau of Titicaca. The year 1806 ushered in a new order of things. Spain, as an ally of France, being then at war with England, both Buenos Ayres and Monte Video were occupied by the English—a change which, brief as was its duration, virtually sowed the seeds of revolution. The colonists had felt the inconvenience of belonging to a state which had left them, in a great measure, to defend themselves; they had successfully tried their strength against a foe more powerful than their own masters; and they had been encouraged not less by the sayings, than by the doings, of their invaders to assert their independence. These influences were, in fact, instantaneously exemplified. The triumphant militia, after deposing and expelling the legitimate viceroy for cowardice, elected in his stead the French officer who had led them to victory. Thus had the viceroyalty of Buenos Ayres become peculiarly ripe for taking its share in the outbreak, which Napoleon's dethronement of the Bourbons, in the spring of 1808, almost immediately occasioned throughout Spanish America. The constituents of the A. R. did not, however, submit to the sovereignty of Joseph Bonaparte when he was shuffled on to the Spanish throne to replace Ferdinand VII. In 1810, they organized a government in the name of the latter monarch. This arrangement, which lasted only for a short and inglorious period, ended, like a great many others, in utter confusion. In 1816, a General Congress declared the independence of the 'United Provinces of Rio de La Plata;' but those provinces, in 1827, returned once more to a state of isolation. In 1831, Buenos Ayres, Entre Rios, Corrientes, and Santa Fé, sometimes classed as the coast or riverine states, entered into a federal compact, and invited the others to form a voluntary alliance with them.

This Argentine Confederation led to little but anarchy till 1835, when General Rosas was elected captain-general or governor of it, with all but absolute power. He secured quiet and order for a time; but the great aim of his policy, both warlike and commercial, being to achieve the supremacy of Buenos Ayres, the struggles with this end in view, to which he was goaded on also by personal ambition and reckless daring, led to his ultimate overthrow in 1851. Buenos Ayres, refusing to submit to Urquiza, the next governor of the A. R., declared itself independent in 1854; but was compelled by a signal defeat at Cepeda, in 1859, to re-enter the confederation. Continuing restless, however, another war, in which its army was ably led by General Mitré, placed that province in the position of supremacy which it still holds. In 1865, the A. R. became involved, along with Brazil and Uruguay, in a war against Paraguay, which ended only with the death of Lopez, President of Paraguay, in 1870, and which accomplished little in the interest or to the credit of the A. R. The boundless interior of this country has a standing feud with the narrow sea-board which shuts it out from the ocean. The Banda Oriental has been a bone of contention between the Brazilians and the Argentines; and the jealousies also of Buenos Ayres and Monte Video are constant sources of irritation. Till of late, the relations with Chili were unfriendly, owing to disputed territory in Patagonia. See White, *Cameos from Silver Land* (1881); Mulhall, *Handbook of the River Plate Republics* (1875); Lopez, *Historia de la Republica Argentina* (1883).

A'RGES, a genus of small fishes of the family *Siluridæ*, of extreme interest on account of their being frequently thrown out in vast numbers by some of the South American volcanoes, with torrents of muddy water. Humboldt was the first accurately to inquire into this wonderful fact, and to describe one of these fishes, which he referred to the genus *Pimelodes*, and called *P. cyclopum*. It is now called *A. cyclopum*. The quantities of these fishes ejected from the volcanoes in the neighborhood of Quito is sometimes so great, that the stench of their putrefaction is felt at a

great distance, and putrid fevers are caused by it. They are expelled from craters or from lateral openings at an elevation of 16,000 or 17,000 feet above the sea. It is supposed that they exist in lakes within the cavernous recesses of the mountains, but nothing is positively known on this subject. Their capacity of enduring the high temperature of the water with which they are ejected has excited much interest. Several species are known, to which the common name of *preñadillas* is given in the country, and which are placed by ichthyologists in the genus *A.*, and the closely allied genera *Brontes* and *Astroblepus*.

A'RGIL, clay or white clay, a term now little used, but of which the derivative *argillaceous* is still in frequent use as descriptive of soils, geological deposits, &c., and in the name of *Argillaceous Slate* or *Argillaceous Schist*, instead of which, however, the name *Clay-slate* (q. v.) is more generally employed. The term *argillaceous* is rather vague, and sometimes *clayey*, sometimes *aluminous*, would seem to be its equivalent. See ARGILLACEOUS ROCKS.

ARGILE PLASTIQUE, a series of beds at the base of the Tertiary system in France, resting on a conglomerate or breccia of rolled and angular chalk-flints. They consist of extensive deposits of sand, with occasional beds of plastic clays, used for pottery. Marls occur, enclosing, in some places, the fluviatile shells that are met with in the same position in the London basin, and in others, large numbers of a species of oyster. Beds of impure lignite also occur.—The A. P. is the equivalent in the Paris basin of the Woolwich and Reading series, or Lower Eocene of the English geologists. See EOCENE.

ARGILLA'CEOUS ROCKS. All rocks composed entirely or to some extent of clay are included under this title. Pure clay is known as *kaolin* or *porcelain clay*. It is a hydrated silicate of alumina. Decomposed feldspar, from which the silicates of potash, soda, &c., have been washed out, supplies the material which forms kaolin. *Common clay*, however, contains many impurities; the chief are sand, in variable proportions, and oxide of iron, which gives its color to the mass. Any matter that contains sufficient alumina (more than 10 per cent.) to enable it to retain its shape when moulded and pressed, is called clay. Plastic clays occur abundantly in the superficial deposits and in the Tertiary strata. The older clays become more or less indurated. When they are regularly laminated, and split into thin layers in the direction of the laminæ, they are called *shale*. In *clay-slate*, the clay has become highly indurated and metamorphosed, so as to split into plates that are altogether independent of the original lamination, and frequently cross it at right angles. Clay-slate forms extensive deposits in the Azoic rocks, but it is not confined to these, for the Palæozoic shales are often converted into clay-slate, when, from their proximity to crystalline rocks, or other cause, they have been subjected to the action of heat.

A. R. can generally be distinguished by the peculiar 'argillaceous' odor which they give out when breathed upon.

A'RGOL is a crude variety of cream of tartar which forms a crust in the interior of wine-vats and wine-bottles. Originally, it exists in the juice of the grape, and is soluble therein; but during the fermentation of the juice, and as it passes into wine, much alcohol is developed, which remaining in the fermenting liquor, causes the precipitation of the A.; the latter being very sparingly soluble in an alcoholic liquid. Some wines, when they are bottled, are not fully ripe, and more alcohol being thereafter developed, a further precipitation of A. takes place as a crust in the bottles, and hence the meaning of the term *crusted port*. A. is generally of a reddish tinge, obtained from the color of the grapes, but sometimes is of a grayish-white color, when it has been deposited during the fermentation of the juice of colorless grapes. The *red* or *white A.* is denominated in commerce *crude tartar*, and its principal uses are in the preparation of cream of tartar (q. v.) and tartaric acid (q. v.) The constituents of A. are bitartrate of potash (cream of tartar), (KO,HO,T), tartrate of lime, with coloring and extractive matters.

A'RGOLA. See ADJUTANT.

A'RGOLIS, the north-east peninsula of the Morea (Greece), lying between the Bays of Nauplia and Ægina, forms a nome, or department, in the modern kingdom of Greece. The plain of Argos, famous in ancient times for its breed of horses, is naturally fertile, but is now made pestilential by morasses. It is surrounded by an eastern continuation of the range of mountains on the north of the Peloponnesus, which also girds the riven and shattered-looking coast. The highest summits attain an elevation of between 5000 and 6000 feet. The plain of A. is the most extensive in the whole peninsula, being 12 miles in length, and 5 in breadth. The eastern part is higher and more rocky than the western. Near where the plain opens on the sea, the ground is marshy. This was the Lernean marsh of antiquity. The nome of A. and Corinthia has now Nauplia as its capital, and contains 127,820 inhabitants.

It was from the importance of the ancient kingdom of A. that the Greeks were collectively often styled Argivi by ancient writers. A. was colonized in very early times. According to the old traditions, Inachus, the Pelasgic chief, settled here in 1800, and Danaus in 1500 B.C., with colonists from Egypt. Here Pelops ruled, and was succeeded by Atreus, Agamemnon, &c. Here also Hercules was born, and achieved his victories over the Lernean hydra and the Nemean lion.

The ancient capital, Argos, was situated about 3 miles from the sea, and was considered the oldest city in Greece. It was supposed to have been built by that Inachus of whom we have spoken, or by his grandson Argus; but as the whole period in which his deeds are said to have been accomplished belongs to the unhistorical age, we cannot possibly determine the truth of such a statement. It is certain, however, that at one period A. was the head of a league composed of several Doric states or cities—Cleonæ, Phlius, Sicyon, Trœzen, Hermione, Ægina, and Epidaurus. Latterly, Sparta robbed it of its supremacy and influence. The population of A., during its most prosperous condition in ancient times, was—inclusive of the town-territory—upwards of 100,000. It was noted for the attention it paid to the worship of the gods. Juno was the principal divinity, but many of the other gods had temples and statues also. This gave a stimulus to the fine arts, and we know that A. possessed one of the most famous of the ancient schools of statuary. The natives were, moreover, renowned for their love of music. Herodotus considered them the finest musicians in Greece. They do not, however, seem to have cultivated literature. Few poets, and no orators or philosophers, were born amongst them. The modern Argos, built on the site of the ancient, is 7 miles from Nauplia, and is a large and thriving town. It still exhibits some remains of antiquity, though these were nearly wholly destroyed in 1825, during the Greek war of independence. Cotton, vines, and rice are grown. Pop. 11,000.

A'RGONAUT (*Argonauta*), a genus of cephalapodous mollusca, pretty generally known by the name of *Paper Nautilus*, and in consequence of similarity in the form of the shell, often confounded with the genus *Nautilus* (q. v.), but in fact much more nearly allied to the Poulpe (*Octopus*). The shell is not chambered like that of the true nautilus, but has one spiral cavity, into which the animal can entirely withdraw itself. The animal has no muscular attachment to the shell, and some naturalists therefore suspected that it might be merely, like the Hermit Crab, the inhabitant of a shell originally belonging to some other animal; but this question has been set at rest by the observations of Madame Power, proving the beautiful but fragile shell to be the production of the A. itself. It has, however, also been discovered that the shell is peculiar to the female A., and does not answer the ordinary purposes of the shells of mollusca, but rather that of an 'incubating and protective nest.' The eggs, which are very numerous, are attached to filamentary stalks, and by these the whole compacted mass is united to the involuted spire of the shell, where it is usually concealed by the body of the parent. The descriptions, until recently admitted into the works of the most respectable naturalists, of argonauts sailing about in pretty little fleets upon the surface of the water, employing six of their tentacula as oars, and spreading out two, which are broadly expanded for the purpose, as sails to catch the breeze, are now regarded as entirely fabulous, and indeed are founded upon an entire misapprehension of the position of the animal in its shell, and of the use of the two expanded arms or *vela* (sails). The membranes of these arms are extended at the pleasure of the animal, so as to envelop the shell, and appear to be the secreting organs employed in its fabrication. Two species of A. are common in the Mediterranean. Fig. 1 represents one of them as it used to be commonly represented with oars and sails. Fig. 2 represents it as it really exists, with the membranes of the dorsal arms covering the shell. The other arms are cut off. At *a* in fig. 2, is seen the mass of eggs.

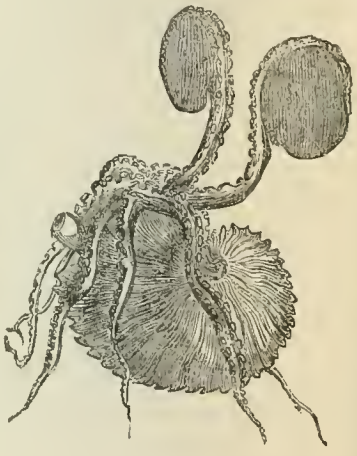


Fig. 1.

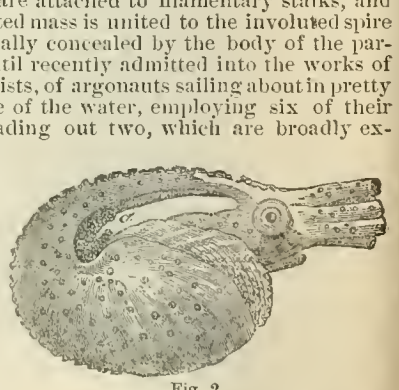

Fig. 2.

A'RGONAUTS, heroes of Greek antiquity (so named from their ship *Argo*), who, according to tradition, about a generation before the Trojan war, undertook a long voyage into unknown seas, under the command of Jason. Homer alludes to the story; Hesiod, Mimnermus, Pindar, the Pseudo-Orpheus, and many others relate it, all in different ways, the accounts in some instances being utterly irreconcilable. The plainest and most complete narrative is that of Apollodorus, which is as follows: Jason was commissioned by his uncle, Pelias—who ruled over Iolcus, in Thessaly—to fetch from the country of Æetas (Colchis) the golden fleece of the ram, which was suspended on an oak, and guarded by a sleepless dragon. He therefore caused Argus, the son of Phrixus, to build a ship of fifty oars; and in pursuit of this adventure, gathered together the choicest heroes from all parts of Greece, fifty in number, with whom he sailed. Their first landing-place was Lemnos, where the A. stayed two years, because the women, in consequence of the wrath of Aphrodite, had slain all the men, excepting Thoas. Next they sailed to the Doliones, and were hospitably received by King Cizycus, who was afterwards accidentally killed by Jason. After landing at Mysia, where they left Hercules and Polyphemus—who had wandered too far inland in pursuit of the lost Hylas—they came to the country of the Bebryces, where King Amycus was killed by Pollux, or Polydeuces, in a pugilistic fight. They next sailed along the coast of Thrace to Salmydessus, where two of their number, Zetes and Calais, having delivered the blind seer, Phineus, from certain winged monsters called Harpies, he in return gave them good counsel respecting their future adventures, and especially warned them against the dangerous passage between the opening and closing Symplegades, from which they escaped with but little injury to their vessel. The story goes that Phineus advised the A. to let loose a dove when they approached the dreaded rocks, and to judge from its fortune what they themselves might expect. The bird escaped with the loss of its tail. The A. resolved to risk the passage, and after heroic efforts, got safely through, their ship only losing some of the ornaments of its stern. After visiting several other lands, they arrived at the month of the river Phasis, in Colchis. Here the king, Æetes, promised to give up the golden fleece to Jason, on condition that the latter should yoke to a plough the two fire-breathing bulls with brazen hoofs, and should sow the dragon's teeth left by Cadmus in Thebes. Jason, by the help of the famous sorceress Medea, daughter of Æetes, who had fallen passionately in love with the bold navigator, fulfilled these conditions; and was assisted by Medea in still more wonderful exploits. He obtained from her, under promise of marriage, a charm against fire and steel, and was enabled to destroy all the warriors who sprung up from the land sown with the dragon's teeth. While this was taking place, Æetes had resolved to burn the ship *Argo*, and put to death the crew; but Jason, informed of the scheme by Medea, anticipated it, hastened into the grove, stupefied the dragon-sentinel by an opiate-charm prepared by Medea, seized the golden fleece, and, embarking in the *Argo* with his mistress and her brother Absyrtus, sailed away from Colchis by night. Æetes followed, but was hindered in his pursuit by an atrocity committed by his fierce daughter.

It is said that she slew her brother Absyrtus, and cut him into several pieces, which she threw overboard, one at a time. While King Æetes stayed to gather up the fragments of his son, Jason escaped from the pursuit. The A. now reached the mouth of the river Eridanus; but were driven on the Absyrtian Islands by a storm sent from Jove, who was angry on account of the murder of Absyrtus. Meanwhile the mast of the *Argo*—which had been cut from the sacred grove of Dodona—delivered an oracle to the effect that Jove could not be appeased unless they sailed towards Ausonia, and were purified by the expiatory agency of Circe. This was accomplished; and next, the A. passed by the Sirens, from whose charms they were preserved by Orpheus, who sang to them, but could not hinder one of their number, Butes, from swimming off to the sea-maidens; then through Scylla and Charybdis, by the help of Thetis, and at length landed on the island of Corcyra, where Alcinous ruled. On leaving this place, they encountered a storm at night, but were saved by Apollo, who, in flashes of lightning, revealed to them the haven of Anaphe, where they raised an altar to their preserver. At Crete, their landing was opposed by the giant Talus, who was slain by Medea. They subsequently touched at Ægina, and sailing between Eubœa and Locris, arrived safely at Iolcus, after a four months' voyage. Jason dedicated the good ship *Argo* to Neptune, at the Isthmus of Corinth.

It is perhaps useless to speculate on the real character of the Argonautic expedition, even if it be more than a mere myth. The accounts given by other writers differ so widely, especially in the geographical parts, from these of Apollodorus, that it becomes impossible to determine satisfactorily whether the expedition sailed north, east, or west. The common historical interpretation of the legend is that Jason sailed on a voyage of discovery, which had for its aim and stimulus the hope of new commercial relations; others would modify this hypothesis, and suggest that the enterprise was partly commercial, partly piratical, and partly adventurous, and that Jason's crew was in all probability composed of young, restless, and ambitious spirits, who were ready for anything that might turn up.

ARGO'STOLI, a seaport on the south-west of Cephalonia, and capital of the island. Its lat. is 38° 10′ N., and long. 19° 59′ E. Its pop. is 8000; and its quay is a mile long.

ARGUELLES, Augustin, a prominent Spanish politician of the modern liberal school. On the breaking out of the War of Independence in 1808, he went to Cadiz, where he agitated for the organization of a regency along with a free constitution, as the best method of strengthening and consolidating the powers and resources of the nation. In 1812 he was sent as representative of his native province to the Cortes, where he was appointed one of the members of the committee to whom were intrusted the drawing up of the plan of a new constitution. His splendid talents as a public speaker soon won him the admiration of the liberal party, who used to term him the Spanish Cicero. But on the return of Ferdinand VII., A. fell a victim to the reactionary spirit which ensued. On the 10th of May 1814, he was arrested and imprisoned; but at his trial he displayed such dexterity that it was found impossible to convict him. Different judges were nominated five successive times, but they could not agree in their decision. At last the monarch himself passed sentence, which was, that A. should be confined for ten years in the prison at Ceuta. He was not, however, alone in his misfortunes. Fourteen persons were condemned along with him, amongst whom was his friend Juan Alvarez Guerra. In their confinement they experienced such barbarous treatment, that in four years three died, two became mad, and the rest received grievous injuries. The revolution of 1820 restored them to freedom. A. became Minister of the Interior, but soon resigned, in consequence of the king complaining of the weakness of the executive. Although provoked beyond measure by the narrow bigotry of the court, he did not rush into extremes, but continued a constitutional liberal to the end of his life. In the Cortes held at Seville in 1823, he voted for the suspension of the royal power; but after the violation of the constitution, he fled to England, where he remained till the amnesty of 1832. On his return to Spain, being nominated to the Cortes, he was repeatedly made president and vice-president of the Chamber of Deputies, and always showed himself a moderate but unwavering reformer. In July 1841, on the discussion of the law regarding the sale of church property, he delivered himself strongly against all concordats with the pope. Next to Espartero, he was the most popular man in the kingdom with the enlightened party. During the regency, he was appointed guardian to the young queen, Isabella, but died soon after, on the 23d of March 1844, at Madrid. In his old age, he still exhibited the fiery eloquence that marked his youth.

A'RGUMENT (Lat. *argumentum*), in Logic, means properly the ground or premiss on which a conclusion is rested; popularly, it is applied to a series of arguments, or to a controversy. *Argumentation* is reasoning put into regular shape, with a view to convince or silence an objector. Logicians have given distinctive names to various kinds of arguments. Thus, we have the *Argumentum ad hominem*, which is no real proof, but only an appeal to the known prepossessions or admissions of the persons addressed. In this style, when a man upholds one method of fraud, he may, by an appeal to his consistency, be driven to uphold another. The A. *ad veritatem*, again, has no regard to anything save objective truth. Next we have the A. *e consensu gentium*, or an appeal to the common belief of mankind, which, of course, may be used to prove or disprove anything. The A. *a tuto* rests upon the supposed safety or prudence of adopting a certain conclusion. It is sometimes used by Roman Catholics against Protestants in the following form: Protestants teach that salvation is possible in any church; this is denied by Catholics; therefore, it is safer to belong to the Catholic Church, as even the Protestant admits that a man may be saved in that church. Lastly, the *Argumentum a baculo* (or use of the cudgel) though objectionable, is concise in its style, and has settled many controversies.

ARGUME'NTUM AD HO'MINEM. See Argument.

A'RGUS, the son of Zeus and Niobe, succeeded Phoroneus in the government of the Peloponnesus, which took from him its name of Argos, as did also the territory of Argolis.—A., surnamed Panoptes (all-seeing), had one hundred eyes, some of which were always awake. He was enormously strong, and on account of the wonderful exploits he performed, Juno appointed him to watch over Io, transformed into a cow. Mercury, being commissioned by Zeus to carry off the cow, slew A. by stoning him; or, as Ovid says, first charmed him to sleep by playing on the flute, and then beheaded him. Juno used the eyes of A. to decorate the peacock's tail.—A. the builder of the ship *Argo* (see Argonauts).

A'RGUS, a genus of gallinaceous birds, remarkable for magnificence of plumage. The only known species is *A. giganteus*, formerly called *Phasianus A.*, and still very generally the A. pheasant. The sides of the head and of the neck are destitute of feathers; the tail consists of twelve feathers, of which the two middle ones in the male are very much elongated; the secondary feathers of the wings are much longer than the primary. The name A. has allusion to the many beautiful eye-like markings which adorn the plumage of the male, and particularly the secondaries of the wings. The long secondaries are said to impede the flight of the bird; but its wings are much employed to aid it in running. The female is of comparatively tame plumage, not only wanting the eye-like markings, but even the length of the secondaries and of the middle tail-feathers. The size of the bird, when divested of its plumage, is not much greater than that of a common barn-door fowl, but the tail-feathers of the male are nearly four feet long. The A. is a native of Sumatra and other eastern islands, of the peninsula of Malacca, Siam, &c. It is said to be found even in the northern parts of China. It is impatient of confinement, and has very seldom been brought alive to Europe.

Argus Pheasant (*A giganteus*).

ARGY'LE, Archibald Campbell, Marquis of, an eminent political character of the 17th c., was born in 1598, and succeeded to the earldom of A. in 1638. Already he had given proofs of that strength of religious principle which marked his whole life, and of a perilous union of attachment to the king and of faith in the principles against which the king made war.

In the General Assembly at Glasgow, in November 1638, he openly took the side of the Covenanters, and thenceforth became recognized as their political head. In 1640, he commanded a military expedition through Badenoch, Athole, Mar, and Angus, for the purpose of enforcing subjection to the Scottish Parliament. On the king's visit to Scotland, in 1641, he found it convenient to show peculiar favor to A., and created him a marquis. On the breaking out of hostilities, H. was still desirous for negotiation, but was finally compelled to take the field. In April 1644, he dispersed the royalist forces under the Marquis of Huntly, in Aberdeenshire. He was less successful in withstanding the genius of Montrose, who, on the 2d February 1645, almost annihilated his army at Inverlochy. His estates had suffered so much in the preceding year from the ravages of the brilliant Cavalier, that a sum of public money was voted for his support. In August (1646), he went to London, with Loudon and Dunfermline, to treat with the parliament for a mitigation of the articles presented to the king. He was at the same time the bearer of a secret commission from the king to treat with the Duke of Richmond and the Marquis of Hertford, on the propriety of a Scottish demonstration in favor of Charles. On the defeat of the 'Engagement' plan, to which he had been decidedly opposed, the government of Scotland devolved on A. and the other Presbyterian leaders. In the parliament of February 1649, Charles II. was proclaimed king, and at Scone, on the 1st of January 1651, A. put the crown on his head. At this time, it was even said that the complaisant monarch intended to marry one of his daughters. As head of the Committee of Estates, A. took vigorous measures to oppose Cromwell's invasion of Scotland, and still adhered to the king, after the subjugation of the country. After the battle of Worcester, he retired to Inverary, where he held out for a year against Cromwell's troops. Falling sick, he was taken prisoner by General Dean. He refused submission to the Protector, but took an engagement to live peaceably, which he strictly kept. On the restoration, he repaired to Whitehall, encouraged by a flattering letter from the king to his son. Impeached with the crime of having submitted to the usurper (to whom he had refused allegiance), he was committed to the Tower, and on the 13th February 1661, was brought before the Scottish Parliament on the charge of treason. He defended himself with spirit, but in vain. On the 27th May he was executed at Edinburgh—having displayed throughout his whole trial, and on the scaffold, the dignity of a true nobleman, and the meekness of a Christian.

His son, Archibald, 9th Earl of A., was early distinguished by personal accomplishments, and exhibited great bravery on the disastrous day of Dunbar, where he commanded a regiment on the royal side. After Worcester, he continued, like his father, in arms, and made himself so obnoxious to the parliamentary leaders, that he was specially excepted by Cromwell from the act of grace in 1654. After much harassing persecution, he submitted to the parliament, but continued to be closely watched. On the restoration of Charles II., he was received into high favor (as a balance to the execution of his father), and unfortunately for his own fame, participated in some of the iniquitous acts of the Scottish legislature. He had, however, numerous and active enemies; and, on the ground of an intercepted letter, in which he had complained of neglect, he was tried and condemned to death by the Scottish Parliament for the imaginary crime of *læsa majestas*. The influence of Clarendon restored him to liberty and favor; even the king himself was prejudiced in his favor; but his explanation in subscribing the infamous test framed by the Scottish Parliament in 1681 was declared treasonable, and he was again condemned to death. The devotion of his wife enabled him to escape from Edinburgh Castle in the disguise of a page; and after remaining concealed some time, he fled to Holland. Landing in the north of Scotland, in May 1685, with an armed force, to co-operate in the revolt of Monmouth, he was, after a series of misfortunes, taken prisoner, hastily condemned, and beheaded, June 30, 1685. His son Archibald, one of the deputation sent by the Scottish Convention to present the crown to the Prince of Orange, was in 1701 created Duke of Argyle.

ARGYLE, John Campbell, 2d Duke of, son of the first duke, was born in 1678, and took an important part in the political and military affairs of his time. As royal commissioner in 1705, he had a principal share in bringing about the Act of Union. As a soldier, he distinguished himself under Marlborough at Ramilies, Oudenarde, Lille, Ghent, and Malplaquet. Previous to the change of ministry in 1710, A. had been a keen Whig. He now veered with the wind of the court, and became a declaimer against the Duke of Marlborough. As the reward of his apostasy, he was appointed by the Tories generalissimo of the British army in Spain; but considering himself to have been unhandsomely treated by the ministry, he shortly after returned, and finding his influence greatly diminished, he again became a Whig. His career up to the rebellion of 1715, was most tortuous and unprincipled, and seriously detracts from his meritorious services during that critical period. He was, however, completely successful in quelling disturbances, and his services were rewarded in 1718, among other dignities, with an English peerage, and the title of Duke of Greenwich. His restless vanity and ambition, however, constantly prompted him to political intrigues. In 1721 he again played into the hands of the Tories, for the purpose of securing the entire patronage of Scotland. In 1737 he rose into immense popularity in his own country, by his spirited defence before parliament of the city of Edinburgh in regard to the Porteous mob. He died on the 3d September 1743. He was a man of lax principles and selfish character, but possessed of considerable shrewdness and talent, and noted for his kindness and courtesy in private life. The benevolence of his disposition procured him the title of "the Good Duke of Argyle.'

ARGY'LE, Duke of. George John Douglas Campbell, 8th Duke of A., was born in 1823, and succeeded his father in 1847. At the age of 19, his Grace, then Marquis of Lorne, wrote a pamphlet entitled *A Letter to the Peers from a Peer's Son*, on the subject of the struggle which ended in the disruption of the Scottish Church. Seven years later he published an essay on Presbytery, which contains a historical vindication of the Presbyterian system. On taking his seat in the House of Peers, he soon commanded the respect of that dignified assembly. On the formation of the coalition ministry by Lord Aberdeen, his Grace was invested with the office of Lord Privy Seal, which he continued to hold in Lord Palmerston's administration. In 1855, he became Postmaster-general. In Palmerston's next ministry, formed in 1859, he again successively held the same office. Mr. Gladstone appointed him Secretary of State for India in 1868, and again in 1880. He resigned office in 1881, disapproving the Irish Land Bill. In 1874 he had supported the abolition of patronage in the Church of Scotland. In 1854 he was chosen lord rector of the University of Glasgow; in 1855 presided at a meeting of the British Association in that city; and in 1861 was elected president of the Royal Society of Edinburgh. His Grace is hereditary master of the Queen's household in Scotland, chancellor of the University of St. Andrews, a trustee of the British Museum, also hereditary sheriff and Lord Lieutenant of Argyleshire. Besides numerous papers on zoology, geology, &c., he has written *The Reign of Law*, 1866; *Primeval Man*, 1869; and, in 1870, *A History of the Antiquities of Iona*. In 1844 he married the eldest daughter of the Duke of Sutherland (died 1878). His eldest son, the Marquis of Lorne, married the Princess Louise in 1871; and in 1878 was appointed Governor-general of Canada. In the ducal title, A. is now generally spelt Argyll. See Lorne in Am. Supp.

ARGY'LESHIRE (*Airer-Gaedhil*, territory of the Gael), a county in the west of Scotland, cut up into many peninsulas, by arms of the sea, and including numerous islands. It is bounded N. by Invernessshire; W. and S. by the sea; E. by Perthshire,

Dumbarton, Loch Long, and Firth of Clyde. Its greatest length is about 115 miles; greatest breadth about 60 miles; its extent of coast-line is very great, amounting to 663 miles, owing to the indentation of the coast by numerous lochs running inland. Next to Inverness, it is the largest county in Scotland—area, 3210 square miles, of which 1063 are occupied by the numerous islands. No part is above 12 miles from the sea or from large inland lochs. The county is divided into the districts of Cantire, North and South Argyle, Lorn, Appin, Cowal, Morven, and Sunart.

The chief islands are Mull, Islay, Jura, Tiree, Coll, Lismore, and Colonsay, with Iona and Staffa. There are upwards of thirty other islands of smaller size. The general aspect of A. is wild and picturesque, marked by rugged and lofty mountains and deep inland bays. Some fertile valleys exist. The north part is entirely mountainous, and presents some of the grandest scenery in Scotland, as Glencoe. The highest peaks are (Ord. Trig. Survey) Bidean nam Bian, 3766 feet; Ben Cruachan, 3693; Buachael Etive, 3341—all in Lorn; Ben Ina (end of Loch Long), 3319; Ben More (Mull), 3185; Ben Creach (Morven), 2790; North Pap of Jura, 2565. The chief bays are (going south)—Loch Moidart, Loch Sunart, Linnhe Loch, branching off into Loch Eil and Loch Leven, Loch Fyne, and Loch Long. There are no rivers of any size. The streams are short and rapid, the principal being the Urchay, running through Glenorchy into Loch Awe, and the Awe connecting that lake with Loch Etive. The inland or fresh-water lochs are Loch Awe and Loch Lydoch. The rocks of A. are mica-slate, which predominates on the mainland; trap in Mull and Lorn; quartz rock in Islay and Jura; granite around Loch Etive and in Knapdale; patches of lias and oolite in many of the isles; and a little old red sandstone west of Loch Fyne and in South Cantire. Lead-mines occur at Strontian (where the mineral Strontianite was discovered, and from which the names of the earth called *Strontia* and the metal *Strontium* are derived), at Tyndrum, and in Islay and Coll. A copper-mine exists in Islay. The Easdale and Ballachulish quarries supply the best roofing-slates in Scotland. Coal occurs near Campbelton; fine marble in Tiree, &c.; excellent granite near Inverary; and limestone in most parts of the county. The fertile parts of A. lie along the arms of the sea and the mountain streams. The soil is mostly a light, sandy, and gravelly loam, along the coast and the sides of the rivers, and gravelly, with a till bottom, on the hillsides. Sheep and cattle rearing are the chief occupations of the farmer. More sheep are reared in A. than in any other Scotch county, and nearly a million acres are in permanent pasture. In number of cattle, A. yields only to the counties of Aberdeen, Ayr, Lanark, and Perth. In 1881, A. had 24,481 acres under corn, and 12,990 under green crops, as well as 60,151 acres under permanent pasture, exclusive of heath or mountain-land. A. abounds in deer and game. Loch Fyne is famed for its herrings. Loch Awe abounds in salmon and trout.

In many parts of A. the peasantry are still very poor, notwithstanding that steamers now connect every portion of the coast with the commercial center of Scotland. The manufactures are unimportant, the chief being whisky, in Campbelton and Islay, and coarse woollens for home use. The chief towns and villages are Inveraray, Campbelton, Oban, Dunoon, Lochgilphead, Tarbert, and Tobermory. The three former unite with Ayr and Irvine in returning one member to parliament; the county returns another. Pop. (1871) 75,679; (1881) 76,440, mostly using the Gaelic language. This exhibits a considerable decrease since 1831, which has chiefly resulted from emigration. This extensive county is divided ecclesiastically into not more than fifty parishes, which contain only two royal burghs, Inverary and Campbeltown, the former of which is a station of the Circuit Court of Justiciary. The principal proprietors are the Duke of Argyle, the head, and the Earl of Breadalbane, a branch of the Campbell family. Among the antiquities of A. are the ruins of Iona and Oronsay, and many *duns*, or circular forts, along the coast. In Cantire formerly lived the Macdonalds, or Lords of the Isles, whose power was weakened by James III.

ARIA (Air), in Music, a rhythmical song, as distinct from recitative. The term was formerly applied to a measured lyrical piece either for one or several voices; but is now commonly applied to a song introduced in a cantata, oratorio, or opera, and intended for one voice supported by instruments. Arietta, a short melody. Arioso, a passage in the style of the A., often introduced into recitative. A. Buffo, a comic song, &c.

ARIA'DNE, daughter of Minos, king of Crete, by Pasiphaë. When Theseus, with the offerings of the Athenians for the Minotaur, landed in Crete, A. conceived a passion for the beautiful stranger, and gave him a clew by means of which he threaded the mazes of the labyrinth, and was enabled to slay the monster. For this service, Theseus promised to marry her, and she escaped with him, but was slain by Diana on the island of Naxos.—According to another tradition, A. was left by Theseus at Naxos, where she was found by Bacchus returning from his triumph in India, who was captivated by her beauty, and married her. At her death, he gave her a place among the gods, and suspended her wedding-crown as a constellation in the sky. A., as left forsaken by Theseus, and as married to Bacchus, has been a favorite subject with artists.

ARIA'LDUS, a deacon of the church of Milan, who flourished during the 11th c. He took a prominent part in the ecclesiastical contentions of his times. The Catholic Church in the north of Italy was then very corrupt, a wide-spread licentiousness, originating from the unnatural institution of priestly celibacy, prevailed. Great numbers of the clergy kept concubines openly. Such as looked earnestly in those days at this flagrant evil, were disposed to consider the strict enforcement of celibacy the only effectual cure. Chief among these reformers stood A., whose life was one continued scene of violent controversy. Although successively sanctioned by Popes Stephen X., Nicholas II., and Alexander II., he found little sympathy among his brethren, and used to complain that he could only get laymen to assist him in his agitation. Having at length succeeded in obtaining a papal bull of excommunication against the Archbishop of Milan, a fierce tumult ensued in the city, whose inhabitants declared against A. and his coadjutors. A. now fled to the country; but his hiding-place being betrayed, he was conveyed captive to a desert isle in Lake Maggiore, where he was murdered by the emissaries of the archbishop, and his remains thrown into the lake, June 28, 1066. He was afterward canonized by Pope Alexander II.

ARIA'NA. See Aryan Race.

A'RIANS. See Arius.

A'RIAS MONTA'NUS, Benedictus, a Catholic divine noted for his great linguistic attainments, was born, 1527, in the village of Frexenal de la Sierra, situated among the mountains separating Estremadura from Andalucia. He studied first at Seville, and afterwards at Alcalá de Henares, where he distinguished himself by the ardor he manifested in the acquisition of the oriental languages, Arabic, Syriac, and Chaldee. He next proceeded on a tour through Italy, France, Germany, England, and the Netherlands, in the course of which he obtained a knowledge of various modern tongues. He was present at the celebrated Council of Trent; but on his return to his own country, he resolved to retire into seclusion, and dedicate his whole time to literature. In 1568, however, Philip II. persuaded him to repair to Antwerp and superintend the publication of the famous edition of the 'Polyglot Bible,' executed in that city at the suggestion of the printer, Christopher Plantin. After four years' labor, the work was issued under the title *Biblia Sacra, Hebraice, Chaldaice, Græce, et Latine. Philippi II. Regis Catholici Pietate et Studio ad Sacrosanctæ Ecclesiæ Usum Chph. Plantinus excudebat.* It was received with universal applause. The Jesuits, to whom A. was sincerely and strenuously opposed, alone attempted to fasten the charge of heresy on the author, who made several journeys to Rome to clear himself of the accusation. Philip II. rewarded him with a pension of 2000 ducats, besides bestowing on him various emoluments. He died at Seville in 1598. His literary works are very numerous. They relate principally to the Bible and to Jewish antiquities; but he also wrote a poem on Rhetoric, and a History of Nature.

ARI'CA, a seaport of Moquega, the most southerly department of Peru, in lat. 18° 28′ S., and long. 70° 24′ W. Though it has merely a roadstead, it affords safe anchorage to shipping, and is one of the chief outlets of the trade of Bolivia, being connected with La Paz in that republic by a mule-path which leads across the west Cordillera of the Andes. Its exports mostly consist of copper, silver, alpaca, wool, and guano. A. has frequently suffered from earthquakes; a most destructive one occurred in 1868. It was stormed and taken by the Chilians in 1880, and afterwards set on fire. About 230 vessels, of some 260,000 tons, enter this port annually, and about the same number clear it with cargoes. The climate is salubrious. Pop. about 4000.

ARICHAT, a seaport of Cape Breton Island, in the province of Novia Scotia, with a harbor for the largest vessels. It is near the Gut of Canso, the most southerly of three channels of communication between the Gulf of St. Lawrence and the Atlantic. The town has about 1000 inhabitants, is largely engaged in fishing, and at the head of its harbor a lead mine has recently been opened.

ARIA'NO (*Arianum*), a city of South Italy, in the province of Avellino, beautifully situated 2800 feet above the sea, in one of the most frequented passes of the Apennines, 50 m. N.-E. from Naples. It is a bishop's seat, and has a fine cathedral. The chief manufacture is earthenware. There is a considerable export trade in wine and in butter. A. is said to have been founded by Diomed. Roger II. held a parliament here to settle the affairs of the province, after his defeat of the allied armies of Pope Innocent II. and the Prince of Capua. In the face of the hill on which the city is built, hundreds of caves have been dug, in which many of the poorer inhabitants dwell. Pop. 12,588.

ARIEGE, or ARRIEGE, a river in the south of France, rises in the department of the East Pyrenees, flows through a beautiful

vale. and falls into the Garonne near Toulouse.—The department of ARIEGE, which lies along the northern slopes of the Pyrenees, formed a part of the old county of Foix, the territory of Couserans, and the province of Languedoc, is bounded N. and W. by Haute Garonne, E. by Aude, S. by the republic of Andorra and the Pyrenees. It contains some of the highest mountain-summits in France, such as Fontargente, 9164 feet; Serrère, 9592 feet; Montcalm, 10,513 feet; Estats, 10,611 feet; Montvalier, 9120 feet. The department, nevertheless, has a mild climate. Area, 1880 square miles. Pop. (1881) 240,601, engaged chiefly in agriculture, pasturage, iron mines, and the manufacture of woollens, linen, pottery, &c. The three arrondissements are Foix, Pamiers, and St. Girons. Chief towns—Foix, Pamiers, St. Girons.

A'RIES, the Ram, one of the signs of the zodiac, including the first 30 degrees of the ecliptic measured from the vernal equinox, or that point where the vernal passage of the sun across the equator takes place. The vernal equinox, or, as it is also called, the first point of A., is constantly changing its position among the fixed stars, in consequence of the precession of the equinoxes, moving westward at the rate of 50″·2 annually. It is from this circumstance that the sign A. no longer corresponds with the constellation A., which was the case about 2000 years ago, when the ecliptic was divided into 12 equal parts called signs, each named after the group of stars through which it passed. The present sign A. is in the constellation Pisces, about 30° west of the original sign; and although the sun at the vernal equinox will always be at the first point of A., yet nearly 24,000 years will elapse before that point will again coincide with the beginning of the constellation A.

A'RIL (*arillus*), a peculiar covering of the seed in some plants, formed by an expansion of the *funiculus* (the cord which attaches the ovule to the *placenta*), or of the placenta itself. This expansion takes place after fertilization, and sometimes invests the seed entirely, sometimes only partially. In the nutmeg, the A. forms what is called *mace*. In the spindle-tree (*Euonymus Europæus*), it forms the remarkable orange-colored covering of the seed.

ARI'NOS, a river of Brazil, which after a north-west course of 700 miles, enters the Tapajos, itself an affluent of the Amazon, in lat. 9° 30′ S., and long. 58° 20′ W.

ARI'ON, a celebrated lute-player, a native of Methymna, in Lesbos, about 700 B.C., was regarded by the ancients as the inventor of the dithyrambic metre. According to a tradition first given by Herodotus, and afterwards decorated by the poets, A. was sent by Periander, ruler of Corinth, to Sicily and Italy, and at Tarantum won the prize in a poetical contest. As he returned laden with gifts in a Corinthian ship, the avaricious mariners determined to slay him and seize his wealth; of this the poet, musician was forewarned by Apollo in a dream. He asked for permission to try his skill in music; and after playing on his lute threw himself from the deck into the sea. Here several dolphins, charmed by his music, had assembled round the vessel. On the back of one of them the musician rode safely to the promontory of Tænarus, where he landed, and journeyed on to Corinth. The sailors who, arriving afterwards, assured Periander that A. was dead, were confronted with him, when they confessed their guilt, and were crucified. The lute and dolphin were raised among the constellations; and the story became a favorite theme with artists. A. W. Schlegel, in one of his best poems, gives this story of A.

ARIO'STO, LUDOVICO, one of the greatest of Italian poets, was born at Reggio, September 8, 1474, being the eldest son of the military governor of that city. He was bred to the law, but abandoned it for poetry. However, at an early period of life, he was compelled to exert himself for the support of a large family, left as a burden on him at the death of his father. His imaginative powers were developed in early life. In 1503, after he had written two comedies, with several lyrical poems in Latin and Italian, he was introduced to the court of the Cardinal Hippolytus d'Este, who employed him in many negotiations. Here, in Ferrara, in the space of about ten years, he produced his great poem *Orlando Furioso*, which was published in that city, in one volume 4to, in 1516, in forty cantos. After the death of the cardinal, the duke, his brother, invited the poet to his service, and acted to him with great kindness and liberality. In the early part of 1521, a second edition of his poems was published, the *Orlando Furioso* being still in forty cantos. Shortly after, he was commissioned by the duke to suppress an insurrection which had broken out in the wild mountain-district of Garfagnana; a task which seems more like a punishment than a mark of honor. A., however, succeeded in this arduous undertaking; and after remaining three years governor of the quarter, he returned to Ferrara, where he lived comfortably, nominally in the service of his patron, but in reality enjoying what he highly prized—an abundant leisure for prosecuting his studies.

It was at this time that he composed his comedies, and gave the finishing touch to his *Orlando*. At length, in the latter part of 1532, that poem made its appearance in a third edition, enlarged to its present dimensions of forty-six cantos. He now became seriously ill of a painful internal distemper, of which, after a few months of suffering, he died on the 6th of June 1533, in his fifty-ninth year, and was buried in the church of San Benedetto, at Ferrara, where a magnificent monument indicates the resting-place of his remains. A. is described as a man of noble personal appearance and amiable character. His *Orlando Furioso* is a romantic, imaginative epic, marked by great vivacity, playfulness of fancy, and ingenuity in the linking together of the several episodes. It takes its name and its theme from a chivalrous romantic poem by Boiardo, the *Orlando Innamorato*. That poem treats of the wars between Charlemagne and the Saracens, confounded as they were by tradition with those of Charles Martel, wherein Orlando, or Roland, stood forward as the champion of Christendom. Orlando is the hero of Boiardo's piece, and falls in love with Angelica, a clever and beautiful oriental princess, sent by the Paynim to sow discord among the knights of the Christian armies. The story of this lady being left unfinished in the *Orlando Innamorato* is taken up by A., who makes her fall in love herself with an obscure juvenile squire, on which Orlando gets furious, and long continues in a state of insanity. Besides his great work, A. wrote comedies, satires, sonnets, and a number of Latin poems, all more or less marked with the impress of his genius. In 1845, Giamperi, a librarian of Florence, announced that he had discovered at Argenta, near Ferrara, an autograph manuscript by A., containing a second epic, *Rinaldo Ardito*, describing, like the *Orlando*, the battles of Charlemagne and his paladins against the Saracens. The manuscript had been mutilated, and contained in a complete form only the cantos 3, 4, 5, while 2 and 6 were imperfect; and it was stated that the entire poem had consisted of twelve cantos. The work was published under the title *Rinaldo Ardito di L. Ariosto, Frammenti Inediti Pubblicati sul Manuscritto Originale* (Florence, 1846). In genius and style, it has been found by critics by no means to accord with the *Orlando*. Of the *Orlando* there are three several translations into the English language: the first, by Sir John Harrington, appeared in the year 1634; the second, by John Hoole, in 1783; and the third by W. Stewart Rose, in 1823 and following years. In the last only is there to be found a fair representation of the feeling and spirit of the original.

ARIOVI'STUS (probably the Latinized form of the German *Heer-fürst*, army-prince), a German chief, leader of the Marcomanni and other German tribes, was requested by the Sequani, a Gallic people, to assist them in a contest against the Ædui. Having gained a victory for the Sequani, A. was so well pleased with their fine country (now Burgundy), that he and his followers determined to abide there. Many other Germans followed him into Gaul, where he soon collected an army of 120,000 men. The Gallic people turned now for help towards the Romans, and Cæsar demanded an interview with A., who proudly replied, that 'he did not see what Cæsar had to do with Gaul.' After another message from Cæser had been treated in the same scornful manner, the Roman forces under Cæsar advanced and occupied Vesontium (now Besançon), the chief city of the Sequani. A furious engagement took place (58 B.C.) in which Roman discipline prevailed over the German forces, which were utterly routed. A., with only a few followers, escaped over the Rhine into his own country. His subsequent history is unknown.

ARI'SPE, a town in Sonora, the extreme north-west department of the Mexican Confederation. It is situated in the Sierra Madre, the western range of the Rocky Mountains, on the banks of the Sonora, which is said to lose itself in an inland lake. Its population has been estimated as high as 7600. The surrounding district abounds in the precious metals, as also in cotton, wine, grain and live-stock.

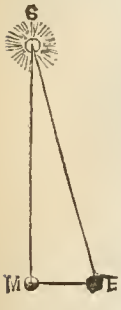
ARI'STA and ARI'STATE. See AWN.

ARISTAE'US (from a Greek word signifying *the best*), an ancient divinity whose worship in the earliest times was widely diffused throughout Greece, but whose myth is remarkably obscure. According to the common tradition, he was the son of Apollo and Cyrene, the latter the grand-daughter of Peneius, a river-god of Thessaly. She is said to have given birth to A. on the coasts of Libya, in Africa, whence the region is alleged to have derived its name of Cyrenaica. Hermes placed the child under the protection of the Horæ, the fosterers of cities, culture and education. According to another tradition, A. was the son of the nymph Melissa, who fed the infant with nectar and ambrosia, and afterwards intrusted his education to Chiron. The great diversities in the legend were probably caused by the fusion into one of separate local divinities, whose functions were similar, and whose histories were, in consequence, carelessly commingled. After A. left Libya, he went to Thebes, in Bœotia, where he was taught by the Muses the arts of healing and prophecy, and where he married Autonoë, the daughter of Cadmus, by whom he had several children. After the unfortunate death of his son Actæon (q. v.), he

went to Ceos, where he liberated the inhabitants from the miseries of a destructive drought by erecting an altar to Zeus *Icmæus*—i. e., the rain-maker. He now returned to his native land; but shortly after, set out a second time on a voyage of beneficence. He visited the islands of the Ægean Sea, Sicily, Sardinia, and Magna Græcia, leaving everywhere traces of his divine benignity. At last he went to Thrace, where he was initiated in the mysteries of Dionysus; and after a brief residence in the vicinity of Mount Hæmus, he disappeared from the earth.

This myth is one of an extremely pleasing character, from the invariable beneficence which is attributed to A. It is less disfigured by anthropopathic errors than most of the myths of Greek divinities. A. was especially worshiped as the protector of vine and olive plantations, and of hunters and herdsmen. He also trained men to keep bee-hives, and averted the burning heats of the sun from the open fields. Later mythology often identified A. with the higher gods Zeus, Apollo, Dionysus.

ARISTA'RCHUS, OF SAMOS, a celebrated ancient astronomer, of the Alexandrian school, who flourished 281—264 B. C. All his writings have perished, excepting a short essay on the sizes and distances of the sun and the moon. In this he shows the method of estimating the relative distances of the sun and the moon from the earth, by the angle formed by the two bodies at the observer's eye at that moment when the moon is exactly half-luminous. It will be obvious from a glance at the annexed figure that the three bodies must then form a right-angled triangle, of which the moon is at the right angle. The angle MES, then, being observed, it is easy to find the ratio between EM and ES. This is quite correct in theory; but the impossibility of determining when the moon is exactly half-illuminated, renders the method useless in practice. Besides, in the days of A., there were no instruments for measuring angles with anything like accuracy. A. estimated the angle at E at 83°, and determined EM to be $\frac{1}{20}$ of ES; the truth being that the angle at E differs only by a fraction of a minute from a right angle, and that EM, the distance of the moon from the earth, is about $\frac{1}{400}$ of ES, the distance of the sun. According to some accounts, A. held, with the Pythagorean school, that the earth moves round the sun; but this seems to be a mistake. Vitruvius speaks of A. as the inventor of a kind of concave sun-dial.



ARISTA'RCHUS, OF SAMOTHRACE, a grammarian, who lived, about 150 B.C., in Alexandria, where he founded a school of grammar and criticism, and educated the children of Ptolemy Philopator. His life was chiefly devoted to the elucidation and restoration of the text of the Greek poets, especially of Homer. The form in which we now have the Homeric poems preserved is in a great measure owing to his judgment and industry. The strictness of his critical principles has made his name a general term for a severely just and judicious critic. Being afflicted with an incurable dropsy, he ended his life by voluntary starvation at the age of 72. The fragments of his writings that have been preserved are to be found scattered through the Scholia on Homer, first published by Villoison (Venice, 1788.)

ARI'STEAS, an entirely fabulous character, who may be styled 'the Wandering Jew' of popular tradition in ancient Greece. First we find A. teaching Homer; then, some ages afterwards, born at Proconnesus, an island in the Sea of Marmora. It is stated that having visited the Arimaspæ, the gold-watching Griffin, and the Hyperboreans, he died on his return home; but soon afterwards, a traveler asserted that he had been met and accosted by A. Consequently, neighbors searched the house where the body of A. was supposed to be lying, but it could not be found. Seven years afterwards, he appeared as an author, and wrote a poem entitled *Arimaspeia*, in three books, giving accounts of Northern and Central Asia, which were copied by Herodotus and others. After thus establishing himself as a poet, he vanished again; and after 340 years of mystery, reappeared at Metapontum, in the south of Italy, where he advised the people to erect an altar to Apollo, and an altar to the 'everlasting A.,' assuring them that, when Apollo founded their city, he (A.), in the form of a raven had accompanied the god, and had assisted in the ceremony. In the early controversy of the Christian Church, heathens sometimes quoted this tale of A. as a counterpart to the miracles recorded in the New Testament.

ARISTI'DES, surnamed 'THE JUST,' was the son of Lysimachus, and descended from one of the best families in Athens. He was one of the ten leaders of the Athenians against the Persians at the battle of Marathon (490 B.C.). It had been arranged that each leader (or *strategos*) should hold the supreme command for one day; but A., who saw the folly of this want of unity, induced his companions to give up their claims, and make Miltiades commander-in-chief, which proved the means of winning the battle. In the following year, A. was chief archon, and in this position, as in every other, secured the general respect of the citizens. Some years later, probably because he had opposed the plans of Themistocles, that unscrupulous leader brought about the banishment of A. It is said when an illiterate citizen, who did not know him personally, requested him to write his own name on the voting shell, he asked the man whether A. had injured him. 'No,' said the voter; 'but I am weary of hearing him always styled "the Just."' A. submitted to the sentence with dignity, praying to the gods, as he left the city, that the Athenians might not have cause to repent of their decision. Only three years later, Xerxes, with an overwhelming force, had invaded Greece. A., hearing that the Greek fleet was surrounded by that of the Persians, hastened from Ægina to apprise Themistocles of the danger and offer his aid. After taking a prominent part in the battle of Salamis, A. was restored to popular favor, and soon afterwards aided greatly in achieving the victory at Platæa, in which he commanded the Athenians. In 477 B.C. he introduced a change of the constitution, by which all citizens, without distinction of rank, were admitted to political offices. As showing the confidence reposed in A., it is related that Themistocles having announced that he had a scheme very advantageous for Athens, but which he could not disclose in a public assembly, A. was deputed to consult with Themistocles on the subject. The plan was to secure the naval supremacy of Athens by burning all the vessels of the other Greek states, her allies, then lying in a neighboring harbor. A. reported to the people that nothing could be more advantageous than the plan of Themistocles, but nothing could be more unjust; and the matter was immediately rejected by the people. After a variety of other public services, A. died in old age, and universally respected, 468 B.C., so poor that it is said his funeral had to be provided for by the public. He left a son and two daughters, for whom provision was made by state bounty.

ARISTI'PPUS, the founder of the Cyrenaic school of philosophy among the Greeks, was the son of Aritades, a wealthy gentleman of Cyrene, in Africa, and was born in that city about the year 424 B.C. Having come over to Greece to attend the Olympic games, he heard so much of Socrates, that he was filled with an eager desire to see the sage, and hurried to Athens, where he became one of his pupils. He remained with Socrates up nearly to the last moments of the great teacher, though he does not at any period seem to have followed his doctrine or practice. We know that subsequently he was the object of strong dislike, both to Plato and to Antisthenes the Stoic. He passed a considerable part of his life in Syracuse, at the court of Dionysius, the tyrant, where he acquired the reputation of a philosophic voluptuary. That his manners must have been at once extremely graceful and accommodating, is clear from the saying of his opponent, Plato, who declared that 'A. was the only man he knew who could wear with equal grace both fine clothes and rags.' Diogenes Laertius records a number of his *dicta*, some of which take the form of *bons-mots*, and indicate a sharp, cutting, lively, and self-complacent nature. A. also lived at Corinth, in intimacy with the famous courtesan Laïs, but towards the close of his life he is supposed to have retired to Cyrene. His daughter Arete seems to have been a person of superior abilities, inasmuch as her father imparted his leading doctrines to her, and she to her son, A. the Younger (hence called *Metrodidaktos*, 'taught by the mother'), by whom they are supposed to have been systematized. A., in all probability, published nothing during his life. He prided himself more upon spending his days in what he conceived to be a philosophical manner, than in elaborating a philosophical system for the benefit of the race.

The Cyrenaic school, all the teachers of which were probably imbued with the spirit of A., and merely carried out his doctrines to their legitimate results, professed a great contempt for speculative philosophy, and for physical and mathematical knowledge. They confined their investigations to morals, and formed an ethical system completely in harmony with the gay, self-possessed, worldly, and sceptical character of their master. The chief points of the Cyrenaic systems were: 1. That all human sensations are either pleasurable or painful, and that pleasure and pain are the only criterions of good and bad. 2. That pleasure consists in a gentle, and pain in a violent motion of the soul. 3. That happiness is simply the result of a continuous series of pleasurable sensations. 4. That actions are in themselves morally indifferent, and that men are concerned only with their results. Wieland in his historico-philosophical romance, *Aristipp und einige seiner Zeitgenossen* (A. and Some of his Contemporaries), presents us with a charming picture of the life and opinions of the great philosophic sensualist, who stood out in strong relief against the gloom and austerity of Antisthenes and the Cynical school. See Wendt's *De Philosophiâ Cyrenaicâ* (Gött. 1842).

ARISTOBU'LUS, an Alexandrian Jew who lived under Ptolemæus Philometer about 175 B.C., and was considered by the early Fathers as the founder of the Jewish philosophy in Alexandria. He was long considered the author of the *Exegetical Commentaries*

on the Books of Moses which went under his name, but it is now admitted that the work in question was the composition of a later period. Only fragments of it remain. It was intended to show that the oldest Greek writers borrowed from the Hebrew Scriptures; and to support this theory, numerous quotations were professedly taken from Linus, Musæus, Orpheus, &c., of which the Christian apologists made abundant use. These, however have long been considered forgeries, inasmuch as they do not exhibit a trace of the antique Greek spirit, but make the writers speak in the tone and style of the Old Testament. See Valckenær's treatise, *De Aristobulo Judæo* (Leyden, 1806).

ARISTO'CRACY (Gr. *aristocratia*, from *aristos*, best, and *kratos*, power) means etymologically the power of government of the best, noblest, or most worthy; and in the sense which it originally bore, A. had reference not to a social class, but to a form of government in which the sovereignty was placed in the hands of a minority of the citizens of the state, exclusive altogether of the slave population, which generally existed in antiquity. It is in this sense also that we use it when we speak of the Italian states of the middle ages as aristocracies. In order to constitute an A., it was further necessary that the minority which composed it should consist of the highest class, in point not of wealth alone, but of birth and culture; the government of a minority in numbers simply, being known by the more odious name of an *oligarchy*. Were the whole government of England intrusted to the House of Lords, even though that body were to become vastly more numerous than it is, so long as it did not include half of the whole adult males, and were not elective, but hereditary, we should be ruled by an A., and our rulers would be aristocrats in the antique sense of the term. In this, its political sense, the term A. has never been acclimatized in England, because the thing which it signifies has always been unknown. Our territorial nobility, though possessing great influence in the government of the country, has, at every stage of its career, been controlled either by the Crown from above or the Commons from below; and thus it is that, though more important as a social influence than in any other country, the English A. has never assumed the form of a ruling-class.

When used with reference to English society, the term A. has two significations—a narrower and a wider one. According to the first, it is nearly synonymous with *nobility*. In this sense, it will be treated of under that head, and its relative subdivisions. According to the second, it is synonymous with *gentry*, and includes the whole body of the people, titled and untitled, above a certain very indefinite social line. Perhaps the nearest approximation which we shall make to a definition of A. in this, its proper English sense, will be by adopting that which Aristotle has given not of *aristocratia*, but of *eugeneia*, or good birth. 'Good birth,' he says, 'is ancient (long inherited) wealth and virtue.' (*Politic.* lib. iv. c. 7.) The question as to the extent to which either of these qualities is requisite to constitute a claim to admission into the ranks of the A., is one to which probably not two persons, either within or without the pale, would return the same answer; but that the absence of either would be a ground of exclusion, is a point on which there will be little difference of opinion. No amount of mere wealth will, in general, confer it either on a tradesman or his immediate descendants (see GENTLEMAN); and scarcely any deeds, however noble, will give it to him who is not the possessor of inherited fortune. Neither Burns the gauger, nor Shaw the lifeguardsman, has ever been regarded as an aristocrat, though nobody denies that the one was a poet, and the other a hero. But when the claim to recognition as an aristocrat has been inherited, it will scarcely be lost by the individual himself, however adverse may be his worldly circumstances, or however ignoble his conduct; and it is not difficult to imagine an elevation of moral tone which would confer it even on a beggar.

ARISTOGEI'TON, See HARMODIUS AND ARISTOGEITON.

ARISTOLO'CHIA, a genus of plants of the natural order *Aristolochiaceæ* or *Asarineæ*. This order, which is dicotyledonous or exogenous, consists of herbaceous plants or shrubs, often climbing shrubs, and contains upwards of 130 known species, chiefly natives of warm climates, and particularly abundant in the tropical regions of South America. The leaves are alternate, simple, stalked, often with a stipule; the flowers axillary, solitary, hermaphrodite, of a dull color; the perianth at its base adhering to the ovary, tubular, sometimes regular, but generally irregular; the stamens 6—12 epigynous (or inserted upon the ovary), distinct, or adhering to the style; the ovary is generally six-celled, with numerous ovulus; the style simple, the stigmas radiating, as numerous as the cells of the ovary; the fruit dry or succulent; the seeds with a very minute embryo at the base of fleshy albumen.

The genus *A.* is distinguished by a tubular oblique perianth, generally inflated at the base, the mouth dilated on one side, and by stamens adherent to the style, so that it is included in the Linnæan class *Gynandria*. The species are mostly shrubby, and natives of tropical countries, some of them climbing to the summits of the loftiest trees. Several are found in the south of Europe; one only, the common BIRTHWORT (*A. Clematitis*), occurs upon the continent as far north as about lat. 50°, and is a doubtful native of England. It is a perennial plant, with erect, naked, striated stem—heart-shaped dark-green leaves on long stalks—the flowers stalked, and growing to the number of sometimes seven together from the axils of the leaves, the tube of the perianth about an inch long, and of a dirty yellow color. It grows chiefly in vineyards, hedges, about the borders of fields, among rubbish, and in waste places. It has a long branching root, with an unpleasant taste and smell, which, with the root of *A. rotunda* and *A. longa*, two herbaceous species, natives of the south of Europe, was formerly much used in medicine, being regarded as of great service in cases of difficult parturition, whence the English name. These roots possess powerful stimulating properties, and those of the southern species are still used as emmenagogues. The root of *A. Indica* is used in the same way by the Hindoos.—*A. serpentaria*, VIRGINIAN SNAKEROOT, is a native of most parts of the United States, growing in woods. It has a flexuous stem, 8—10 inches high, bearing heart-shaped very acute leaves. The flowers are on stalks, which rise from the root; the orifice of the perianth is triangular. The root has a penetrating resinous smell, and a pungent, bitter taste. It has long been a fancied remedy for the bite of the rattlesnake. It possesses stimulant and tonic properties. It forms an article of export from the United States to Europe, and bears a high price, being highly esteemed as a medicine in certain kinds of fever.—Its reputation as a cure for serpent-bites is shared by other species, particularly *A. anguicida* and *A. guaeo* (the Guaco of Colombia), natives of the warmer parts of America.

Aristolochia Clematitis.

The juice has certainly the power of stupifying, and even of killing serpents; and it is said that a number of species are used by Egyptian jugglers, in order to their handling serpents with impunity.—Several South American species seem also to possess medicinal properties analogous to those of the Virginian snakeroot.—*A. Sipho*, a climbing shrub, of 15—20 feet in height, a native of the southern parts of the Alleghany Mountains, is frequently planted in the United States, in Britain, and on the continent of Europe, to form shady bowers. It has very large heart-shaped leaves (a foot in breadth), of a beautiful green. The flowers hang singly, or in pairs, on long stalks; the tube of the perianth is crooked in its upper part, inflated at the base, and veined with reddish-brown veins having a sort of resemblance to the bowl of a tobacco-pipe, for which reason the shrub is sometimes called Pipe-shrub, Pipe-vine, or Dutchman's Pipe.—The tropical species are distinguished for their beauty and the peculiar forms of their flowers. Some of them are much prized ornaments of our hot-houses.

Aristolochia serpentaria; *a*, a flower; *b*, a flower not open, showing the parts of fructification, *c*; *d*, the stamens; *e*, the stigmas.

To the natural order *Aristolochiaceæ* belongs also the genus ASARUM.

ARISTO'PHANES, the only writer of the old Greek comedy of whom we possess any entire works, was the son of one Philippus, and was born at Athens about the year 444 B.C. We know very little of his history. Plato, in his *Symposium*, relates that he was fond of pleasure—a statement which it is easy to credit when we consider the tendencies of his profession in all ages. It seems equally clear, however, from the vigorous and consistent expression of his convictions in his various works, and from the fearless manner in which he assails the political vices of his day, that he was possessed of an honest and independent spirit. He appeared as a comic writer in the fourth year of the Peloponnesian war (427 B.C.).

The piece which he produced was entitled *Daitaleis* (the Banqueters), and received the second prize. It ridiculed the follies of extravagance, and, like all his subsequent works, was pervaded by a contempt of modern life, and an admiration of the sentiments

and manners of the earlier generations. Next year, he wrote the *Babylonians*, in which he satirized Cleon, the so-called demagogue, so sharply, that the latter endeavored to deprive him of the rights of citizenship, by insinuating that he was not a real Athenian. This, in all probality, gave rise to the various traditions of A. having been born in Rhodes, Egypt, &c. Fragments of these plays remain. In 425, his *Acharnians* obtained the first prize. It was written to expose the madness of the war then raging between Athens and Sparta, and exhibits the feelings of the 'peace-party' in the former city. It is still extant. In 424 appeared *Hippeis*, the *Knights* or *Horsemen*. It was the first which the poet produced in his own name, and evinces the singular boldness of the author. It is levelled against Cleon, and presents us with a striking picture both of a vulgar and insolent charlatan, and of the fickle, cunning, credulous, and rather stupid mob over whom he precariously despotises. It is related of this piece that, when no actor would undertake to play the part of the influential Cleon, A. himself impersonated the demagogue. Unfortunately for the character of Cleon, as well as that of the Athenian democracy, these caricatures and misrepresentations of A. have been received as historical pictures. How far they are from the truth, has been clearly shown by Grote in his *History of Greece*. See CLEON. In 423, A. produced the *Clouds*, which, along with the *Knights*, are the two most famous of his comedies. They exhibit in overflowing richness that fancy, wit, humor, satire, and shrewd insight which characterize this greatest of all Greek comic writers. The *Clouds*, however, displays at the same time the weaknesses and imitations of A.'s mind. Its aim was to deride the pretensions of the new sophistical school, and to point out its pernicious tendencies. So far well. But A., who was no philosopher, demonstrates his own incapacity to appreciate the highest range of thought and character, by selecting no less a person than Socrates as the most perfect representative of a sophist. A., who was both religiously and politically conservative, had apparently no clearer conception of abstract truth than is involved in reverence for the sanctities of the past, the old gods, old traditions, old manners, and old sentiments. He had an instinctive hatred of innovations, and considered all equally pernicious. As he had represented Cleon the reformer as a vulgar innovator and demagogue, ruled by the lowest considerations, he makes the innovating views of Socrates also proceed from corrupt motives, veiled perhaps with more craft. Alcibiades is caricatured in this brilliant comedy as a wildly extravagant youth, whose career of ruin is accelerated by the insidious instructions of Socrates; and a hint is thrown out towards the end of the piece, which unfortunately proved to be the 'shadow' of a 'coming event.'

A. represents the father of Alcibiades as about to burn the philosopher and his whole *phrontisterion* (subtlety-shop); and there can be little doubt that this dramatic vilification of the purest of heathen moralists led to that persecution which, twenty years later, culminated in his condemnation and death. In 422 appeared the *Wasps*, still extant, in which the popular courts of justice are attacked; and three years later, in his *Peace*, he returns to the subject of the Peloponnesian war, which is ridiculed with great cleverness. In 414 he produced two comedies, *Amphiaraus* and the *Birds*, both of which caricature, in the liveliest manner, the Sicilian expedition, then being meditated, but which proved so utter a failure. The *Lysistrata* belongs to the year 411, and exhibits a civil war of the sexes, as the monstrous issue of that in the Peloponnesus. In his *Platus* and *Ecclesiazusæ*, which respectively appeared in 408 and 392, true to his mission as the enemy of innvoation, he assailed the new passion for Doric manners and institutions, and ventured to ridicule Plato, in that, however, in which the philosopher is weakest—namely, his political theory. Euripides, also, as the sophist among poets, is severely handled in the *Frogs*, which belongs to the year 405.

A. wrote fifty-four comedies, of which only eleven are extant. He is acknowledged to stand far above all his contemporaries or successors of the middle and new comedy in wealth of fancy and beauty of language. His choruses sometimes exhibit the purest spirit of poetry; and Plato himself says that the soul of A. was a temple for the Graces. The ingenuity which he displays in the mechanical artifices of verse is not less wonderful. Frogs are made to croak choruses, pigs to grunt through a series of iambics, and words are coined of amazing length—the *Ecclesiazusæ* closes with one composed of 170 letters. It only remains to be added, what might naturally be expected, that the personalities in which A. indulged descend at times into coarseness and indecency, and that even the gods whom he undertook to defend are treated with levity, and placed in the most ludicrous lights.

The comedies of A. have been edited by Brunck (1781—1783), Dindorf (1794—1826), Bekker (1829). They have all been translated into German by Voss (Brunswick, 1821), and there are several translations of single plays into English.

ARISTOTE'LIA. See MAQUI.

A'RISTOTLE was born at the Grecian colonial town of Stageira, on the west side of the Strymonic Gulf (now the Gulf of Contessa, in Turkey in Europe), in the year 384 B.C. He belonged to a family in which the practice of physic was hereditary. His father, Nikomachus, was the friend and physician of Amyntas II., king of Macedonia, father of Philip, and grandfather of Alexander the Great. A. lost both parents while he was quite young, and was brought up under the care of Proxenus, a citizen of Atarneus, in Asia Minor, who was then settled at Stageira. It is to be conjectured that his education, such as it was, would take the direction of preparing him for the family profession, and that whatever knowledge and power of manipulation attached to the practice of physic at that time, would rank among his early acquisitions. In after-life, he occupied himself largely in the dissecting of animals, and was acquainted with all the facts that had been derived from this source by others before him. It seems probable, however, that he early abandoned the intention of following physic as a profession, and aspired to that cultivation of universal knowledge for its own sake, in which he attained a distinction without parallel in the history of the human race.

In his 18th year (367 B.C.) he left Stageira for Athens, then the intellectual center of Greece and of the civilized world. Plato, on whom he doubtless had his eye as his chief instructor, was then absent at Syracuse in that extraordinary episode of his life, connecting him as political adviser with the two successive Syracusan despots—Dionysius the Elder, and Dionysius the Younger—and with Dion. A., therefore, pursued his studies by books, and by the help of any other masters he could find, during the first three years of his stay. On the return of Plato, he became his pupil, and soon made his master aware of the remarkable penetration and reach of his intellect. The expressions said to have been used by Plato imply as much; for we are told that he spoke of A. as the 'Intellect of the School.' Unfortunately, there is a total absence of particulars or precise information as to the early studies of the rising philosopher. He remained at Athens twenty years, during which the only facts recorded, in addition to his studying with Plato, are, that he set up a class of rhetoric, and that in so doing, he became the rival of the celebrated orator and rhetorical teacher, Isocrates, whom he appears to have attacked with great severity. It was in the schools of rhetoric that the young men of Athens got the principal part of their education for public life. They learned the art of speaking before the Dikasteries, or courts of law, and the public assembly, with efficiency and elegance; and incidentally acquired the notions of law and public policy that regulated the management of affairs at the time. We can easily suppose that A. would look with contempt upon the shallowness—in all that regarded thought or subject matter—of the common rhetorical teaching, of which, doubtless, the prevailing excellence would lie in the form of the address, being artistic rather than profound or erudite. One of the disciples of Isocrates, defending his master against A., wrote a treatise wherein allusion is made to a work (now lost) on proverbs, the first recorded publication of the philosopher.

The death of Plato (347 B.C.) was the occasion of A.'s departure from Athens. It was not extraordinary or unreasonable that A. should hope to succeed his master as the chief of his school, named the Academy. We now know that no other man then existing had an equal title to that pre-eminence. Plato, however, left his nephew Spensippus as his successor. We may suppose the disappointment thus arising to have been the principal circumstance that determined A. to stay no longer in Athens; but there are also other reasons that may be assigned, arising out of his relations with the Macedonian royal family at a time when the Athenians and Philip had come into open enmity.

Whatever may be the explanation, he went in his thirty-seventh year, after a stay of nearly twenty years in Athens, to the Mysian town of Atarneus, in Asia Minor, opposite to the island of Lesbos. Here he lived with Hermeias, the chief of the town, a man of singular energy and ability, who had conquered his dominion for himself from the Persians, at that time masters of nearly all Asia Minor. A. had taught him rhetoric at Athens, and he became in return the attached friend and admirer of his teacher. For three years the two lived together in the stronghold of Atarneus; but by treachery and false promises, the Rhodian Mentor, an officer in the Persian service, got possession of the person of Hermeias, put him to death, and became master of all the places held by him. A. accordingly fled, and took refuge in Mitylene, the chief city of the neighboring island of Lesbos. He also took with him Pythias, the sister of Hermeias, and made her his wife. In a noble ode, he has commemorated the merits of his friend thus lost to him through the treachery of a Greek renegade. His wife, Pythias, died a few years afterwards in Macedonia, leaving him a daughter of the same name. His son Nikomachus, to whom he dedicated his chief work on ethics—called, in consequence, the *Nikomachean Ethics*—was born to him at a later period of his life by a concubine.

After two years' stay at Mitylene, he was invited (in the year

342 B.C., age 42) by Philip to Macedonia, to educate his son Alexander, then in his fourteenth year. What course of study Alexander was made to go through, we cannot state. He enjoyed the teaching of A. for at least three years, and contracted a strong attachment to his preceptor, which events afterwards converted into bitter enmity. The two parted finally when Alexander commenced his expedition into Asia (334 B.C.), and A. came from Macedonia to Athens, having recommended to the future conqueror, as a companion in his campaigns, the philosopher Callisthenes, whom he educated along with Alexander. Now at the age of fifty, he entered on the final epoch of his life; he opened a school called the 'Lyceum,' from its proximity to the temple of Apollo Lyceius. From his practice of walking up and down in the garden during his lectures, arose the other name of his school and sect, the *Peripatetic*. It would appear to have been his habit to give a morning lecture to select pupils on the more abstruse subjects, and one in the evening of a more popular kind to a general audience. He may now be supposed to have composed his principal writings; but, unfortunately, there is nothing known of the dates of any of them. This crowning period of his life lasted twelve years. After the death of Alexander, the anti-Macedonian party at Athens obtained an ascendency, and among other consequences, an accusation was prepared against A., the pretext being impiety. With the fate of Socrates before his eyes, he chose a timely escape, and in the beginning of 322 B.C., took refuge at Chalcis in Eubœa, where, in the autumn of the same year, he died, aged 62. He had long been afflicted with indigestion, and ultimately sank under this malady.

The *philosophy* of A. differed from that of Plato on many points, especially in the fundamental doctrine termed the Theory of Ideas. The Platonic 'ideas' or 'forms' were conceived as real existences, imparting all that is common to the particular facts or realities, instead of being derived from them by an operation of the mind. Thus, the actual circles of nature derive their mathematical properties from the pre-existing 'idea,' or circle in the abstract; the actual men owe their sameness to the ideal man. A. was opposed to this doctrine throughout, although he always speaks of its author with respect, and sometimes with affection. The whole method of A. was in marked contrast to the Platonic handling of philosophical subjects: he was a most assiduous observer and collector of facts, from which he drew inductions with more or less accuracy. Plato, on the other hand, valued facts merely in criticising the views that he was bent upon demolishing, and not as a means of establishing sound theories.

The writings of A. may be said to have embraced the whole circle of the knowledge of his time. Many of them are lost; those that remain refer principally to the following departments.

Astronomy, Mechanics, Physics, were treated of by him at some length; but here his failure was complete, if we look at his writings from the point of view now acquired. He was the victim of capricious fancies, based upon doctrines common among his contemporaries, accepted by him as principles of reasoning, and conducting him to the most unsound conclusions. His theory of the rotation of the sphere, the necessary perfection of circular motion, of the impossibility of a vacuum, and the like, did more to confuse than to explain the phenomena of nature. Nor can it be said that the time was not ripe for putting these subjects on a rational basis; for he was very shortly followed by a series of men, who both observed and reasoned soundly respecting them, and laid the foundation of their great subsequent progress—namely, Euclid, Appollonius, Archimedes, Eratosthenes, and Hipparchus.

The thirteen books called Metaphysics contain much profound thought, but are obscure and defectively arranged; indeed, neither the actual arrangement of the books, nor the title which they bear, can be ascribed to A. himself. The subject to which they are devoted is Ontology—the science of *Ens, quatenus Ens*—which he terms *Philosophia Prima*, and sometimes Theology. He distinguishes three branches of theoretical philosophy. 1. Physics—the study of sensible material particular things, each of which differs from every other, and all of which have in themselves the principle of change or motion. 2. Mathematics—that of geometrical and numerical entities, known by general definitions, susceptible neither of change nor of movement, capable of being considered and reasoned upon apart from matter, but not capable of existing apart from matter. 3. The First or Highest Philosophy—which studies the essences of things eternal, unchangeable, and apart from all that change, movement, and differentiation which material embodiment involves.

The Metaphysics, or First Philosophy, does in fact deal with the extreme abstractions or generalities of all sciences. It is a collection, partly of doubts and difficulties, partly of attempted solutions, upon these last refinements of the human mind. It includes many valuable comments on the philosophy of Plato and others anterior to or contemporary with A. The general terms and subtle distinctions which this treatise first brought to view, were highly prized throughout all the philosophy of the middle ages.

He appears in a very different light in his great work on Animals. He has here amassed a stock of genuine observations, and also introduced a method of classification which continues to this day as the most approved groundwork of zoological classification. In this work we see perhaps, in the most advantageous light, the two great qualities of his mind, rarely coupled in the same individual—the aptitude for observation, and logical method. The excellence shown in his various writings generally depends upon one or other of these qualities.

His Organon or Logic is his complete development of formal reasoning, and is the basis and nearly the whole substance of syllogistic or scholastic logic. This science he almost entirely created. Mr. Grote observes (*History of Greece*, part ii. chap. lxviii.) that 'what was begun by Socrates, and improved by Plato, was embodied as a part of a comprehensive system of formal logic by the genius of A.; a system which was not only of extraordinary value in reference to the processes and controversies of its time, but which also having become insensibly worked into the minds of instructed men, has contributed much to form what is correct in the habits of modern thinking. Though it has now been enlarged and recast by some modern authors (especially by Mr. John Stuart Mill in his admirable System of Logic) into a structure commensurate with the vast increase of knowledge and extension of positive method belonging to the present day—we must recollect that the distance between the best modern logic and that of A. is hardly so great as that between A. and those who preceded him by a century—Empedocles, Anaxagoras, and the Pythagoreans; and that the movement in advance of these latter commences with Socrates.'

A considerable portion of his writings relate to the Human Mind and Body. In one of these, a short treatise on Memory and Recollection, he gave the first statement of the laws of Association of Ideas.

His treatises on Rhetoric and Poetics were the earliest development of a Philosophy of Criticism, and still continue to be studied. The same remark is applicable to his elaborate disquisitions on Ethics.

Perhaps one of his greatest works is his Politics, based upon a collection made by himself of 158 different Constitutions of States; the collection itself being unhappily lost. Here we see the spirit of the inductive observer, which indeed is no less apparent in the works mentioned in the last paragraph. It is, however, a singular fact, that he gives no evidence of having read the historian Thucydides; and his only reference to Herodotus is on a point of natural history. Yet the narratives and descriptions contained in the works of both these writers are probably of as much value, and as much in point, in a Political Philosophy, as the very best observations made by himself.

The great current distinctions of Matter and Form, Substance and Quality, Actuality and Potentiality, are due to A. See Grote's *Aristotle*, 1872.

ARISTO'XENUS, of Tarentum, a pupil of Aristotle's, and one of the oldest writers upon music, flourished about 330 years B.C. He was extraordinarily active and versatile in his literary studies, and is said to have composed upwards of 450 treatises on music, history, and philosophy. On the death of Aristotle, he fully expected to be appointed his successor, and is said to have been deeply mortified when Theophrastus was preferred; but this statement is discredited by many. He founded a school of musicians, who were called after him, Aristoxeneans, and whose distinguishing characteristic was that they judged of the notes in the diatonic scale exclusively by the ear, while the Pythagoreans determined these mathematically. Except his *Elements of Harmony*, in three books, which we still possess, only a few fragments of his writings survive in later authors.

ARI'THMETIC is the science that treats of numbers (Gr. *arithmos*). It is sometimes divided into theoretical and practical; the former investigating the properties of numbers and their combinations, the latter applying the principles so established, in the form of rules, to actual calculations. Some restrict the term A. to this art of reckoning, assigning the investigation of the principles to analysis.

Among the ancient Greeks and Romans, A. made little progress, owing to their clumsy modes of notation. Few of their writings on the subject have come down to us; the most important are those of Euclid (7—10 B. of the *Elements*), Archimedes,, Diophantus, and Nicomachus. After the introduction of the decimal system and the Arabic or Hindu numerals (see NUMERALS), about the 11th c., A. began to assume a new form; but it was not till the 16th c. that the Double Rule of Three, or Compound Proportion, was discovered, and decimal fractions were introduced. The invention of Logarithms in the 17th c. is the last great step in advance that the art has made. Passing over the elementary operations of Addition, &c., the chief heads, such as FRACTIONS, DECIMALS, PROPORTION, LOGARITHMS, &c., will be noticed in their proper places.

ARITHME'TICAL MEAN is that number that lies equally distant between two others: thus, the A. M. between 11 and 17 is 14, which is found by taking half their sum.

ARITHME'TICAL PROGRESSION is a series of numbers that increase or diminish by a common difference, 7, 10, 13, 16, 19, 22; or 12, 10½, 9, 7½, 6. To find the sum of such a series, multiply the sum of the first and last terms by half the number of terms. The series of natural numbers, 1, 2, 3, 4, &c., form an A. P., of which the difference is 1.

ARITHME'TICAL SIGNS are arbitrary marks or symbols used to denote the operations to be performed on numbers, or the relations existing between them. *Ex. gr.*, $7 + 5$ indicates that 7 and 5 are to be *added* together; $7 - 5$, that 5 is to be *subtracted* from 7; 7^5 that 7 is to be raised to the fifth *power*; $7 + 5 = 15 - 3$, that when 7 and 5 are added together, the result is *equal* to the difference between 15 and 3. The same signs are also used in Algebra; and an enumeration and explanation of them may be found in almost any treatise on Arithmetic or Algebra.

A'RIUS, the celebrated founder of Arianism, was a native of Libya, and is generally supposed to have been born shortly after the middle of the 3d c. About the year 306 A. D., Alexandria was thrown into confusion by the violence of its religious disputes, and in these A. was largely mixed up. At first, he took part with Meletius, Bishop of Lycopolis, in Upper Egypt, a man who was strenuously opposed to certain notions of discipline entertained by Peter, Bishop of Alexandria; but afterwards he became reconciled to the latter, who made A. a deacon. The reconciliation however, was brief. A. once more took the part of Meletius, and was excommunicated by Peter in consequence; but the latter dying soon after, Achillas, his successor, restored A. to his office, and even advanced him to the dignity of a presbyter, 313 A. D. His new function required that he should interpret the Scriptures, and, as he possessed an abundance of natural gifts, united with great learning, it is not wonderful that his preaching should have become popular, and his peculiarities of opinion been vehemently embraced. The first time, however, that A. was brought into collision on a point of doctrine with his ecclesiastical superiors, was in 318 A.D. Alexander, Bishop of Alexandria, and successor of Achillas, having in a public assembly of clergy, while speaking of the Trinity, said that it contained one single essence, or indivisible unity of substance, A. alleged that such a conception was impossible to the human mind, and accused Alexander of Sabellianism—i. e., of destroying the distinction of persons. The dispute grew hot, and a conference which was held to settle it only embittered the disputants. In maintaining his ground, A. went beyond his first statement of the absolute distinctness of person between the Father and the Son; he maintained that the Son was not co-equal or co-eternal with the Father, but only the first and highest of all finite beings, created out of nothing by an act of God's free will, and that he ought not to be ranked with the Father.

A. was successful in securing the adherence of large numbers both of the clergy and laity in Egypt, Syria, and Asia Minor. In 321 a synod of bishops was held at Alexandria.

These deposed and excommunicated A., and active measures were taken to let this decision be known over all the Christian churches. Alexander himself wrote numerous letters (two of which are still extant), exhorting the bishops not to receive the 'heretic.' In consequence of these violent steps, the breach was widened between both parties. To escape persecution, A. retired to Palestine, where he wrote a letter to his friend Eusebius, who was Bishop of Nicomedeia, a city of Bithynia, and not far from Constantinople. Eusebius, one of the most influential Christians of his time, warmly sympathized with him; wrote in his behalf to Paulinus, Bishop of Tyre, and others; absolved him from the Alexandrian synod's excommunication; and in 323 convened another synod in Bithynia, which pronounced favorably on A. He even enlisted Constantine on the side of the latter, to this extent at least, that the half-pagan emperor addressed admonitions to both Alexander and A., assuring them that the point in dispute was a trifling one, and ought not to provoke a serious quarrel. While A. was residing at Nicomedeia, he wrote a theological work in verse and prose, called *Thaleia*, some fragments of which remain, and indicate an earnest and philosophic mind, but at the same time contain expressions which could not but pain a believer in the divinity of Christ. The *Thaleia* is said to have been sung by the Arian neophytes, who thus kindled the passions of their adversaries, and increased the virulence of the contest. The comedians, who were pagans, took advantage of the occasion to ridicule the Christian religion in the theaters. The officers of the emperor in several cities wished to repress this profane temerity, but the interferenee only created greater confusion.

It now became impossible for the emperor to remain neutral or indifferent, with safety to himself, or to the tranquillity of the empire. Hosius, Bishop of Corduba, whom he had appointed mediator betwixt Alexander and A., took part with the former, and reported unfavorably of A. The result was, that Constantine, in order, as he thought, to effect a final settlement of the question, convoked the memorable Council of Nicæa (Nice, q. v.), in Bithynia, 325 A.D. Three hundred and eighteen bishops from all parts of the Christian world, but especially from the east, were present, besides numbers of priests, deacons, and acolytes. A. boldly expounded and defended his opinions. He declared in the most unambiguous manner that the Son of God was created out of nothing; that he had not always existed; that he was not immutable or impeccable; that it was through his free will he remained good and holy; that if he had chosen, he could as easily have sinned as not; in a word, that he was a mere creature and work of the Deity. He further affirmed that the Son of God was not of the same substance with the Father; that he was not the 'Word' or 'Wisdom,' properly speaking; and that the Scriptures only attribute these names to him as they do to other created intelligences.

These propositions were listened to with great calmness by the bishops, but the inferior clergy, or at least a majority of them, manifested the most violent opposition. The document containing his confession of faith was torn to pieces before his face. Arguments, however, of a more rational kind were also employed. Alexander was ably seconded by the young deacon, Athanasius, the equal of A. in eloquence, and in the power of his logic. It was principally by the reasonings of Athanasius that the council was persuaded to define, in the most precise manner, the doctrine of the Godhead—viz., the absolute unity of the divine essence, and the absolute equality of the three persons. All the bishops subscribed it except two, Theonas of Marmarica, and Secundus of Ptolemais, who had the heroism (for it must be considered such) to follow the banished A. into Illyricum.

The emperor was even prevailed on to remove the latter to Gaul, though he alleges as his reason that he wished to deliver him from the machinations of his enemies. In the same year, another synod met at Jerusalem, which revoked the sentence of excommunication uttered against A. and his friends. Still the majority of the Christians of Alexandria clung to the doctrines of Athanasius, and resolutely resisted every effort to establish the new opinions among them. Disappointed in his expectations, A., in 336 A.D., proceeded to Constantinople, where he presented the emperor with another apparently orthodox confession of faith; whereupon orders were issued to Alexander, Bishop of Constantinople, to administer to Arius the holy communion on the Sunday following. This was considered a grand triumph by Eusebius and his friends, and when the day arrived, they escorted A., as a guard of honor, through the streets of the metropolis. When about to enter the temple in which it was intended that he should be received with solemn pomp, he retired a moment to relieve nature, but fainted, and died of a violent hemorrhage. His disciples declared that he had been poisoned, while the orthodox devoutly affirmed that God had answered the prayers of Alexander.

Slight as might appear the verbal difference between the two parties, the bitterness of the controversy was intense, and pervaded almost all departments of public and private life. Constantius having by the death of Constans (350) and conquest over Magnentius (353), gained dominion over the west, the Arian cause, which he favored, triumphed at the synod of Arelate or Arles (353) and at that of Milan (355). These victories, however, were more apparent than real. The Nicene doctrine had still strong support on its side, and was strictly maintained by the banished Athanasius and his friends, while the Antiniciæans, soon after their triumph, were divided into at least three parties. The old Arians, also styled Anomœoi, or Heterousians, asserted, in the boldest style, their doctrine of 'distinct substances.' The semi-Arians (a large majority in the Eastern Church) maintained the Homoiousian doctrine of similar substances. A third party held the same doctrine with some qualification. Morally, the victory was leaning to the side of the Nicæans. Julian the Apostate (361—363), in his hatred of the Christian religion, left all parties at liberty to contend as they pleased with one another, so that they did not interfere with his plans. Jovianus and his followers in the west, Valentinianus I., Gratianus, Valentinianus II, extended full toleration to both parties. Arianism, at last, was virtually abolished in the Roman empire, under Theodosius in the east (379—395), and Valentinianus II. in the west. Among the German nations, however, it continued to spread through missionary efforts. Bishop Ulfilas, the translator of the Bible into the Mæso-Gothic language, had been the means of converting the West Goths to Arian Christianity as early as 348; and they adhered to it until the synod of Toledo in 589. The East Goths, Vandals, Burgundians, the Suevi in Spain, and the Longobards also adopted Arianism; but in all these instances the Nicene doctrine ultimately prevailed, most slowly among the Longobards, who retained the Arian creed until 662. The Arian controversy has never excited any great interest in modern times, though in England it was revived for a time by the writing of the learned Dr. Samuel Clarke (1675—1729) and also by Whiston, who died in 1752. More re-

cently, a part of the Arian doctrine, the denial of 'the eternal sonship,' was broached in the Wesleyan Methodist Society by Dr. Adam Clarke and a few followers; but it was soon suppressed by the Conference. Pure Arianism can hardly now be said to exist. It has gradually lapsed into Unitarianism. See UNITARIANS.

ARIZO'NA, a territory of the United States, lying between 31° 90′ and 37° N. lat., and 109° and 115° W. long. It is bounded N. by Nevada and Utah, E. by New Mexico, S. by Mexico, W. by California. Area, 113,916 sq. m. The surface consists of elevated table-lands intersected by mountains and interspersed with valleys. Grazing lands cover three-fourths of the territory, but its chief wealth lies in its minerals. Pop. (1870) 9658; (1880) 40,441; capital, Prescott. A., formerly a part of New Mexico, was organized as a separate territory in 1863. See ARIZONA in AMERICAN SUPPLEMENT.

ARKA'NSAS, one of the larger states of the American Union, taking its name from the river A. Throughout its entire length, it occupies the right bank of the Mississippi, being separated by that stream, towards the east, from Tennessee and the N. half of Mississippi. Its boundaries to the S., W., and N. are purely arbitrary and conventional, and are best learned from a map. With a length of 240 miles, and an average breadth of about 225, the area of A. is 53,850 square miles, being nearly 3000 miles larger than England (without Wales). In 1870, out of 34,000,000 acres, only 1,860,000 were cultivated, very little more than $\frac{1}{17}$ of the whole. This area had increased to 3,595,000 in 1880. In 1879, the agricultural productions of the state, were 22,432,800 bushels of Indian corn, 1,384,000 of wheat, 1,603,120 of oats, 696,600 of potatoes, and 323,872,500 bales of cotton. Pop. (1820) 14,273; (1870) 484,471; (1880) 802,564, of whom 210,593 were colored, Indians, and Chinese. Though nominally colonized by the French in 1685, it was still virtually a wilderness, when purchased as a part of Louisiana by the United States in 1803. It was only in 1819 and 1836 respectively that it became first a territory, and then a state of the Union. The towns of A. are small, the principal being Little Rock, the seat of government, with 12,380 inhabitants, which is about four times as populous as any other of the principal towns, which are, Camden, Fort Smith, Pine Bluff, Helena, Hot Springs, and Princeton.

In climate and productions A. occupies, as it were, an intermediate position between the states of the west and those of the south. A. is rich in minerals, particularly in manganese, zinc, and gypsum. It also contains the principal varieties of coal—cannel, anthracite, and bituminous. It likewise possesses lead-ores, which are said to contain a large proportion of silver. The manufactures of the state are comparatively insignificant.

The internal improvements of A. consist in great measure of plank-roads and levees or embankments against the Mississippi. In 1880, there were about 500 miles of railway in A. The state, however, is comparatively independent of works of this description, penetrated as it is by so many navigable rivers—the A., the White River, the St. Francis, the Red River, the Washita, &c.

In 1880, the public indebtedness of A., contracted mainly in support of banks, amounted to 5,096,405 dollars, nearly half of it representing 'interest accrued and unpaid.' The taxation for the same year was 613,957 dollars, chiefly the result of a direct assessment on property of almost every description—lands, houses, furniture, horses, mules, cattle, stock-in-trade of all trades, gold watches, jewelery, &c.

The state legislature meets only once in two years. To the Lower House of Congress A., in the proportion of its population, sends four representatives; while, like every other state, it has two senators in the Upper House. See ARKANSAS in AM. SUPP.

ARKA'NSAS RIVER, next to the Missouri the largest affluent of the Mississippi. It is 2000 miles long, rising in the Rocky Mountains on the borders of Utah, and joining the 'Father of Waters' in lat. 33° 54′ N., and long. 91° 10′ W. Flowing generally through a level country, it presents but few obstacles to navigation. The principal difficulty is connected with its periodical rise and fall—the difference between season and season being not less than 25 feet. Notwithstanding this, however, the A. is practicable for steamboats, during nine months of the year, to a distance of 800 miles from its mouth. It divides the state which takes its name into nearly equal parts, varying in breadth within the limits of the same from 3 furlongs to half a mile. Its banks also, in its lower course, contain a good deal of stone-coal.

A'RKLOW, a seaport town in the south-east corner of Wicklow county, in lat. 43° 40′ N. and long. 4° 38′ W., at the mouth of the river Avoca, which is crossed here by a bridge of nineteen arches. It consists of an upper well-built town, and a lower, inhabited by fishermen. 200 boats are employed in the herring and oyster fishery. Near the town is Shelton Abbey, the seat of the Earl of Wicklow. Sand-banks unfit the harbor for ships of any size, and extensive sand-dunes exist on the adjacent coast. In 1798, a bloody encounter took place here between the royal troops and the United Irishmen. Pop. (1871) 5178.

ARK OF THE COVENANT, ARK OF THE TESTIMONY, or ARK OF JEHOVAH, one of the most important parts of the furniture of the tabernacle, which, by divine direction, the Israelites constructed in the wilderness, and afterwards of the temple built by Solomon at Jerusalem. A description of it is to be found in Exodus xxv., in the command given to Moses for its construction; and also in Exodus xxxvii., from which it appears it was a chest of shittim-wood (very generally supposed to be the wood of a species of acacia, but by some regarded more probably as that of the wild-olive), overlaid with gold within and without, two cubits and a half in length, one cubit and a half in breadth and in height—that is, according to the common estimate of the length of the cubit, 3 feet 9 inches in length, and 2 feet 3 inches in breadth and height—the lid being formed entirely of pure gold, with a crown or raised border of pure gold round about. Within the ark was deposited the 'testimony,' consisting of 'the two tables of the law,' i. e., the stone tablets upon which the ten commandments were inscribed. The golden lid of the ark was called the *mercy-seat* or *propitiatory*, and above it were the *cherubims* (q. v.), made of the same piece of gold with it, and between them was the place of the *Shechinah* or manifestation of the Divine presence.

The ark had also golden rings, through which passed staves of shittim-wood, overlaid with gold, for carrying it in the journeyings of the Israelites, concerning which very particular rules were laid down (see Numbers, iv.). Whilst being carried from one place to another, it was covered first with a 'covering of badgers' skins,' and above this with 'a cloth wholly of blue;' and in the tabernacle and temple it was put into the 'most holy place,' into which the high-priest alone was to enter upon the 'day of atonement.' The ark was called the A. of the C., because it was the appointed symbol of the presence of God as the God of Israel, and of his covenant with his people. The things of the Jewish dispensation being regarded as typical, and the Jewish religion as essentially one with the Christian, the ark is commonly regarded as a type of Christ; the excellency and unchangeableness of the moral law, as indicated by the place assigned to it within the ark, which, however, sprinkled with the blood of typical sacrifice, was interposed between it and men, who, having transgressed it, were exposed to its curse; and the mercy-seat, in like manner sprinkled with the blood of sacrifice, was interposed, as it were, between the law and God, who is represented in the Old Testament as 'dwelling between the cherubims,' and thence shining forth as the God of mercy, favorable to his worshipers. A complete harmony is thus made out between these Old-Testament types and Christian theology.—It is worthy also of notice, that sacred arks or chests have been connected with the worship of various heathen nations, and have been placed as the most sacred things in the innermost parts of the temple, which only the priests were permitted to enter. The relation of these to the ark of the Jews has been the subject of much learned inquiry, but has not yet received thorough and satisfactory elucidation.—The ark appears not to have been brought back from Babylon, and so never to have been in the second temple. No figure of it appears among the sacred vessels of the temple represented on the Arch of Titus.

ARKO'NA, the north-east promontory of the island of Rügen, in the Baltic, almost the most northern extremity of Germany. Its steep cliffs mainly consist of mixed chalk and loam, with horizontal veins of flint; there is a small deposit of pure chalk towards the east. Myriads of sand-martins build in the clefts of these cliffs. The view from their summit extends to the coast of Jasmund on the right, on the left to the islands of Hiddensöe and Möen. The name A. is very ancient. In the chronicles of Saxo Grammaticus we find it written Archona, but its derivation is quite uncertain. On the west side is the famous wall or fortified enclosure in which stood the temple of the Wend deity Swantewit. King Waldemar I. of Denmark, after a bloody conflict, took possession of the fortress in 1168, burnt the idol and its temple, and carried away its treasures to Denmark. On its site, a light-house, 75 feet high, was built in 1827.

A'RKWRIGHT, SIR RICHARD, celebrated for his inventions in cotton-spinning, was born at Preston, in Lancashire, Dec. 23, 1732. Of humble origin, the youngest of thirteen children, and bred to the trade of a barber, his early opportunities of cultivation were exceedingly limited. In 1760, he gave up his business as a barber in Bolton, and became a dealer in hair. A secret process for dyeing hair, said to have been discovered by himself, increased considerably the profits of his trade. Very little is known regarding the first movements of his mind in the direction of mechanical invention. His residence in the midst of a cotton-spinning population naturally led him to take an interest in the process used in that manufacture. That the development of his mechanical ingenuity was not, however, due to circumstances, is sufficiently proved by the fact, that his first effort was an attempt to discover the perpetual motion. Having no practical skill in mechanics, he secured the services of a watchmaker, named Kay, to assist him in

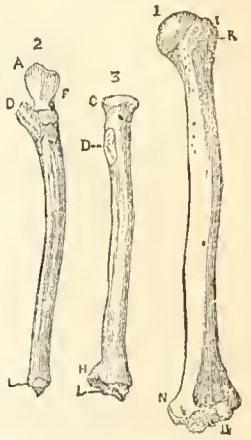
the construction of his apparatus. About 1767, he seems to have given himself wholly up to inventions in cotton-spinning. In the following year he removed to Preston, where he set up his first machine, the celebrated *spinning-frame*, consisting chiefly of two pairs of rollers, the first pair moving slowly in contact, and passing the cotton to the other pair, which revolved with such increased velocity as to draw out the thread to the required degree of fineness. No previously invented machinery had been able to produce cotton-thread of sufficient tenuity and strength to be used as warp. An invention, indeed, by Mr. Charles Wyatt of Birmingham, which was patented in 1738, but never succeeded, deprives A. of the honor of having been the first to use rollers in spinning; but there is no reason to believe that he owed anything to this previous attempt. The first suggestion of the idea, he said, was derived from seeing a red-hot iron bar elongated by being made to pass between rollers. At this time A. was so poor that he needed to be furnished with a suit of clothes before he could appear to vote at an election as a burgess of Preston. Soon after, he removed to Nottingham, to escape the popular rage, which had already driven Hargreaves, the inventor of the *spinning-jenny*, out of Lancashire. Here he fortunately fell in with Mr. Jedidiah Strutt of Derby, the celebrated improver of the *stocking-frame*, who entered into partnership with him, in conjunction with his partner Mr. Need. In 1769 A. set up his first mill, driven by horses, and took out a patent for his invention.

In 1771 he set up a larger factory, with water-power, at Cromford, in Derbyshire. The remarkable capabilities of his mind were strikingly evinced in the management of the great business which now demanded his undivided attention. Without personal experience, and with no model to guide him, he introduced a system of management so admirable that it was afterwards universally adopted, and has never been materially improved. In 1775 he took out a fresh patent for various additional improvements in machinery. The success attending these undertakings stimulated rivals to invade his patent; and to such an extent did other cotton-spinners use his designs, that he was obliged, in 1781, to prosecute nine different manufacturers. The first action against Colonel Mordaunt, backed by a strong combination of Lancashire manufacturers, was lost, solely on the ground that his description in his specification was not sufficiently clear and distinct. The other actions were abandoned; and, in the following year, A. published a pamphlet containing a statement of his case. In a new trial, in 1785, he obtained a favorable verdict. The whole question, however, was brought finally before the Court of King's Bench, a few months after, when A.'s claim to the inventions patented was for the first time called into dispute. On the doubtful evidence of a person named Highs, or Hayes, combined with that of A.'s old assistant Kay, the jury decided against him, and his patent was annulled. This was but the formal outcome of an opposition which had from the beginning marked out A. as an object of hostility. The manufacturers at first combined to discountenance the use of his yarn. When the yarn was made into calicoes, and parliament was petitioned to lessen the duty on that cloth, they strenuously opposed the measure, but in vain. Popular animosity was also excited against the man who abridged labor, but in reality increased its sphere; and on one occasion, a large factory belonging to A. was destroyed in the presence of a powerful military and police force, without a word of interference from the magistrates. The energy and good sense of A., however, triumphed over all opposition; and at the time of his death, in 1792, the value of his property amounted to about half a million sterling. In 1786 he was appointed high-sheriff of Derbyshire; and on the occasion of presenting an address to the king, congratulating him on his escape from the knife of the maniac Margaret Nicholson, he received the well-merited honor of knighthood. A severe asthma had pressed upon him from his youth; and a complication of disorders, the result of his busy sedentary life, terminated his honorable career at the comparatively early age of sixty.

ARLES (anciently, Arelate), one of the oldest towns in France, situated on the left bank of the principal branch of the Rhone, after it has divided into a delta, in the department of Bouches du Rhone. Pop. (1876) of the municipality, 23,997; of the town, 15,563. A. carries on a considerable trade. It has manufactures of silk, hats, tobacco, brandy, &c., and forms a market for the productions of the surrounding country. It also possesses a college, a naval school, a public library, and a superb museum of antiquities in natural history. The marshes which rendered the district so unhealthy for a long time, have been considerably drained, and a canal has been formed which connects it with the south coast. Railways also bring it into easy communication with Marseille, Avignon, Nimes, Montpellier, &c. Under the Romans, it was the seat of a prefect; afterwards, for some time, the residence of the Gothic king, Eurich; and, in 879, was the metropolis of the kingdom of Arelate (See BURGUNDY). In the early Christian times, several important synods were convened here (314, 354, 452, and 475 A.D.). Among the antiquities of A. are a magnificent amphitheater, which could contain between 20,000 and 30,000 spectators; the ruins of a theater, also of a palace of Constantine the Great; an obelisk of granite, dug up from the mud of the Rhone in 1389; a burial place (the Elysian Fields) used by the Romans; and a medieval cathedral, in the old Roman style, with a splendid portal arch.

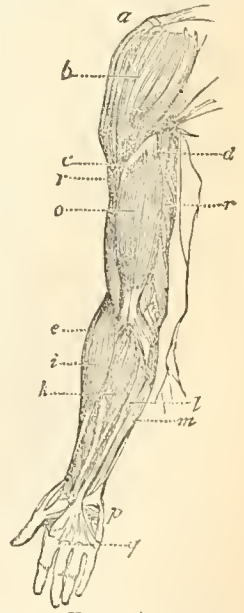
ARLON (anc. *Orolanum*), a town of Belgium, the capital of the province of Luxemburg, 24 m. W.N.W. from Luxemburg. It is a neat and prosperous town, and has a considerable trade in corn, woollen stuffs, leather, iron, &c. It has frequently suffered the ravages of war. The French pillaged it in 1793, after a victory won in its neighborhood over the Austrians. Pop. (1870) about 5800.

ARM, the upper extremity of the human body, consists of two portions—the *A.*, strictly so called, and the forearm; the former having one bone, the humerus (1), which moves freely by a globular head upon the scapula, forming the shoulder-joint; and the latter having two bones, the radius (3) and ulna (2), which move on the lower end of the humerus, forming the elbow joint, and below, with the carpus, forming the wrist.



Bones of the Human Arm.

The humerus is attached by a loose capsular ligament to the scapula, allowing great freedom of motion; and were it not for the muscles passing into I and K, would be frequently dislocated, but it is supported by these muscles on all sides except underneath or opposite the armpit, into which the head of the bone is often driven. The roundness of the shoulder is due to the head of the humerus, so that any displacement is accompanied by a flattening, which at once suggests the nature of the accident. On the shoulder is a large triangular muscle, the deltoid, which lifts the A. from the side. At the back is the triceps, which extends the forearm; in front are two muscles which flex or bend it—the biceps, and the brachialis anticus; and on each side below are muscles passing to the forearm and hand; while on each side above, the great muscle of the back (latissimus dorsi) and that of the chest (the pectoralis major) are inserted on each side of a groove, wherein lies one of the tendons of the biceps (q. v.). The motions of the ulna are flexion or bending effected by the biceps, and extension or straightening by the brachialis anticus and the triceps, its projections D and A being received in these movements into corresponding depressions on the humerus. The movements of the hand are principally due to the radius, the head of which rolls at C and H upon the ulna at F and L, thereby turning the palm downwards (pronation), or restoring the palm upwards (supination), these movements being effected by muscles, two for each movement, which taking their fixed points from the humerus and ulna, pull the radius round on the latter. The elbow-joint is ginglymoid or hinge-like, and therefore has strong lateral ligaments; but it is extremely liable to dislocations, often accompanied by fracture, especially in the young. The accident being followed by severe inflammation, the joint is very apt to stiffen, thereby seriously (see ANKYLOSIS) deteriorating from the usefulness of the limb; it is therefore, unadvisable to keep the limb too long in any one position after such an injury. This joint is also very liable to disease; but as this is confined to the ends of the bones, the small portions of the latter affected can be readily cut out, and the arm be restored to usefulness and mobility in a few weeks.



Human Arm:
abc, deltoid muscle; *d*, coraco brachialis muscle; *r, r*, triceps; *e, i*, extensors of wrist and long supinator of the hand; *km*, flexor of fingers and radial and ulnar sides of the wrist, and *l*, palm of the hand, or palmaris longus; *p*, palmaris brevis; *q*, palmar fascia; *o*, biceps.

The upper extremity is supplied with blood by the brachial artery, the continuation of the axillary trunk. The veins collect into large superficial trunks, which unite at the bend of the elbow, at which situation one is frequently selected for venesection, and then pass on to the axillary, on the outside by the cephalic vein, on the inner side by the basilic.

The nerves pass down as large cords by the side of the artery, and diverge from it to their ultimate distributions; the musculo-spiral soon passing round at the back to appear on the outside, and become the radial and posterior interosseous nerves; the ulnar running behind

the internal condyle, N, for which it has obtained the term 'funny bone,' from the electric-like thrill which passes along the arm when the nerve is struck or pressed. The median, as its name implies, keeps a middle course with the artery.

In wounds of the forearm, the bleeding is often excessive, but may be at once controlled by pressure on the brachial artery, on the inner side of the biceps.

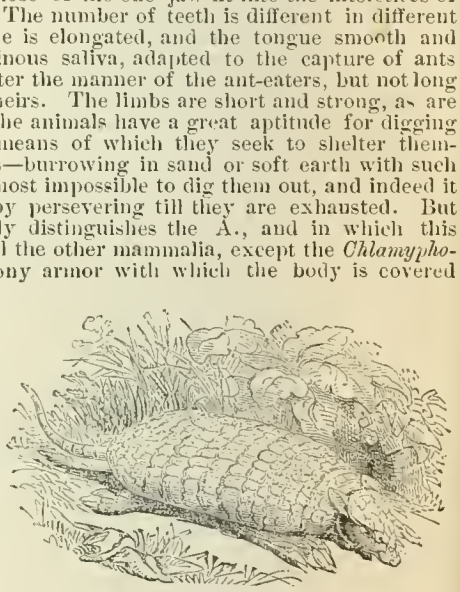
The arm affords excellent illustrations of some of the principles of mechanics. The insertion of the muscles so near, as will be seen, to the fulcra or centers of motion, involves a loss of power in the usual sense of the word; there is, however, a corresponding gain in velocity at the end of the lever; and for most of the purposes to which the hand is put, agility is of far greater moment than dead strength.

ARM. In maritime language, besides the obvious application to weapons of warfare, this term is applied to each extremity of a bibb, or braeket, attached to the mast of a ship for supporting the trestle-trees. The same name is also given to a part of the anchor. See ANCHOR.—In military language, the infantry, the cavalry, the artillery, and the engineers are each called 'an A.' of the service—equivalent to branch or department.

ARMA'DA, a Spanish word signifying simply an armed force, but applied specially to the great Spanish fleet which invaded England in 1588. The king of Spain, Philip II., had resolved to strike a decisive blow at the Protestant interest, by conquering England, which Pope Sixtus V. had made over to him. The ports of Spain, Portugal, and other maritime dominions belonging to him, had long resounded with the noise of his preparations, and the most eminent Catholic soldiers from all parts of Europe flocked to take a share in the expedition. The Marquis of Santa-Croce, a sea-officer of great reputation and experience, was destined to command the fleet, which consisted of a hundred and thirty vessels, of greater size than any that had been hitherto seen in Europe. The Duke of Parma was to conduct the land-forces, 20,000 of whom were on board the ships of war, and 34,000 more were assembled in the Netherlands, ready to be transported to England; so that, as no doubt was entertained of success, the fleet was ostentatiously styled the Invincible A. Nothing could exceed the terror and consternation which seized all ranks of people in England upon the news of this terrible A. being under sail to invade them. A squadron of not more than thirty ships of the line, and those very small in comparison, was all that Elizabeth had to oppose it by sea; and it was considered impossible to make any effectual resistance by land, as the Spanish army was composed of men well disciplined and long inured to danger. But although the English fleet was much inferior in number and size of shipping to that of the enemy, it was much more manageable, while the dexterity and courage of the mariners were greatly superior. Lord Howard of Effingham, a man of great valor and capacity, took upon him, as lord high admiral, the command of the navy; Drake, Hawkins, and Frobisher, the most renowned seamen in Europe served under him; while another squadron, consisting of forty vessels, English and Flemish, commanded by Lord Seymour, lay off Dunkirk, in order to intercept the Duke of Parma. Such was the preparation made by the English; while all the Protestant powers of Europe regarded this enterprise as the critical event which was to decide for ever the fate of their religion.

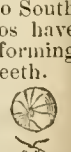
In the meantime, while the Spanish A. was preparing to sail, the admiral, Santa-Croce, died, as likewise the vice-admiral, Paliano; and the command of the expedition was given to the Duke of Medina Sidonia, a person utterly inexperienced in sea-affairs; these unexpected circumstances served, in some measure, to frustrate the design. Some other accidents also contributed to its failure. Upon leaving the port of Lisbon, the A. next day met with a violent tempest, which sank some of the smallest of the ships, and obliged the rest to put back into the harbor. After some time spent in refitting, the Spaniards again put to sea, where they took a fisherman, who gave them intelligence that the English fleet, hearing of the dispersion of the A. in a storm, had returned to Plymouth, and that most of the marines were discharged. From this false intelligence, the Spanish admiral, instead of going to the coast of Flanders, to take in the troops stationed there, resolved to sail directly to Plymouth, and destroy the shipping laid up in the harbor. But Effingham was very well prepared to receive him, and had just got out of port, when he saw the Spanish A. coming full sail towards him, disposed in the form of a half-moon, and stretching seven miles from the one extremity to the other. The English admiral, seconded by Drake, Hawkins, and Frobisher, attacked the Spaniards at a distance, pouring in their broadsides with admirable dexterity. They did not choose to engage the enemy more closely, because they were greatly inferior in number of ships and guns, as well as in weight of metal; nor could they pretend to board such lofty vessels without manifest disadvantage. In this action, however, two Spanish galleons were disabled and taken. As the A. advanced up the Channel, the English still followed and infested its rear; and as their ships continually increased from different ports, they soon found themselves in a capacity to attack the Spanish fleet more nearly, and accordingly fell upon them while they were taking shelter in the port of Calais. To increase their confusion, Howard selected eight of his smaller vessels, which, after filling them with combustible materials, he sent one after another, as if they had been fire-ships, into the midst of the enemy. The Spaniards, taking them for what they seemed to be, immediately bore off in great disorder; while the English, profiting by their panic, captured or destroyed about twelve ships. The Duke of Medina Sidonia being thus driven to the coast of Zealand, held a council of war, in which it was resolved, that, as their ammunition began to fail, as their fleet had received great damage, and as the Duke of Parma had refused to venture his army under their protection, they should return to Spain by sailing round the Orkneys, as the winds were contrary to their passage directly back. Accordingly, they proceeded northward, and were followed by the English fleet as far as Flamborough Head, where they were terribly shattered by a storm. Seventeen of the ships, having 5000 men on board, were afterwards cast away on the Western Isles and the coast of Ireland. Of the whole A., fifty-three ships only returned to Spain, and these in a wretched condition. The seamen, as well as the soldiers who remained, were so overcome with hardships and fatigue, and so dispirited by their discomfiture, that they filled all Spain with accounts of the desperate valor of the English, and of the tempestuous violence of that ocean by which they were surrounded.

ARMADI'LLO (*Da'sypus*), a genus of mammalia of the order *Edentata* (i. e., toothless)—not, however, truly toothless, but having feeble teeth destitute of true roots, and set apart from each other, and so that those of the one jaw fit into the interstices of those of the other. The number of teeth is different in different species. The muzzle is elongated, and the tongue smooth and slender, with a glutinous saliva, adapted to the capture of ants and other insects, after the manner of the ant-eaters, but not long and extensile, like theirs. The limbs are short and strong, as are also the claws, and the animals have a great aptitude for digging and burrowing, by means of which they seek to shelter themselves from enemies—burrowing in sand or soft earth with such rapidity that it is almost impossible to dig them out, and indeed it can only be done by persevering till they are exhausted. But that which peculiarly distinguishes the A., and in which this genus differs from all the other mammalia, except the *Chlamyphorus* (q. v.), is the bony armor with which the body is covered and which consists of polygonal plates not articulated, united on the head to form a solid covering, and similarly to form solid bucklers over the shoulders and the haunches; and between these, disposed in transverse bands, which allow of freedom of motion to the body, similar bands in most species protecting also the tail. Armadillos feed not only on insects, but on vegetable and animal food of almost every kind, which by decomposition or otherwise has acquired a sufficient softness. Some of them prefer vegetable food, others delight chiefly in carrion. They are all natives of the warm and temperate parts of South America, in the woods and pampas of which they are found in immense numbers. They are timid, and inoffensive, although, when they are incautiously assailed, injury may be received from their claws. Their flesh is esteemed a delicacy, particularly that of the species which feed chiefly on vegetable food. The largest species is fully three feet long, exclusive of the tail; the smallest, not above ten inches. The species are numerous, and the genus has been divided into a number of subgenera, which some naturalists elevate into genera, naming the family *Loricata* (i. e., mailed). To this family belongs also the genus *Chlamyphorus*, also South American. Fossil remains of gigantic extinct armadillos have been found in the pleistocene strata of South America, forming the genus *Gly'ptodon* of Owen, so named from the fluted teeth.



Armadillo.

ARMADI'LLO is also the scientific name of a genus of *Crustacea* of the order *Isopoda* of Cuvier. This is one of the genera usually included under the popular name of Woodlouse, and one of which (*Porcellio*) is very generally known by that of Slater. The armadillos derive their name from the scaly armor of their body, in which an analogy is found to the mailed quadrupeds of South America. They have, in a remarkable degree, the power of rolling themselves into a ball, when alarmed, so as to expose nothing but



Armadillo.

the plates of the back, and have thence received the name of Pill Beetles. Like some of the other closely allied *Isopoda*, they were at one time reputed to possess medicinal virtues, now accounted merely imaginary. They were not only used in a dried and pulverized state, but they are said to have been actually swallowed entire as pills. *A. vulgaris* is not uncommon in damp places, under stone, &c., in Britain.

ARMA'GH, a small inland county in Ulster, Ireland; bounded N. by Lough Neagh, E. by Down, S. by Louth, W. by Monaghan and Tyrone. Its greatest length is 32 miles, and breadth 20. Area, 512½ square miles, about four-fifths being arable, and a 36th part in woods. The surface is hilly in the south, and undulating in the center, attaining in Slieve Gullion, in the south-west, the height of 1893 feet. The other chief heights are the Newry Mountains, 1385 feet; the Armagh-breague Hills, 1200; and Mullyash, 1034. The country bordering upon Lough Neagh is low and boggy, and the Louth plain extends into the south end of A. The principal rivers, navigable in their lower parts, are the Upper Bann, flowing out of Down north-west for 11 miles before it enters Lough Neagh; and the Blackwater, which, in its lower part, separates A. from Monaghan. The rocks of A. are—Lower Silurian in the south and middle of the county; the trap of Antrim, with the underlying greensand, around Portadown; carboniferous limestone in the basins of the Blackwater, and its tributary the Callan; granite in the mountains of the south-east; and tertiary strata bordering Lough Neagh. The soil is fertile except in the southern extremities. In 1880, 163,236 acres were in crop, the principal crops being oats, potatoes, wheat, turnips, and flax. The stock in that year was 13,815 horses, 79,474 cattle, 9125 sheep, 15,136 pigs. The north and central parts of A. exhibit a dense population, low hills cultivated to the tops, hedgerows, orchards, and thickly-scattered farm-steadings. The county is mostly in the diocese of Armagh. It returns three members of parliament—two for the county, and one for the city. The chief towns are A., Lurgan, Portadown, and Newry. Pop. (1871) 179,260, of whom 85,057 are Roman Catholics, 58,343, Episcopalians, and 28,344 Presbyterians; (1881) 163,177—a large decrease.

ARMA'GH, the capital of the county of A., in a carboniferous limestone district, in the north-west of the county. It is situated around and on a gentle eminence, hence its original name, Ard-Magha, 'the high field.' It is built of limestone. The cathedral is built of red sandstone, and is cruciform—184 by 119 feet—and is supposed to occupy the site of that erected by St. Patrick in the 5th c. It has recently been repaired, chiefly at the cost (£10,000) of the late Lord Primate, Lord Beresford. A Gothic Roman Catholic cathedral occupies the principal height to the north, and the primatial palace that to the south. There is a fever hospital for forty patients, maintained by the late primate, and a lunatic asylum for four counties. A. is the seat of the archiepiscopal see of the Primate and Metropolitan of all Ireland, who, before the disestablishment of the Irish church, had an income of £12,087 a year. Pop. (1871) 8946, of whom 4691 were Roman Catholics, 3020 Episcopalians, 918 Presbyterians; while in 1881 it was 10,070. The chief manufacture is linen-weaving. A., from the year 495 to the 9th c., was the metropolis of Ireland, the native kings living at Eamania, 2 miles to the west of the city. It was then renowned as a school of theology and literature—its college being the first in Europe. After the Reformation, it suffered severely in the conflicts between the English and Irish; and it contained only three slated houses in 1765.

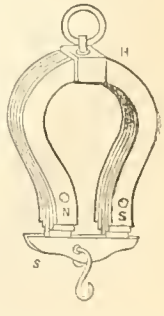
ARMAGNAC (*Ager Aremonicus*), the old name of the district in the south of France, which at one time seems to have extended from the valleys of the Pyrenees to the Garonne. It is now included in the departments of Hautes Pyrénées and Gers. The remarkably fertile land, producing grain and the best descriptions of wine, and also favorable for pasturage, is cut up into an extraordinary number of small estates, and divided among numerous petty proprietors. The principal branch of trade is the distillation of the brandy known in commerce as *Eau d'Armagnac*, which rivals those of Cognac and Saintonge. The ancient capital is Lectoure, on the river Gers, with (1872) 2820 inhabitants. To the south of it lies Auch, the chief town of the department of Gers. Pop. (1872) 9414. The people are noted for their simplicity, strength, and bravery; but, on the other hand, they are extremely credulous and ignorant. Formerly, their services were highly valued in times of war. The A. family, descended from the old Merovingian king, Clovis, played an important part in French history.

A'RMAMENT is a general name for the weapons of war employed in sea and land battles; all the weapons collectively being called *the* A. of a ship or an army.

ARMANSPERG, Jos. Ludw., Count of, formerly president of the government in Greece, was born in Lower Bavaria in 1787, and early embraced an administrative and diplomatic career. On the accession of King Louis to the throne, A., who had already occupied several important posts, was summoned to Munich, where, rapidly rising from one dignity to another, he at length became minister of finance and of foreign affairs. In both capacities he proved active and successful; but he drew upon himself the hatred of the Camarilla by his strenuous opposition to the claims of Rome, as well as by his attempts to identify himself with the decidedly liberal party. The consequence was that, in 1831, he lost his post, and in the same year was appointed ambassador to London, but preferred retiring to his family estate. However, he could not resist the king's repeated request that he should undertake the formation of his son's government in Greece, and accordingly, accompanying young King Otho, A. landed at Nauplia in January 1833. For four years he was at the head of public affairs, and Greece derived many benefits from his administration; but the heat of the party strife and court intrigues led to his dismissal, and he left Greece in March 1837. After that time he lived in retirement upon his property, near Deggendorf, till his death in 1853.

ARMATO'LES, a body of Greek militia, first formed under the reign of Sultan Selim I. about the beginning of the 16th c. They were intended to preserve the fertile plains from the ravages of the *Klephts* (mountain robbers of Thessaly), who had never been entirely conquered by the Turks. The A. themselves were orginally Klephts, but received their more honorable designation when the Porte had metamorphosed them into a sort of military police. The safety of the public roads was intrusted to their care. The whole of Northern Greece was divided into sixteen districts (*capitaineries*), each placed under the supervision of a chief of these militia, who, however, had himself to receive orders from a Turkish pasha or Greek bishop. But although the A. frequently suppressed the brigandage of the Klephts, they still regarded them in the light of brothers, inasmuch as they had a common origin and faith; both detested the oppressors of their country; and the sentiment of patriotism overruled every other consideration. This sympathy at last appeared to the Turks so dangerous that they grew alarmed, and desired to substitute for the A. the Mohammedan Albanians, who were the implacable enemies of the Greeks, which resolution did not a little to hasten the insurrection which the Porte ever dreaded. The moment it broke out, the A. pronounced themselves in favor of the national cause, and in the war of independence that ensued, distinguished themselves by their brilliant exploits.

A'RMATURE (*armatura*, armor; Ger. *anker*). The term A. is applied to the pieces of soft iron that are placed at the extremities or poles of magnets to preserve their magnetic power. When magnets are allowed to remain any length of time without such appendages, in consequence of the disturbing influence of terrestrial magnetism they lose considerably in strength; but when they are provided with them their magnetism is kept in a state of constant activity, and thereby shielded from this disturbance. The reason of this is found in two facts well known in the science of magnetism—viz., that when a piece of soft iron is brought into contact with the extremity of a magnet, it is itself induced to become magnetic; and that the unlike poles of two different magnets powerfully attract each other. Referring to the figure the north pole, N, of the horseshoe magnet, NHS, acting on the armature *sn*, induces it to become a magnet, having its south pole, *s*, next to N, and its north pole, *n*, at the opposite extremity. The pole S, by virtue of its magnetic affinity, powerfully attracts the north pole, *n*, thus formed, and adds its own inducing influence to heighten the magnetic condition previously induced in the armature by the pole N. The A., from the combined action of both poles of the horseshoe magnet, is thus converted into a powerful magnet, with its poles lying in an opposite direction to that of the primary poles. The original magnet is, in consequence, brought into contact with one of its own making, the exact counterpart of itself—a condition highly favorable to the maintenance of its strength. It is due to the same mutual attractions that much larger weight can be suspended from the A. thus placed, than what the single poles can together sustain. Bar magnets may be armed in the same way by laying them at some distance parallel to each other, with their unlike poles towards the same parts, and then connecting their extremities by two pieces of soft iron. When a magnet, such as a compass-needle, is free to take up the position required by the magnetism of the earth, the earth itself plays the part of an armature.



ARMED SHIP, in the official language of the Royal Navy, occupies a sort of medium position between a merchant-ship and a man-of-war. It is a private vessel, hired occasionally by the Admiralty for a special purpose, and commissioned for a temporary period. The duty is usually that of guarding some particular coast, or attending on a particular fleet, during a time of war; and while so employed, it is officered and equipped like one of the smaller ships-of-war in the Royal Navy.

ARME'NIA, a high table-land on the southern slope of the Caucasus, stretching down towards Mesopotamia. It has had

different boundaries in the various centuries of its history. It is the original seat of one of the oldest civilized peoples in the world, the Armenians, who belong to the Indo-Germanic family of nations. Their oldest records contain nothing certain beyond the facts that, in ancient times, they were governed by independent kings, but afterwards became tributary to the Assyrians and Medes. That dim period which wavers between myth and history begins, in the case of A., about the middle of the 6th c. B.C., when King Dikran, or Tigranes I. of the Haig Dynasty, restored the independence of the kingdom. The last king of this dynasty was slain in battle against Alexander the Great, who conquered the country. After Alexander's death, A passed through several changes of fortune under the Seleucidæ, who appointed governors over it. Of these, two—Artaxias and Zariadres—made themselves independent of their sovereign, Antiochus the Great, during the time when he was engaged in his contest with the Romans, 223—190 B.C. They divided the province into two districts—Artaxias taking A. Major (that part of the country lying E. of the Euphrates), and Zariadres A. Minor (the part to the W. of that river). The dynasty of Artaxias did not reign long; for about the middle of the 2d c. B.C., we find A. Major in the possession of a branch of the Parthian Arsacidæ, of which the most powerful king was Tigranes the Great, who added to the conquests made by his predecessors in Lower Asia and the region of the Caucasus, Syria, Cappadocia, and A. Minor; defeated the Parthians, and took from them Mesopotamia and other countries. He lost all these territories by his war with the Romans, into which he was led by his father-in-law, Mithridates, king of Pontus, in 63 B.C. After this, the assaults of the Romans from the west ever growing more and more vigorous, and those of the Parthians from the east, hastened the downfall of A. Major. The successors of Tigranes became dependent, partly on the one nation and partly on the other, while internally the nobles broke through the restraints of a feeble monarchy, and claimed the privileges of petty kings. Under Trajan, A. Major was for a short time a Roman province. Its subsequent history exhibited an unbroken series of tumults and wars, of violent successions to the throne, despotic reigns, and rapid decay. In 232 A.D. the province was conquered by the Sassanides, who held possession of it 28 years, until Tiridates III., the rightful heir, was restored to the throne by Roman assistance.

It was about this time that Christianity became the religion of A., which was thus the first nation to embrace the new religion. Tiridates himself had been converted by St. Gregory the Illuminator as early as about 300 A.D. The old religion of Armenia had for its basis the doctrines of Zoroaster, with a curious intermixture of Greek mythology, and of ideas peculiar to the country. It is certain that the Armenians worshiped as their mightiest gods, Aramazt and Mihir (the Ormuzd and Mithras of the old Persians); but they had also a kind of Venus, whom they styled Anaitis, and several other deities, to whom they offered animal sacrifices. This change of creed, however, made no improvement in the political circumstances of the falling state. The Byzantine Greeks on one side, and the Persians on the other, regarded A. as their prey; and in 428, Bahram V. of Persia made A. a province of the empire of the Sassanides, and with the deposition of Artasir the dynasty of the Arsacidæ was brought to a close. The rule of the Sassanides in A. was marked chiefly by their sanguinary but unsuccessful attempts to extirpate Christianity. In 632, the unhappy country was subjected to another form of despotism under the Arabian califs, and suffered terribly during their contest with the Byzantine emperors. In 885 A.D., Aschod I., of an old and powerful Armenian family, ascended the throne, with the permission of the califs, and founded the third Armenian dynasty—that of the Bagratidæ. Under them A. was prosperous till the 11th c., when divisions and internal strife began to weaken the country; till at length the Greeks, having murdered the last monarch of the Bagratidæ, seized a part of the kingdom, while the Turks and Kurds made themselves masters of the rest—only one or two of the native princes maintaining a perilous independence. In 1242, the whole of A. Major was conquered by the Mongols, and in 1472 became a Persian province. Afterwards the western part fell into the hands of the Turkish sultan, Selim II.

The fate of A. Minor was hardly better. The dynasty founded by Zariadres prevailed to the time of Tigranes the Great, sovereign of A. Major, who conquered the country about 70 B.C. Afterwards A. Minor was subjugated by the Romans, and made a Roman province. On the divison of the Empire into eastern and western, it became attached to the former, and shared in all its changes of fortune until near the close of the 11th c. At this time A. Minor—which had long been a place of refuge for many who had fled from the rage of the Turks and Persians in the sister province—was again raised to independence by Rhupen (a refugee from A. Major, and descendant of the Bagratidæ). His successors extended their dominion over Cilicia and Cappadocia, and took a prominent part in the Crusades.

This dynasty ruled prosperously until 1374, when A. Minor was conquered by the Egyptian sultan Schaban. Since that time A., with the exception of the parts which Russia has won in the present century from Persia, and which are better governed, has remained subject to the despotism of the Turks and Persians. Notwithstanding this, the Armenians have steadily preserved their nationality, both in its physical and moral lineaments; their faith; and even—though only a relic of their ancient culture—a higher civilization than their conquerors. The political storms which devastated the country during the middle ages, and the persecutions of the Turks, have driven many of the inhabitants from their homes. This is the reason why we find them scattered over all Asia and Europe. In Hungary, Transylvania and Galicia they number 10,000. They are very numerous in Russia, but most of all in Asia Minor, and in the neighborhood of Constantinople, where they number 200,000.

The greater part of A. is an elevated table-land. Its area is estimated at 90,000 square miles; pop. about 2,000,000. It is watered by the rivers Kur, Aras, Joruk, Euphrates, and to a slight extent by the Tigris. The lakes which lie within this mountainous region are Van, Urumiyah, and Sevan. The Armenian plateau, on the eastern side of which the volcanic range of Ararat lifts itself, forms the central point of several mountain-chains, such as Taurus and Antitaurus, the mountains of Kurdistan, and those which run north to the Black Sea. It exhibits numerous traces of having been subject to volcanic agency, and even yet—as was shown by the severe earthquake of the summer of 1840, and by the total destruction of Erzerum in 1859—possesses an internal volcanic activity. The climate in the higher regions is hot in summer and cold in winter, but in the valleys it is more temperate. The country labors under a great scarcity of wood, and in some parts is sterile, through a deficiency of water; in other parts the soil is extremely fertile, producing rice, hemp, flax, tobacco, wine, cotton, and many varieties of fruit. Cattle breeding and grazing are more extensive than agriculture. The mountains contain iron, copper, lead, salt, and naphtha. The number of the inhabitants of pure Armenian origin is reckoned at nearly 1,000,000, but there is a large admixture of Turkomans, Greeks, Jews, Kurds, &c. The Armenians belong physically to the finest variety of the Indo-Germanic race. Their intellectual capacity is also remarkable, as is shown both by their literature, and their singular dexterity in business. Still, long centuries of oppression have exerted a withering influence on their native strength of character. The north-east portion of A., about one-third of the whole, was wrested from Persia in 1828, and is under the Russian sceptre. About a sixth part to the south-east still belongs to Persia. The western portion, comprising two-thirds of the Armenian area, is Turkish. After the war of 1877–78 between Russia and Turkey, the Berlin Conference sanctioned the cession to Russia of a strip of A., including Kars and Ardahan; and the Sultan engaged to carry out in A. much-needed reforms, guarantee the Armenians security against the Circassians and Kurds, and undertook to report to the European powers the measures adopted.

ARME'NIAN CHURCH. Christianity appears to have been introduced into Armenia as early as the 2d c. It was for the first time firmly established, however, about the end of the 3d c. by the apostolical exertions of Bishop Gregory (q. v.), who converted Tiridates (see ARMENIA). The Bible was translated into the Armenian language in the 5th c. After this period great animation prevailed in the A. C. Numbers flocked to the colleges at Athens and Constantinople. In the ecclesiastical controversy concerning the twofold nature of Christ, the Armenian Christians held with the Monophysites (q. v.); refused to acknowledge the authority of the Council of Chalcedon; and constituted themselves a separate church, which took the title of Gregorian from Gregory himself. For several centuries a spirit of scientific inquiry, especially in theology, manifested itself among them to a far wider extent than in the other Eastern churches. Their greatest divine is Nerses of Klah, belonging to the 12th c., whose works have been repeatedly published. The most recent edition was issued in Venice, 1833. The Gregorians have continued to entertain a deeply rooted aversion to the so-called orthodox church. The Roman Catholic popes at various times, especially (1145, 1341, 1440) when the Armenians accepted the help of the West against the Mohammedans, tried to persuade them to recognize the papal supremacy; but for the most part only the nobles consented to do so, while the mass of the people clung to their peculiar opinions, as we see from the complaint of Pope Benedict XII., who accuses the A. C. of 117 errors of doctrine. There is a sect of *United Armenians* in Italy, Poland, Galicia, Persia, Russia, and Marseille. Since the formation of this body in 1835, vigorous and constant attempts, succored especially by French influence, have been made to secure the acknowledgment of the pope as the head of the Roman Catholic portion of the A. C. When this end seemed nearer attainment than ever before, the Ultramontane utterances of their representative, Mgr. Hassun, at the Ecumenical Council at Rome, 1870, in favor of infallibility, created such a reaction at home as has greatly strengthened for the present the cause of the old Gregorian party. The recent humiliation of France has further weakened

the cause of the pro-papal party. In theology the A. C. attributes only *one* nature to Christ, and holds that the Spirit proceeds from the Father alone; the latter doctrine, however, being held by it in common with the 'orthodox Greek Church,' although contrary to the theology of the western churches. With respect to the 'seven sacraments,' it entertains the peculiar notions that at baptism one must be sprinkled three times, and as often dipped; that confirmation is to be conjoined with baptism; that the Lord's Supper must be celebrated with pure wine and leavened bread; that the latter, before being handed round, must be dipped in the former; and that extreme unction is to be administered to ecclesiastics alone, and that immediately after (and not before) their death. It believes in the worship of saints, but not in purgatory. It exceeds the Greek Church in the number of its fasts, but has fewer religious festivals. These, however, are more enthusiastically kept.

Divine service is held in Turkey chiefly by night. Mass is celebrated in the old Armenian language; preaching is carried on in the new. Its sacerdotal constitution differs little from the Greek. The head of the church, whose title is Catholikos, resides at Etshmiadzin, a monastery near Erivan, the capital of Russian Armenia. To this place every Armenian must make a pilgrimage once in his life. The monks of this church follow the rule of St. Basil. The Wartabieds form a peculiar class of ecclesiastics; they live like monks, but are devoted exclusively to learning. Secular priests must marry once, but none are at liberty to take a second wife.

ARME'NIAN LITERATURE. Previous to the introduction of Christianity by Gregory (300 A.D), the Armenians had adhered to the Assyrian or Medo-Persian system of culture; but excepting a few old songs or ballads, no remains of that early period exist. After their conversion to Christianity, the Greek language and its literature soon became favorite objects of study, and many Greek authors were translated into Armenian. (See Wenrich *De Auctorum Græcorum versionibus Arabicis, Armeniacis*, &c. Leipzig, 1842.) The Armenian language has an alphabet of its own, consisting of 36 letters, introduced by Miesrob in 406. The most flourishing period of A. L. extends from the 4th to the 14th c. The numerous Armenian theological writers and chroniclers of this era supply materials for a history of the East during the middle ages which have hitherto been too much neglected. These Armenian writers generally copied the style of the later Greek and Byzantine authors; but in adherence to facts and good taste, they are superior to the general order of oriental historians. In the 14th c., literature began to decline, and a few remarkable works were afterwards produced; but since the time of their dispersion, the Armenians have preserved recollections of their national literature; and wherever they are found—in Amsterdam, Lemberg, Leghorn, Venice, Astrakan, Moscow, Constantinople, Smyrna, Ispahan, Madras, or Calcutta—the printing-office is always a feature in their colonies. The most interesting Armenian settlement is that of the Mechitarists (q. v.), on the island of San Lazaro, near Venice.

The Bible translated into Armenian (the Old Testament from the text of the Septuagint) by Miesrob and his scholars (411 A.D.), is esteemed the highest model of classic style. Translations of several Greek authors made about the same time, have been partly preserved, and contain some writings of which the originals have been lost—namely, the Chronicle of Eusebius; the Discourses of Philo; Homilies by St. Chrysostom, Severianus, Basil the Great, and Ephraim Syrus. Several old geographical and historical works have been preserved. Among philosophical and theological writers may be mentioned: David, the translator and commentator of Aristotle, Esnik, and Joannes Ozniensis. The *Vitæ Sanctorum Calendarii Armeniaci* (Lives of Armenian Saints, 12 vols. Ven. 1814) contains many notices of the history of Armenia. In poetry and fiction, A. L. is poor. Somal, in his work entitled *Quadro della Storia Litteraria di Armenia* (Venice, 1829), gives a general view of the contents of A. L. The Armenian belongs to the Indo-Germanic group of languages, but has many peculiarities of structure. It is harsh and disagreeable to the ear. The old Armenian, the language of literature, is no longer a living tongue; while the new Armenian, split up into four dialects, contains many Turkish words and grammatical constructions.

ARME'RIA. See THRIFT.

ARMENTIERES, a town of the dep. of Nord, France, on the Lys, 8 m. from Lille. The town is well built, and is active and prosperous, having manufactures of cotton, linen, and hemp, and a considerable trade in grain. A. was formerly famous for its cloth, cheese, and brick. Pop. (1876) 20,565.

ARMFELT, GUSTAF MAURITZ, a celebrated Swede, whose public life was characterized by striking vicissitudes of fortune, was the eldest son of Baron Armfelt, and born at Juva, in the government of Abo, on the 1st of April, 1757. Having, as an officer of the royal guard, displayed great activity and zeal in opposing the machinations of the nobles, who were at that period disaffected towards Gustavus III., the latter appreciated the value of his services, and appointed him to a post in the service of the Crown Prince. During the war between Sweden and Russia (1788—90), in which he was commander of one of the three divisions of the Swedish army, he displayed remarkable courage and spirit, and advanced still higher in the good graces of the monarch. He defeated a Russian force at Summa, near Fredrikshamn; and as military representative of Gustavus, had the honor of concluding a peace at Verela on the 14th of August, 1790. On the 16th of March, 1792, Gustavus was assassinated. His wound, though mortal, did not instantly deprive him of life, and he employed the brief interval that elapsed before his death in drawing up a codicil to his will, by which the regency was intrusted to the king's brother, Charles, Duke of Sudermania, during the minority of Gustavus IV., A. being named governor of Stockholm, and member of the council appointed to advise with the regent. The Duke of Sudermania, however, could not brook the idea of a check being placed upon his liberty of action, and found means to destroy the codicil, the conditions of which he never intended to observe. A. soon became conscious that his influence was rapidly evaporating. He was rarely permitted to see the young king; and at last, after a secret interview with young Gustavus, departed as ambassador to Naples in July 1792. While in Italy, he entered into correspondence with certain parties in Sweden for the purpose of overthrowing the regency, and inducing the States to proclaim Gustavus IV. of age. The correspondence was discovered. A. fled to Poland, and afterwards to Russia. He was condemned, during his absence, for high treason, and stripped of his goods and titles, while one of his associates, the beautiful Countess Rudenskold, was subjected to the most brutal punishment, being publicly declared 'infamous,' exposed on a scaffold for some hours, and imprisoned in a house of correction for life. A. expressed his horror for such an atrocity in language sufficiently emphatic, yet, at a later period, he did not scruple to accept office under Charles, on his election to the throne. In 1799, Gustavus IV. received the crown at the age of eighteen, and A. was restored to all his honors. In 1805, he was appointed governor-general of Finland; and in 1808 he commanded the Swedish army raised for the invasion of Norway; but his plans were so completely frustrated, that he was compelled to witness the invasion of Sweden by the successful Norwegians, and was in consequence recalled and dismissed by the king. In the following year a revolution took place, Gustavus was deposed, the Duke of Sudermania elected in his place, and A. was appointed president of the Military Council. But shortly after, being implicated in the poisoning of the Prince of Augustenburg, he was obliged to fly to Russia, where he lived during the remainder of his life in high honor. The title of Count was conferred on him, he was made chancellor of the university of Abo, president of the Board of Finnish Affairs, and member of the Russian senate. He died at Tzarskoe Selo on the 19th of August, 1814.

ARMIDA, one of the most prominent female characters in Tasso's *Jerusalem Delivered*. As the poet tells us, when the Crusaders arrived at the holy city, Satan held a council to devise some means of disturbing the plans of the Christian warriors, and A., a very beautiful sorceress, was employed to seduce Rinaldo and other Crusaders. Rinaldo was conducted by A. to a remote island, where, in her splendid palace, surrounded by beautiful gardens and pleasure-grounds, he utterly forgot his vows, and the great object to which he had devoted his life. To liberate him from his voluptuous bondage, two messengers from the Christian army, Carlo and Ubaldo—came to the island, bringing a talisman so powerful that the witchery of A. was destroyed. Rinaldo escaped, but was followed by the sorceress, who, in battle, incited several warriors to attack the hero, and at last herself rushed into the fight. She was defeated by Rinaldo, who then confessed his love to her, persuaded her to become a Christian, and vowed to be her faithful knight. The story of A. has been made the subject of an opera both by Gluck and Rossini.

ARMIES, armed forces under regular military organization, employed for purposes of national offence or defence. An army may comprise the whole military men employed by the state, or only a portion under a particular commander. When an armed force is under no constituted authority, and imperfect in its organization and discipline, it cannot be said to be worthy of the name of an army, and may be little better than a horde of banditti. Of this nature are the *fillibustering* expeditions (see FILLIBUSTERS) in which certain portions of the citizens of the United States frequently engage. Through long ages of experience, the principles of military organization, and the laws to which A. are specially amenable, have gradually reached a high degree of perfection. The primitive wars among barbarous people are always stealthy, depending on the forest and the wilderness for their tactics, and considered successful if an enemy can be attacked unawares, despoiled, and carried into slavery. After a time, war advances to the position of an art, and is conducted by men who have received a certain training. An army becomes an instrument not only for

vanquishing enemies, but for seizing countries. Even then the highest position of an army is not reached; for the defence of a country requires more military skill, perhaps, and a better organization of troops, than an attack.

In the several historical articles in this *Encyclopædia* relating to the chief nations of ancient and modern times, the wars in which these nations engaged are succinctly noticed as elements in the life of each nation; but it seems desirable, in the present place, as a means of rendering intelligible certain minor details scattered through the work, to give a brief description of the chief points in which the A. of different states or countries have differed in constitution.

ARMIES, ANCIENT—*Egyptians*.—The most extraordinary conqueror among the Egyptians, Sesostris or Rhamses, lived sixteen centuries before the Christian era; and although the evidence for his deeds of valor is very questionable, there is reason to believe that the organization of his A. can be pretty accurately traced. His father, Amenophis, laid the foundation for the military glory of Sesostris. When the latter was born, Amenophis caused all the male children who were born on the same day as his son, to be set apart as a special body, to be reared for a military life; they were taught everything that could strengthen their bodies, increase their courage, and develop their skill as combatants and leaders; and were to consider themselves bound as the chosen dependents or companions of the young prince. In due time Sesostris became king of Egypt; and then he formed a sort of militia, distributed as military colonists, each soldier having a portion of land to maintain himself and his family. When this militia had been drilled to military efficiency, Sesostris headed them as an army for military conquest in Asia, and placed the chosen band above mentioned as officers over the different sections of the army.

Persians.—In the great days of the Persian empire, the flower of the army consisted of cavalry, who were distinguished for their bravery and impetuosity of attack. The infantry were little better than an armed mob. The war-chariots, too, though calculated to strike terror when dashing into hostile ranks, were available only on level ground. As to the numbers of men composing the great Persian A., the statements are too wild to be trustworthy. Allowing for all exaggeration, however, it is certain that the Persian A. were very large. When Darius was opposed to Alexander the Great, his army was set down at various numbers—from 750,000 to 1,000,000 men. The king was in the center, surrounded by his courtiers and body-guard; the Persians and Susians were on the left; the Syrians and Assyrians on the right. The foot-soldiers, forming the bulk of the army, and armed with pikes, axes, and maces, were formed in deep squares or masses; the horsemen were in the intervals between the squares; and on the right and left flanks; and the chariots and elephants in front.

Lacedæmonians.—The Greeks introduced many important changes in A, both in the organization and in the manœuvres. Every man, in the earlier ages of the country at least, was more or less a soldier, inured to a hard life, taught to bear arms, and expected to fight when called upon. The leading men in each state paid attention to organization and tactics in a way never before seen. It was not standing armies, but a sort of national militia, that gained Marathon, Platæa, and Mycale. So far as concerned the arrangement of A., the Lacedæmonians invented the *phalanx* (q. v.), a particular mode of grouping foot-soldiers. This phalanx consisted of eight ranks, one behind another; the front and rear ranks being composed of picked men, and the intermediate ranks of less tried soldiers. The number of men in each rank depended on the available resources of the commander. These men were mostly armed with spears, short swords, and shields.

Athenians.—The Athenians made a greater number of distinctions than the Lacedæmonians in the different kinds of troops forming their A. They had heavy infantry, constituting the men for the phalanx, and armed with spears, daggers, corslets, and shields; light infantry, employed in skirmishes and uncovering the phalanx, and armed with light javelins and shields; a sort of irregular infantry, who, with javelins, bows and arrows, and slings, harassed the enemy in march, and performed other services analogous in some degree to those of sharpshooters in a modern army. It is recorded that Miltiades, the Athenian hero at Marathon, invented the 'double-quick march,' to increase the momentum of a phalanx when rushing on the enemy.

Macedonians.—Philip of Macedon, the father of Alexander the Great, having the sagacity to see that he could not vanquish his neighbors so long as he adopted the same formation and tactics as themselves, set about inventing something new. He resolved to have a standing army instead of a militia; to have at command a set of men whose trade was fighting instead of citizens who were traders and soldiers by turn. As a further change he made the phalanx deeper and more massive than it had been among the Lacedæmonians. He brought into use the Macedonian pike, a formidable weapon 24 feet in length. With a phalanx sixteen ranks in depth, four rows of men could present the points of their long pikes protruding in front of the front rank, forming a bristling array of steel terrible to encounter. Besides these heavy infantry, there were light troops marshalled into smaller bodies for more active manœuvres. Philip organized three kinds of cavalry—heavy, armed with pikes, and defended by cuirasses of iron-mail; light, armed with lances; and irregular.

Thebans.—This nation introduced the army-formation of *columns*, much deeper than broad, or having more men in file than in rank. A new kind of tactics were introduced in accordance with this formation; the movement being intended to pierce the enemy's line at some one point, and throw them into confusion.

Romans.—These noble warriors initiated changes in army matters, which had a wide-spread influence on the nations of the civilized world. About the period 200 B.C., every Roman, from the age of 17 to 46, was liable to be called upon to serve as a soldier; the younger men were preferred; but all were available up to the middle time of life. They went through a very severe drilling and discipline, to fit them alike for marching, fighting, camping, working, carrying, and other active duties. Every year the Senate decreed the formation of *legions*, or army corps, deputing this duty to the consul or prætor. Magistrates sent up the names of eligible men, and tribunes selected a certain number from this list. See LEGION. The Roman legion, in its best days, had many excellent military qualities—great facility of movement; a power of preserving order of battle unimpaired; a quick rallying-power when forced to give way; a readiness to adapt itself to varying circumstances on the field of battle; a formidable impetuosity in attack; and a power of fighting the enemy even while retreating. The heavy infantry were armed with javelins, heavy darts, pikes, and swords; the lighter troops with bows and arrows, slings, and light javelins; while the defensive armor comprised shields, cuirasses, helmets, and greaves.

Those ancient nations which had no distinctive features in their A., need not be noticed here.

ARMIES, MEDIEVAL. The downfall of the Roman Empire marked the dividing-point between ancient and medieval times in military matters, as well as in other things that concern the existence of nations. The barbarians and semi-barbarians who attacked on all sides the once mighty but now degenerate Empire, gradually gained possession of the vast regions which had composed it. The mode in which these conquests were made gave rise to the *Feudal System* (q. v.). What all had aided to acquire by conquest, all demanded to share in proportions more or less equal. Hence arose a division of the conquered territory; lands were held from the chief by feudal tenure, almost in independent sovereignty. When European kingdoms were gradually formed out of the wrecks of the Empire, the military arrangements put on a peculiar form. The king could not maintain a standing army, for his barons or feudal chieftains were jealous of allowing him too much power. He could only strengthen himself by obtaining their aid on certain terms, or by allowing them to weaken themselves in intestine broils, to which they had always much proneness. Each baron had a small army composed of his own militia or retainers, available for battle at short notice. The contests of these small armies, sometimes combined and sometimes isolated, make up the greater part of the wars of the middle ages. Of military tactics or strategy, there was very little; the campaigns were desultory and indecisive; and the battles were gained more by individual valor than by any well-concerted plan.

One great exception to this military feudality was furnished by the *Crusades* (q. v.). So far as concerns A. however, in their organization and discipline, these expeditions effected but little. The military forces which went to the Holy Land were little better than armed mobs, upheld by fanaticism, but not at all by science or discipline. Numbers and individual bravery were left to do the work, combination and forethought being disregarded.

A much greater motive-power for change, during the middle ages, was the invention of gunpowder. When men could fight at a greater distance than before, and on a system which brought mechanism to the aid of valor, everything connected with the military art underwent a revolution. Historically, however, this great change was not very apparent until after the period usually denominated the middle ages. The art of making good cannon and hand-guns grew up gradually, like other arts; and A. long continued to depend principally on the older weapons—spears, darts, arrows, axes, maces, swords, and daggers.

During the greater part of the 14th and 15th centuries, the chief A. were those maintained by the Spaniards and the Moors on one European battle-ground, by the English and the French on another, and by the several Italian republics on a third. In those A., the cavalry were regarded as the chief arm. The knights and their horses alike were frequently covered with plate or chain armor; and the offensive weapons were lances, swords, daggers, and battle-axes. A kind of a light cavalry was sometimes formed of archers on smaller horses. As to army-formation, there was still little that could deserve the name; and there was no particular order of battle; each knight sought how he could best distinguish himself by personal valor; and to each was usually attached an

esquire, abetting him as a second during the contest. Sometimes it even happened that the fate of a battle was allowed to depend on a combat between two knights. No attempt was made until towards the close of the 15th c., to embody a system of tactics and manœuvres for cavalry; and even that attempt was of the most primitive kind. Nor was it far otherwise with the foot-soldiers; they were gradually becoming acquainted with the use of firearms; but, midway as it were between two systems, they observed neither completely; and the A. in which they served presented very little definite organization.

ARMIES, Modern. The formation of *standing* A. may be said to have introduced the modern military system. When the remarkable exploit of Jeanne d'Arc (Joan of Arc) had enabled Charles VII. to check the victorious progress of the English in France, he set about remodelling his army. By gradual changes, and amid great difficulty, he converted his ill-governed forces into a disciplined standing army. During the reign of his son, Charles VIII. (1483—1498), the consequences of this change made their appearance. Charles conducted a well-appointed army into Italy (1494), in support of some pretensions which he had to the throne of Naples.

The change made by Charles VII. was not simply that of substituting a compact standing army for an ill-organized medley of feudal troops and of mercenaries; feudalism itself gave way under the influence of this combined with other reforming agencies. So far as concerned the actual formation and discipline of the standing A. above noticed, a few changes were from time to time introduced: pistols and carbines were given to the cavalry; cuirasses were worn by the heavy troopers; and new evolutions were introduced. During the Thirty Years' War (1618—1648), Gustavus Adolphus and Wallenstein adopted opposite modes of dealing with masses of infantry: the former spread them out to a great width, and only six ranks in depth; whereas the latter adopted a narrower front, with a depth of twenty to thirty ranks. Frederick the Great, in the next century, introduced a most complicated system of tactics and drilling; insomuch that when he could manœuvre, he nearly always won his battles; but when the result depended on bold and unexpected onslaughts, he was more frequently a loser than a winner. The great military leader in the early part of the present century, Napoleon Bonaparte, made a larger use than any previous European general of the method of moving masses of troops with great celerity, beating the enemy in detail before they could combine in one spot.

It is desirable to present, in the most condensed form, a few statistics of the actual A. of Europe; leaving to future articles, under the names of the several countries, cities, and battle-fields, all details concerning special A. and military encounters.

France.—A law passed in 1872 enacts that every Frenchman, with a few specified exceptions, is liable to personal service in the army, and forbids substitution. Every Frenchman not declared unfit for military service, or specially exempted therefrom, must be for five years in the active army (composed of those who have reached the age of 20 years), for four years in the reserve of the active army, for five years in the territorial army, and for six years in the reserve of the territorial army. By the law of July 24, 1873, France is divided, for military purposes, into 18 regions, each occupied by a corps d'armée, containing 2 divisions of infantry, 1 brigade of cavalry, 1 of artillery, 1 battalion of engineers, 1 squadron of the military train. When the present reorganization is completed, the *active* army will be composed of 156 regiments of infantry (line, light, Zouaves, Algerian tirailleurs, &c.), 25 single battalions, and 293 companies (depots, &c.); making in all, for the infantry, 279,986 men; of cavalry, 67 regiments in France, 3 in Algiers, 13 depots of these regiments, and a cavalry school, comprising 67,888 men; artillery, 40 regiments and 17 companies, with 58,096 men; engineers, 4 regiments, having 13,551 men; of the military train, 11,486 men; in all, for the active army, 441,007. On the war footing this number would be increased to 1,104,735, without taking account of sanitary corps, gendarmes, &c. Including the *territorial* army, its reserve force, and the reserves of the active army, the total military force of France is 2,505,000. The effective army in 1881 was officially said to comprise 502,764 men, with 120,126 horses, including gendarmes, &c.

Germany.—By the imperial constitution, April 16, 1871, the Prussian obligation to serve in the army is extended to the whole empire. Every German capable of bearing arms is bound to be in the standing army for seven years, as a rule from the end of his twentieth to the beginning of his twenty-eighth years. Of the seven years, three must be in active service, and four in the reserve. Then he must serve for five years in the landwehr. The whole of the land forces of the empire form a united army, all the troops being bound unconditionally to obey the emperor in war and peace. The army of the German Empire consists of 18 corps d'armée; viz., the corps d'armée of the guard, 13 Prussian corps d'armée (Nos. I—XI., XIV.—comprising the troops of Baden —and XV.), the corps d'armée of Saxony (XII.), of Würtemberg (XIII), two of Bavaria (I. and II.), and the division of Hesse. In time of peace the German army has: (1) of infantry, 146 regiments of the line, 26 battalions of chasseurs, with 4687 commissioned and non-commissioned officers of the landwehr, amounting to 274,711 men; (2) cavalry, 93 regiments, containing 65,513 men; (3) artillery, 35 regiments of mounted, 13 of foot artillery, having 45,439 men; (4) engineers, 19 battalions, 9568 men. In all, with 2056 staff officers, military train, &c., 17,036 officers, 401,659 men. On the war-footing, this force is increased by the following additions: field-troops, 16,976 officers, 676,486 men; depot troops, 4431 officers, 245,793 men; garrison troops, 9599 officers, 354,247 men. Total of the German army in time of war: 33,281 officers, and 1,392,011 men; with 299,562 horses. The maximum number of troops employed by Germany in the war with France was 1,350,787 men, and 263,735 horses.

Austria.—The military forces of the Austro-Hungarian empire are divided into the standing army, the landwehr, and the landsturm. Subjects of the empire are universally liable to service. The term of service is ten years, three of which the soldier must spend in active service, being afterwards enrolled for seven years in the army of reserve. He is still further liable to serve two years in the landwehr. The regiments of the standing army are under the control of the Minister of War for the empire, while the landwehr is controlled by the Austrian and Hungarian Ministers of National Defence. The emperor-king is the supreme chief of the whole of the military and naval forces of the empire. The Austrian infantry constitutes 80 regiments of the line, with 148,480 men; of the chasseurs, 40 battalions, with 21,451 men; of the cavalry there are 41 regiments (dragoons, hussars, lancers), 43,993 men; of artillery, 13 regiments of field artillery, and 12 battalions of fortress artillery—in all, 28,695 men. The engineers and pioneers make 3 regiments, 8898 men. The sanitary troops and military train have 5748 men. The miscellaneous establishments (schools, magazines, &c.) number 25,174. In all, for the active army in time of peace, 284,435 (of whom 253,513 are combatants). On the war-footing these numbers are thus augmented: infantry, 485,680; chasseurs, 59,340; cavalry, 58,671; artillery, 70,614; engineers, 24,502; sanitary troops and military train, 45,727. Then the Austrian landwehr (infantry, chasseurs, and cavalry) comprises 3669 men in peace, 145,045 in war; and the Hungarian landwehr (the Honveds) 13,591 in peace, and 206,707 in war. The total of the Austrian military forces in peace-time is therefore 301,695; in war, 1,137,401.

Russia.—According to a law of military re-organization, the Russian forces are to be raised by annual conscription, to which all are liable who have completed their twenty-first year, and are not physically incapacitated. Substitution is prohibited. The period of service is fifteen years; six in active service, and nine in the reserve. The Russian military forces are composed of regular and irregular troops. The regular troops comprise 164 regiments of infantry, 281,012 men; cavalry, 52 regiments, 42,444 men; artillery, 33,021 men; engineers, 9819 men; train, 4617 men. Total of field troops in time of peace, 370,913. In war as follows: infantry, 568,253 men; cavalry, 47,379; artillery, 40,846; engineers, 13,306; train, 21,329—total, 691,113. With local and other troops (in fortresses, &c.), and reserve troops, the Russian army in Europe amounts, on the peace-footing, to 19,103 officers, and 508,674 men; in war, 22,871 officers, and 879,755 men. The army of the Caucasus amounts in peace to 125,643; in war, to 167,841. The army of Turkestan to 22,906; of Siberia, from 25,000 to 27,000. Besides some thousand troops as gendarmes and in various military establishments, there is a grand total for the regular Russian army of 33,000 officers and 733,000 men; on the war-footing, 39,380 officers and 1,213,259 men. In addition there are the irregular troops, comprising about 190,000 men, chiefly cavalry.

Denmark.—All able-bodied young men 21 years of age are liable to serve eight years in the regular army of Denmark, and eight years in the reserve. Denmark has 31 battalions of infantry (guards, line, reserve), comprising 26,750 men; 5 regiments of cavalry, with 2122 men; 2 regiments and 2 battalions of artillery, with 6523 men; 2 battalions of engineers with 580 men. The total, line and reserve, is 1031 officers, 35,975 men; on the war-footing, 52,656 men.

Sweden and Norway.—There are five classes of soldiers in Sweden; the enlisted troops, the national militia (indelta), the conscription troops (bevaering or landvaern), the militia of Gothland, and the volunteers. Of the soldiers of the line there is a total of 35,646 men; of the reserve (landvaern), 86,101; of the Gothland militia and volunteers, 150,830. Norway has an army of its own, divided into the troops of the line, with reserve, military train, the landvaern, the civic guards, and the landstorm. The troops of the line are 12,000 in time of peace; in time of war not more than 18,000 without the assent of the Storthing.

Holland.—The army of the Netherlands is formed partly by conscription and partly by enlistment; and there is besides a militia. The European army has, of infantry, 1122 officers and

43,690 men; cavalry, 184 officers and 4318 men; engineers, 1035 men; artillery, 421 officers and 10,610 men. With the staff, &c., the total force is 62,068 officers and men. There is besides in the East Indies a force of 27,659 officers and men.

Belgium.—The standing army is formed by conscription. Substitution is permitted. The legal period of service is eight years. Belgium has 74,000 infantry (16 regiments), 8848 cavalry (7 regiments and 2 squadrons), 14,513 artillery (6 regiments), 2486 engineers. In all, and without officers, 99,847.

Italy.—The Sardinian law of conscription forms the basis of the Italian military system. The infantry of the line under arms on the peace-footing number 86,017; the bersaglieri, 16,818; depots, 11,560; the cavalry, 18,449; the artillery, 19,732; engineers, 3027; carbineers, 20,915; administrative troops, &c., 7047; giving a total of 183,205. On the war-footing, these several forces are so increased as to give a total of 541,575; and with the addition of the provincial militia, 743,656.

Spain.—The army of Spain was reorganized in 1868 after the model of that of France. The active army has 60,000 infantry, 9000 cavalry, 2500 engineers, and 8500 artillery, making a total of 80,000 men. The reserves increase this number to 216,000. There is besides an army of 54,500 in Cuba, 9400 in Porto Rico, and of 9000 in the Philippines.

Switzerland.—The federal army has 1269 engineers, 8401 artillery, 1942 cavalry, 6078 tirailleurs, 65,991 infantry, and 364 of a sanitary corps. In all, 84,045. There are besides, of the reserves, 51,102; the landwehr, 65,562; giving a total available military force of 201,578.

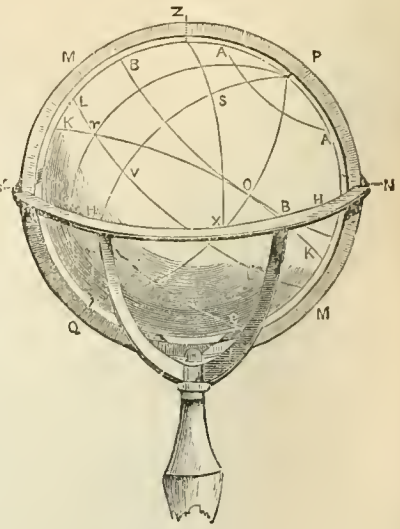
Turkey.—In 1871, the Turkish regular army had infantry to the number of 72,000; cavalry, 9000; artillery, 9500; engineers, 1600; with 1200 miscellaneous troops amounting to 93,300. The irregular (Bashi-bazouks, Spahis, &c.) are about 70,000. During the war, Turkey put on the war footing no less, apparently, than 752,000 men, including reserves and irregular troops. At the end of the war, the disorganized army consisted of less than 120,000 men. In 1880 about 150,000 men, fairly armed and equipped, were in the Turkish ranks.

United States.—At the commencement of 1861 the United States army consisted only of about 14,000 regular troops. In various successive levies by the president during the civil war (1861—1865), as many as 2,653,062 men had been called out—nearly one-fourth of the entire population of the Northern States. After the war, the standing army was steadily diminished; and by a law passed in 1870, it is provided that there shall be no more than 30,000 enlisted men at one time. That force is distributed amongst 25 regiments of infantry, 10 of cavalry, 5 of artillery, and 1 battalion of engineers. Besides the regular army there is the militia, of which the nominal strength was at the last census, 3,245,000. See UNITED STATES ARMY in AM. SUPP.

A separate and fuller treatment of the army of Great Britain is reserved for BRITISH ARMY; and for that in our Indian possessions see EAST INDIA ARMY. All the various matters relating to the formation, organization, discipline, arms, equipments, duties, and tactics of A., will be found succinctly treated under appropriate headings.

ARMI'LLARY SPHERE (*armilla*, a ring), an instrument intended to give a just conception of the constitution of the heavens, and of the motions of the heavenly bodies, as seen by an observer on the earth. It consists of a number of rings fixed together so as to represent the principal circles of the celestial sphere, and these are movable round the polar axis within a meridian and horizon, as in the ordinary celestial globe. It was by means of such rings furnished with sights that Hipparchus, Ptolemy, and other ancient astronomers made many of their observations, and we find even Tycho Brahé making most of his planetary observations with the help of such an instrument. The A. S., is however, now only used as an aid to instruction in astronomy, and in this respect is generally supplanted by the celestial globe. The object aimed at in the A. S. will be better understood by reference to the celestial globe represented in the diagram. Supposing the observer on the earth to be in the center of the sphere, the earth on which he stands shuts out from his view the lower half of the heavens, or the part lying below the horizon HH. The hemisphere above him may be regarded as divided into two equal portions, an eastern and a western, by the meridian MM, which passes through the pole P, and the zenith Z, of which the eastern half is shown in the figure.

The north pole is supposed to be elevated above the horizon, and its elevation is measured by the arc NP, or the height above the north point; and the heavens appear to rotate round an axis PQ, of which P is one extremity; the south pole, Q, the other extremity, being below the horizon. The meridian MM, and the horizon HH, are the only circles which maintain a fixed position with regard to the observer. Of the other leading celestial circles, the equator or equinoctial LL, extending from the east to the west point of the horizon, the tropics of Cancer and Capricorn, respectively BB and CC, and the arctic circle AA, although rotating with the stars, maintain the same position with regard to the horizon; while the ecliptic, KK, is constantly changing its inclination and position towards it. Circles which extend from pole to pole, cutting the equator at right angles, are called circles of declination. The circle which passes through the vernal equinox ♈ (see ARIES), is denominated the equinoctial colure; and that passing through the summer solstice O (see SOLSTICE), the solstitial colure. The circles just named, together with the Antarctic Circle, are represented by corresponding rings in the A. S. If S be a star, the following are the names given to the arcs which determine its position with regard to these circles: ♈V Right ascension; SV, Declination; SP, Polar distance; SZ, Zenith distance; XS, Altitude; (XN + 180°), Azimuth, reckoned from the south pole westward.



ARMI'NIUS, JACOBUS, the founder of Arminianism, was born at Oudewater (Old Water) in 1560. His real name in Dutch was James Harmensen; but in accordance with the prevailing custom amongst scholars in those days, he Latinized it. His father was a cutler, and died when A. was a child. After a preliminary education at Utrecht, he commenced (in 1575) a course of study at the newly founded university of Leyden, where he remained for six years, and where he seems to have acquired a high reputation, for the Amsterdam merchants undertook to bear the expense of his further studies for the ministry, on condition that he would not preach out of their city unless permitted to do so. In 1582, he went to Geneva, and received the instructions of Theodore Beza, the most rigid of Calvinists. Here he made himself odius by the boldness with which he defended the logic of Peter Ramus, in opposition to that of the Aristotelians of Geneva and in consequence had to retire to Basle, whither his fame must have preceded him, for he was offered by the faculty of Divinity in that university the degree of doctor gratis, which, however, he did not venture to accept, on account of his youth. At Basle he studied under Gyrnæus. He subsequently (1586) traveled into Italy. On his return to Amsterdam (1588), he was appointed minister. Shortly after this, he was commissioned to defend the doctrine of Beza, regarding predestination, against the changes which the ministers of Delft had proposed to make on it. A. carefully examined both sides of the question, but the result of his study was, that he himself began to doubt, and at last came to adopt the opinions he had been commissioned to confute. Some time after this change of view, he came, in the course of his expositions, upon the Epistle to the Romans, the most explicitly doctrinal in the New Testament, and the 8th and 9th chapters of which have always been considered the strongholds of Calvinism. His treatment of this epistle excited much dissatisfaction, and involved him in sharp disputes with his orthodox brethren. Still his views were, as yet, either ambiguously or vaguely expressed, or, at least, had not attained to that clear consistency they subsequently acquired, for in 1604 he was made professor of theology in the university of Leyden.

The greatest enemy of A. was Francis Gomar, his colleague in the university of Leyden. In the course of the year 1604, the latter attacked his doctrines, and from that hour to the end of his life, A. was engaged in a series of bitter disputes with his opponents. The *odium theologicum* was never exhibited in more unmingled purity. Arminius asserted, in substance, that God bestows forgiveness and eternal life on all who repent of their sins and believe in Christ; he wills that all men should attain salvation, and only because he has from eternity foreseen the belief or unbelief of individuals, has he from eternity determined the fate of each. On the other hand, Gomar and his party, appealing to the Belgic Confession and the Heidelberg Catechism, maintained, that God had, by an eternal decree, predestinated what persons shall, as being elected to salvation, be therefore awakened to repentance and faith and by grace made to persevere therein; and what persons shall, as being rejected (*reprobati*), be left to sin, to unbelief, and to perdition. See PREDESTINATION, PERSEVERANCE OF SAINTS.

While these fierce disputes were continuing, A., who was not destitute either of friends or influence, was created *rector magnificus* of the university, but resigned the honor on the 8th of February 1606, having held the office only for one year. All the pulpits in Holland now fulminated against him. At length, in 1608, A. himself applied to the states of Holland to convoke a synod for the purpose of settling the controversy; but, worn out with care and disease, he died, on the 19th of October 1609, before it was held, leaving seven sons and two daughters by his wife, Elizabeth Reael, daughter of Laurent Reael, a judge and senator of Amsterdam.

There can be no doubt that A. himself was much less Arminian than his followers. He had not matured his opinions sufficiently to elaborate a complete system of anti-Calvinistic doctrine, though it is perfectly certain that the conclusions at which his disciples arrived—as stated in the famous 'Five Articles'—are the logical and legitimate results of his teaching. He always complained, however, that his opinions were misrepresented; but this is invariably the fate of controversialists, and the penalty of controversy. A. was an extremely good man, as even his enemies allow; his abilities were also of a high order; his thinking is clear, bold, and vigorous; his style remarkably methodical, and his scholarship respectable, if not profound.

After the death of A., his followers gained strength, and boldly asserted their views, but still remained in a minority. In 1610, they presented to the assembled states of the province of Holland a 'Remonstrance'—from which they were styled 'Remonstrants'—which contained the following propositions: 1. That God had indeed made an eternal decree, but only on the conditional terms that all who believe in Christ shall be saved, while all who refuse to believe must perish; so that predestination is only conditional. 2. That Christ died for all men, but that none except believers are really saved by his death. The intention, in other words, is universal, but the efficacy may be restricted by unbelief. 3. That no man is of himself able to exercise a saving faith, but must be born again of God in Christ through the Holy Spirit. 4. That without the grace of God, man can neither think, will, nor do anything good; yet that grace does not act in men in an irresistible way. 5. That believers are able, by the aid of the Holy Spirit, victoriously to resist sin; but that the question of the possibility of a fall from grace must be determined by a further examination of the Scriptures on this point.

This last point, left as an open question, was decided by the Remonstrants in the affirmative soon afterwards (1611). Whereupon the Gomarists (Calvinists) put forth a strong 'Counter-remonstrance,' asserting plainly absolute predestination and reprobation. After several fruitless discussions, the states of Holland, in January 1614, acting under the advice of Oldenbarneveld, a senator, and the learned Hugo Grotius, issued an edict of full toleration of both parties, prohibiting at the same time the continuance of the controversy. The Counter-remonstrants (or Calvinists) refused to submit to this edict, and the strife soon became so furious, that in 1617, or soon afterwards, the Arminians found it necessary to guard themselves from personal violence by appointing a safeguard of militia-men (*Waardgelders*). The controversy now merged in the strife of party politics. The ambitious Maurice of Orange took advantage of the passions of the majority to crush his opponents of the republican party, whose leaders were adherents of the Arminian doctrines. Several Arminians were put to death—among them the aged senator Oldenbarneveld, May 13, 1619—while Grotius and others were imprisoned. In these circumstances, the Synod of Dort was held (1618—1619), attended by selected representatives from the Netherlands, England, Scotland, the Palatinate, Switzerland, Nassau, East Friesland, and Bremen. From this convocation (January 14, 1619), the thirteen Arminian pastors, with the learned and eloquent Simon Episcopius at their head, were excluded. The doctrines of the Counter-remonstrants were embodied in ninety-three canons; the Belgic Confession and the Heidelberg Catechism were confirmed as authorities for the reformed churches of the Netherlands; and three hundred Arminians (chiefly preachers) were expelled from office. In consequence of this decision, the defeated party sought shelter in France, Holstein, England, &c. Afterwards, under Frederick-Henry, the stadt-holder after Prince Maurice (1630), they were again tolerated in Holland, and in 1634 Episcopus opened his theological college in Amsterdam.

Since that time, the Remonstrants (or Arminians) in Holland have inclined more and more towards freedom of thought on religious questions and independence in church government. The rejection of all creeds and confessions; the free interpretation of the Scriptures; a preference of moral to doctrinal teaching; Arian views respecting the Trinity; the virtual rejection of the doctrines of original sin and imputed righteousness, and the view of the sacraments as merely edifying forms or ceremonies: all these and other points of belief display the same tendency which is found in their church polity. Their annual conference on ecclesiastical affairs is composed of ministers and lay-deputies, and takes place in June, alternately at Amsterdam and Rotterdam. The number of Remonstrants is now only about 5000, and is still decreasing. In 1809, they had 34 congregations with 40 preachers in Holland; but in 1880, only about 20 congregations. The largest society of Arminians is in Rotterdam, and numbers only 600 members.

Although the Arminians are thus dwindling away as a distinct body, their tenets respecting predestination have been adopted with greater or less modification by several other Christian denominations (see METHODISTS, BAPTISTS); as well as by multitudes of the individual members of those churches whose formularies are Calvinistic (see CALVINISM). They are also very prevalent in the Church of Rome.

A'RMISTICE, a suspension of hostilities between two armies, or two nations at war, by mutual agreement. It sometimes takes place when both are exhausted, and at other times when an endeavor to form a treaty of peace is being made. A particular example will best illustrate the nature of an A. On the 25th of February 1856, the representatives of England, France, Austria, Prussia, Sardinia, Turkey, and Russia, met in congress at Paris, to consider the terms of a treaty of peace which should terminate the war at that time going on between five of the above-named powers. The British nation was very unwilling to suspend hostilities during the sitting of the congress—partly on account of the numerous failures of diplomacy in the preceding year, and partly because Russia was suspected of only wishing to gain time. It was agreed, however, at the first sitting, in conformity with the laws of nations and the usages of war, that an A. should be declared, to be announced by telegraphic message to the commanders in the Crimea, and to last until the 31st of March. During that period of about one calendar month, the hostile armies were to remain strictly at peace, but the fleets of the allies were to continue their blockade of Russian ports. The information reached the generals late on the 28th of February. On the morning of the 29th, a white flag was hoisted in the Russian camp outside Sebastopol; several Russian officers assembled around it; and a glittering cavalcade of British, French, and Sardinian officers proceeded thither. The accredited officers compared notes, found the terms of the A. clear, agreed on a boundary-line between the hitherto hostile forces, and formally gave pledges for a cessation of fighting. The courtesy of civilized nations at once succeeded to the horrors of war; the Russian commander gave a magnificent entertainment to the allied commanders, and was entertained in turn; the soldiers 'fraternized,' by little gifts of tobacco, and ludicrous attempts at conversation, across a small stream which formed part of the boundary-line; and a few British officers were permitted to make excursions into the interior of the Crimea. The A. ended on March 31, not by a renewal of hostilities, but by the signing of a treaty of peace.

ARMO'RICA, the country of the Armorici, i. e., 'the dwellers on the sea' (Celt. *ar*, on or near; and *mor*, sea), the name by which the people occupying the coast of Gaul between the Seine and the Loire were known to Cæsar. At a later period, the name A. was confined to the country afterwards styled Britannia Minor, or Bretagne (q. v.).

A'RMORY may mean a storehouse for arms; but the name is also often applied to a collection of ancient armor and weapons—such as those in the Tower of London, in Sir Samuel Meyrick's mansion at Goodrich Court on the Wye, and in Warwick Castle.

A'RMOR is a general name for the apparatus for personal defence, as contradistinguished from arms or weapons of offence. Little of it is worn by soldiers at the present day, seeing that hand-to-hand conflicts, in which it is especially serviceable, are rather exceptional in modern warfare. It was before the invention of gunpowder that A.—often called in England by the name of *harness*—was especially used.

All the ancient nations who occupy a place in history were accustomed to adopt one or other of the defensive clothing or implements which collectively come under the denomination of A. Leather-A. was sometimes worn; but brass, iron, and other metals were preferred. Some of the more luxurious leaders had much silver and gold in their A. In the Bible, shields, helmets, breast-plates, and greaves, are mentioned among the articles of A. borne or worn by the Israelites and their opponents. The classical writers—Homer, Xenophon, Herodotus, Livy, Tacitus, Varro, &c.—supply abundant evidence of the use of A. among the nations concerning whom they wrote.

It is believed that the early Britons bore little or no other A. than shields. The Anglo-Saxons were more fully provided. At different times before the Norman Conquest they appeared to have had four-cornered helmets; laricæ made of leather; scale-A.; leathern helmets; wooden shields covered with leather; sheep-skin shields; conical caps or helmets of metal; pectorals or neck-guards; breast-guards of undressed hide; flat-ringed A.; byrnes or tunics of overlapping pieces of leather; close-fitting cuirasses of leather, and sometimes of strong linen; leg-guards of twisted woollen cloth; shields of various sizes, from half a yard to a yard and a

half in length; and casques having more or less resemblance to the ancient helmets. When the Danes were in Britain, they had at first no other A. than leathern neck-pieces, which descended some way over the shoulders and chest; and greaves or shin-pieces for the legs. In the time of Canute or Knute, however, they adopted a kind of A. which Sir Samuel Meyrick supposes them to have borrowed from the Norsemen or Norwegians. It comprised a tunic, with a hood and long sleeves; pantaloons with covered feet as well as legs; and sugar-loaf shaped helmets or skull-caps, with attached pieces which hid nearly the whole face except the eyes. All these were probably made of leather; but most of the surfaces were strengthened by macles or mascles, a perforated net-work of steel.

With William the Conqueror came in the kinds of A. which were at that time prevalent among the knights and soldiers of the continent of Europe, and which became afterwards more or less combined with the A. previously known in England. William himself occasionally wore a hauberk of ring-A. This kind of A. was much worn during his reign, the rings being usually attached to a foundation of leather. One curious variety of ring-A., called the haubergeon, had the tunic and breeches all in one piece. The helmets were generally conical, with a nasal or nose guard descending from the front.

A distinct ring-A., called *hose*, was often worn on the legs. The shield was generally kite-shaped, unlike the oval shields carried by the Anglo-Saxons. Gradual changes in these various portions of A. were made between the reigns of William Rufus and John. Under Henry III., we find stitched and padded hauberks and chaussés, called 'ouvrages de pourpointerie; suits of ring-A; greaves or shin-pieces of steel; poleyns or knee-guards; vambraces or arm-guards; jacks, jaques, or jackets, made of leather, and worn over the ring-A.; interlaced ring-A., of oriental invention, not requiring to be stitched to any garment or foundation; helmets, visors, and skull-caps of various forms; and chanfrons, or A. for the head and face of horses. During Edward III.'s reign, iron plate-A. was much used by troopers, in the various forms of helmet, breast-plate, gauntlet, and greaves. In the 14th c., chain-mail fell into disuse, and was succeeded by plate-A.; this last-named kind became more and more complicated, and reached its greatest pitch of elaboration in the reign of Richard III. During the times of Henry VII. and VIII., the A. was sometimes fluted, often elaborately engraved, and even damascened or inlaid with gold. Under James I., the knightly ideas of the feudal times gave way, and the use of A. declined; a knight armed *cap-à-pie* was a rarity. Charles I. tried to revive its use, but he had few followers; and the days of Cromwell may be regarded as the last in which A. was worn to any considerable extent by the regular soldiers. Helmets and cuirasses are still worn by the three regiments of Household Cavalry (Life-guards and Horse-guards), but more for show than for service. The chief pieces of A. will be found briefly described and illustrated under the proper headings.

Suit of Armor.
presented by the Emperor Maximilian to Henry VIII.

A'RMORER. The old meaning of this word has nearly passed away with the system to which it belonged. The armor-smiths, or makers of armor, were among the most skilful workers in metal during the feudal times; but their trade afterwards fell away. In the year 1690, the workmen-armorers of London, in a petition to parliament, complained that their trade was well-nigh ruined.

Armorers, in a somewhat different sense of the word, belong to the British army and navy at the present time. There are armorers to every regiment, not to make armor, but to repair arms. There is one to each regiment of cavalry, and one to each battalion of infantry and brigade of artillery. The A. is paid 4*s.* 11*d.* a day, besides a small allowance for certain work performed. There is a school for training 'A.-sergeants' at the Small Arms Factory, Enfield, where the men work, after enlistment, until drafted to a regiment; and whither they return from time to time to refresh their mechanical memories.

On shipboard, the A. is a first-class petty officer, who has, under the gunner, charge of all the muskets, pistols, cutlasses, boarding-pikes, &c., which he is expected to keep clean and in ready order. He is assisted by certain seamen called the 'A.'s crew;' and all are skilled in the general routine of smith's work.

A'RMOR-PLATES. The employment of thick slabs of iron to protect the sides of ships of war and the fronts of fortifications, is quite a recent invention; or rather, the modern system is the practical realization of plans suggested long ago by Mersenne and others. In 1842, Mr. Balmano of New York proposed that war-ships should be clad with several thicknesses of iron plate, riveted one upon another, the plates being individually ¾th inch thick. Soon afterwards, Mr. Stevens, an American shipbuilder, made further suggestions on the same subject, and other practical men kept the matter before the attention of the authorities in various countries. In 1854, the French sent several floating-batteries to the Black Sea, clad with iron plates; and the English Admiralty hastily imitated this example, producing eight very slow and unmanageable batteries in 1855—1856. Then came in a flood of suggestions for arming our regular ships of war in a similar way. The Admiralty, dismayed at the thought of dismantling the existing fleet, which had cost so much, delayed the subject as long as they could, but without abandoning it. In 1860, the French sent to sea *La Gloire*, a timber-built ship of war, altered from a 90-gun three-decker to a 40-gun corvette, clad with 4½-inch iron plates, having a burden of 3000 tons. This proceeding at once set the English government on the alert; they saw that further delay would be imprudent, and they set about the creation of an armor-clad navy. Many problems had to be solved—whether to case old wooden ships; or to build new vessels, of which the hull as well as the armor should be of iron. Then arose further problems—how near the bulwarks should the armor-plates come, how near the bottom of the vessel, how near the stem and stern; also, what thickness of iron, and whether the same thickness in every part.

In 1865 the 'Iron-Plate Committee' reported, as the conclusion to which their experiments had determined them, that the best material for ship armor was wrought-iron of the softest and toughest quality. All the British armored men-of-war built between 1860 and 1876 are 'iron-clads,' plated solely with iron, to the exclusion of all steel, and in that period the thickness of the plates had increased from 4½ inches to 14 inches, the weight of the plates increasing proportionately from 4—5 tons to 20—25 tons. The first 'steel-faced' plates used were on the turrets of the *Inflexible;* steel plate of 9 inches thick, forming the outside, iron plate of 7 inches thick the back layer, a slab of strong teak being interposed 'sandwich fashion' between the two. The *Colossus* and *Majestic* of the first class of armor-ships constructed since 1881, are plated wholly of steel. The *Agamemnon* and *Ajax*, of the second class, are steel-faced. The cruising turret-ship, *Impérieuse*, has 4 barbette turrets and an outer casing of wood. The 50 (or so) 'efficient' iron-clads of which, exclusive of three or four for the colonies and about 20 'inefficient,' the British armor-clad fleet of war consists, are divided into five classes, according to streugth of armor and armament and modes of construction. The *Inflexible*, the first British man-of-war, though considerably short of the weight of the *Duilio* and *Dandolo* of Italy, has a weight of armor amounting to 3155 tons.

The citadel in the center, 110 feet long, 75 feet broad, and 12 feet deep, one half above, one half below water, is surrounded by rectangular walls (inclosing engines, boilers, base of turrets, hydraulic loading-gear, magazines, &c.) 41 inches thick, consisting of armor-plates varying in thickness from 16 inches to 24 inches, with an interstratification of strong teak and a backing of the same wood—the whole forming a 'rectangular armed castle.' The other five turret-ships of the first class are built on much the same plan, but not so large nor of equal thickness of armor, the plate of the *Dreadnought* being 14 inches thick, that of the *Devastation* and *Thunderer* from 12 to 14 inches thick, and that of the *Colossus* and *Majestic* from 16 to 18 inches. Of the third class, comprising 16 rigged ships especially adapted for cruising and foreign service, the *Monarch*, a rigged turret-ship, has armor-plate of 8 inches thick along the water-line, a 10-inch plate over the port-holes, and an 8-inch over the rest of each of its two turrets. Each of the four vessels of the fourth class, 225 feet long and 45 feet beam, has its hull protected by an armor-belt 7 feet wide running in two strakes, the upper 8 inches thick, the lower 6 inches thick amidships, tapering fore and aft. The breastwork surmounting the hull, 117 feet by 14 feet, has a plating of 6 feet 6 inches thick and from 8 to 9 inches thick. The ships of the fifth class, mostly converted line-of-battle ships, were successively condemned from 1876 to 1879. Of some 20 armor-ships of the Italian navy, two of the first class, the *Duilio* and *Dandolo*, are armored with steel-plate of the surpassing thickness throughout of 22 inches. The deck passage at bow and stern, 4½ feet above the water-line, is also sheathed by horizontal armor against either water or projectile. The still more gigantic men-of-war, the *Italia* and *Lepanto*, have a panoply of three feet thickness throughout. The two largest French iron-clads, the *Devastation* and the *Foudroyant*, are plated to a thickness of 14 inches throughout; while Germany's *Kaiser* and *Deutschland* have a 10-inch armor-mail throughout.

Since 1860, experiments have been conducted by our government at home, as by foreign governments abroad, to determine

the conditions of the utmost practicable resisting power in ship-armor, and the utmost practicable destructive power in ship artillery, experiments causing a constant enlargement of cannon and constant thickening of armor-plate. The experiments (so far as England is concerned) have been conducted principally at Shoeburyness, but also on board the *Thunderer* at Portsmouth.

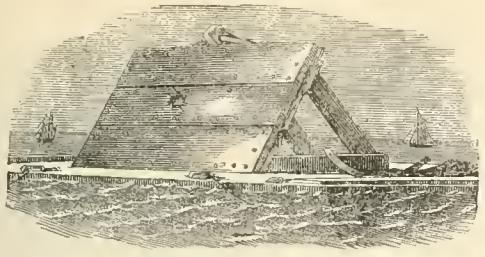


Fig. 1.—Front View of *Warrior* Target, after practice with 600-pounder Armstrong Gun.

The usual mode is, to construct a target in all respects tallying with the armed side of one of our iron-clads, and then to try to pierce it with shot fired from guns at various distances. A *Warrior* target, for instance, consisting of a 4½-inch armor-plate, backed by 18 inches of teak, and an inner skin of ⅝-inch iron; while a *Lord Warden* target had 4½ inches plate, 30 inches teak, and 1½ inch skin. In early experiments on the *Warrior* target, Alderson's steel shell, Armstrong's conical shell, and Palliser's chilled-

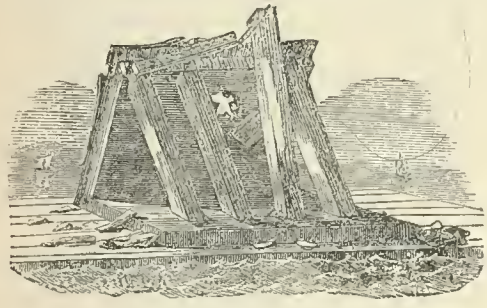

Fig. 2.—Back View of do.

iron shell were fired at it from a 7-inch gun at 200 yards: the Palliser shot excelled the others, going clean through the target, armor and all, and bursting behind. On another occasion, a Palliser 115-lb. shot went through the target even at an angle of 30° from the perpendicular.

The advantage contemplated in the 'sandwich fashion' of armor-plating adopted in the case of the *Inflexible* and other ships was, in addition to the increased defensive power implied in the increased thickness of plating, that broader and larger plates of practicable weight could by this means be produced, and that higher excellence of workmanship could be insured to thinner plates, than to plates of 20 inches and upwards of thickness. The Italian Admiralty tested on an unprecedented scale the relatively defensive properties of iron and steel armor, in 1876, and decided on the adoption of steel armor, the *Duilio* and *Dandolo* thus being the first steel-plated ships.

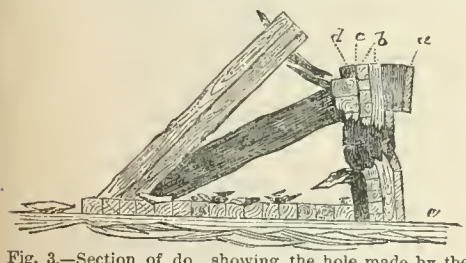

Fig. 3.—Section of do., showing the hole made by the 600-lb. shell, and displacement of the upper plate:
a, armor plating, 4½ in. thick (displaced); *b*, teak backing, 18 in. thick; *c*, boiler-plate skin, ⅜ in. thick; *d*, wrought-iron beams; *e*, platform.

The next move in armor-plating was with a view to combining the superior resistance to perforation characterizing hard steel with the superior resistance to cracking possessed by tough rolled iron; and 'steel-faced' armor—with a front-plate of steel and a back-plate of rolled iron—attained precedence of iron in English war-ships. The hard steel-plate in front resists perforation better than iron, breaking up the projectiles, or rendering them unavailing, while the steel and iron plate does not crack as would steel alone. For thicknesses up to twelve inches, a steel-faced plate, it is calculated possesses as much resistance to perforation, in case of normal impact (or straight charge), as an iron-plate from 25 to 30 per cent. thicker and heavier; and in case of oblique impact, the superiority of the steel-faced over the iron plate is still greater, glancing projectiles at angles of obliquity at which mere iron would be 'bitten' into. At Spezzia, again, in Nov. 1882, three targets were erected, the armor-plate on each 11 feet × 8½ × 19 inches; one, a steel-faced plate made by Messrs. Cammell; another steel-plate made by Messrs. Brown; a third, a steel-plate made at Creusot—all of them being backed, each by four feet of oak. The Creusot steel-plate was fastened by 20 bolts; the two steel-faced plates by only 6 bolts each. A 2000 lb. chilled cast-iron projectile having been hurled on each of them from a 100-ton muzzle-loading gun by a powder-charge of 329 lbs., the perforations were as follows: 3½ to 5 inches in the steel-faced plates; 8½ inches in the steel-plate.

The steel-plate did not crack at first shot. The powder charge being next increased to 480 lbs., the Creusot steel-plate was split into six pieces, but its bolts still held them in position, whereas each of the two steel-faced plates was broken into five pieces, which fell to the ground, leaving the target exposed. It was therefore to be inferred that a larger number of bolts were needed for a given area of steel or steel-faced plate than had been previously supposed. With even the lighter of the above two charges, a 19-inch iron-plate would have been completely perforated. Iron, though thus demonstrated to be inferior to steel-faced plate for the protection of the sides and batteries of ships, is found to be of superior value for plates of not above 3 to 4 inches thick used for the sheathing of decks.

Armor-clad forts are also attracting attention. Iron has been used largely in the defences of Plymouth and Portsmouth. In 1864, a line of iron-clad forts was built up at Shoeburyness, to test several modes of construction.

Regarded as articles of manufacture, armor-plates were at first produced mainly by hammering, several thicknesses of iron being welded one upon another, at a white-heat, by blows of a ponderous steam-hammer; but it is now more customary to produce them by rolling than by hammering—pressure being considered to produce more satisfactory results than percussion.

ARMS, or weapons of offence, may be divided into two great classes—those that act by means of gunpowder, and those that do not. Of arms that act otherwise than by explosion, the greater part have been in use from the earliest times; they include the bow and arrow, sling, pike, spear, lance, dart, javelin, dagger, axe, mace, spiked or knotted club, scythe for chariots, dirk, bayonet, sword, cutlass, &c., together with such artillery as the ballista, catapulta, and battering-ram. Weapons depending on the use of gunpowder are of two kinds—those that can be held in the hand, and those that are too heavy to be portable. In the first class, we find the names of the hand-cannon, hand-gun, arquebus, haquebut, demi-haque, matchlock, wheel-lock, firelock, currier, snaphaunce, caliver, escopette, petronel, dragon, hand-mortar, dag, tricker-lock, carbine, fusil, fowlingpiece, blunderbuss, pistol, musket or musquet, musketoon, rifle, &c. In the second class, more usually included under the name of artillery, we find the springel, war-wolf, bombard, cart-of-war, culverin, demi-culverin, serpentine, falcon, saker, cannon, howitzer, petard, carronade, mortar, rifled cannon, war-rockets, &c. The more important of these are briefly noticed under the proper headings. It is needless, perhaps, to add that nine-tenths of these are utterly obsolete.

The Surveyor-general of the Ordnance in the British army has the duty of providing and keeping efficient the arms in use by the regular and auxiliary forces, and of maintaining an ample reserve in the Royal Arsenals. Each regiment makes a report on these subjects yearly. If the commanding officer of a regiment ascertains that a new supply of arms is needed for the men under him, or a supply of anything in relation to the arms, he indents upon the Controller of the District for the supply required; which is forthwith made by that officer, subject, however, to a pecuniary fine upon the regiment, if the arms have not lasted a fair time.

ARMS, ARMO'RIAL BEARINGS, or ENSIGNS, are the names given to such devices as when painted on a shield form a coat. These terms in popular speech include all the accompaniments of a shield—viz., the crest, helmet, and where such exist, the supporters, &c. See these terms, and HERALDRY.

ARMS, ASSUMPTIVE. See HERALDRY.

ARMS, BELLS OF, are tents, mostly of a conical shape, for containing the small-arms for each company in a regiment of infantry. The tent is frequently painted with the color of the facings of the regimental uniforms.

ARMS, MESSENGER AT. See MESSENGERS-AT-ARMS.

ARMS, SERJEANT AT. See SERJEANT-AT-ARMS.

ARMS, STAND OF. A stand of A. is the complete set necessary for the equipment of one soldier, whether horse or foot.

A'RMSTRONG, JOHN, physician and poet, was born about 1709 at Castletown, a pastoral parish in Roxburghshire, of which

his father was minister. He studied medicine at the university of Edinburgh, where he took the degree of M.D., February 4, 1732. Soon after he commenced practice in London, and became known by the publication of several fugitive pieces and medical essays. In 1737 he published a very objectionable poem, *The Economy of Love*, which injured his reputation for a time. His principal work, *The Art of Preserving Health*, a didatic poem in blank verse, extending through four books, appeared in 1744. In 1746 he was appointed physician to the hospital for sick and lame soldiers. In 1751 he published a volume on *Benevolence;* in 1753, a poetical epistle on *Taste;* and in 1758, a volume of prose essays of no great merit. In 1760 he was appointed physician to the forces in Germany. In 1761 appeared from his pen *Day, a Poem*. On the peace in 1763, he returned to London, and resumed practice. In 1771 he made a continental tour with Fuseli, the painter, an account of which he published, with the title of *A Short Ramble through some Parts of France and Italy, by Lancelot Temple, Esq.* His last work was a volume of medical essays. He contributed to Thomson's *Castle of Indolence* the four stanzas at the end of the first part, descriptive of the diseases resulting from sloth. Died 7th September, 1779. A. was the friend of Thomson, Mallet, Aaron Hill, Dr. Young, Wilkes, and the principal wits and literary men of the period. He seems to have been a reserved, indolent, and splenetic man, 'who quite detested talk;' kind-hearted withal, and of frugal habits, having left £3000 saved out of a small and precarious income. His fame rests entirely on *The Art of Preserving Health*, his other works being now only known by name.

A'RMSTRONG, JOHN, an eminent physician and medical writer, was born 8th May, 1784, at Ayres Quay, near Bishop-Wearmouth, where his father was the superintendent of some glassworks. He studied medicine at the University of Edinburgh, and in June 1808 took the degree of M.D. He commenced practice at Bishop-Wearmouth, and in 1811 was chosen physician to the infirmary at Sunderland. In 1816 he published a work on *Typhus*, which greatly extended his reputation. His researches concerning the cause and phenomena of febrile diseases having made his name well known in the metropolis, he was induced in February 1818, to remove to London, where his practice became extensive, and he was elected physician to the Fever Hospital. In 1821, in concert with Mr. Edward Grainger, he established a medical school in Webb Street, Borough, where he lectured on the practice of physic. He also delivered a course of lectures on Materia Medica. In 1826 he joined Dr. Boot and Mr. E. Bennett in establishing a new school of medicine in Dean Street, Soho, but shortly after relinquished his connection with it. He died of consumption, 12th December, 1829, aged 45. Exclusively devoted to the duties of his profession, Dr. A. was very successful in the elucidation of medical science. His works are numerous, and he contributed various papers to the medical journals. His lectures, inserted in the *Lancet* in 1825, were published in a separate form after his death, with the following title: *Lectures on the Morbid Anatomy, Nature, and Treatment of Acute and Chronic Diseases, by the late John Armstrong, M.D. Edited by Joseph Rix*—one of his pupils. (London, 1834, 8vo.)

A'RMSTRONG, SIR WILLIAM GEORGE, noted for various mechanical inventions, especially in artillery and in water-power machinery, was born 1810 at Newcastle, where his father was an eminent corn-merchant, and in 1851 filled the office of mayor. A. was educated at the school of Bishop-Auckland; but his peculiar mental powers were chiefly cultivated by the opportunities which his father's tastes gave him at home, of acquainting himself with chemistry, electricity and mechanics. Though the natural bent of his mind was to some profession in which these sciences would have been available, he readily yielded to his father's wishes, and was articled to Mr. Armourer Donkin, an eminent solicitor in Newcastle, who, at the expiration of his time, adopted him as a partner. A high sense of duty enabled A. to give his excellent general powers of mind to business; but he devoted much of his leisure to his favorite pursuits, and his inventive faculty was constantly active. About 1838, observing one day a little stream descending along a height near Newcastle, and driving but a single mill, he thought to how much more purpose it might be applied hydraulically, and thus was led into a course of experimenting, which resulted in his producing a much improved hydraulic engine, of which a description was given in the *Mechanics' Magazine* for April 18, 1840.

Following up this invention with a view to practical applications, he gave to the world, in 1845, a hydraulic crane, which has proved to be of eminent utility in raising weights at harbors and in warehouses. The discovery of electricity in steam by a workman at a fixed engine on the Cramlington Railway in 1840, had meanwhile led A. into a new path, and in 1842 he brought to perfection an apparatus for producing electricity from steam, which was soon after introduced into the Polytechnic Institution in London. The evolution of the electricity depending in reality on the friction sustained by the small quantity of water which accompanies the steam in its discharge, the great merit of A.'s invention in this case lay in the form he gave the orifice through which the steam passed. This and other inventions brought him into prominent notice; he was elected a member of the Royal Society in 1846; and, shortly afterwards, in conjunction with some friends, commenced the Elswick Engine-works, in the suburbs of his native town. This establishment is upon a large scale, at first chiefly employed in producing hydraulic cranes, engines, accumulators, and bridges, for use in Great Britain, the continent, and India, but now embracing also works for the production of ordnance.

In 1854, while war was raging in the Crimea, the War Office was solicited by many inventors to make trial of new forms of cannon and projectiles. Mr. Armstrong, one of the number, attracted the attention of the authorities, and was employed to make explosive apparatus for blowing up the ships sunk at Sebastopol. This led him soon afterwards to consider improvements in ordnance, and he devised a form of breech-loading cannon, combining many peculiarities in structure and action. He received encouragement to make a few field-pieces on his new method. He made lengthened experiments on the strength of iron and steel, on the relative merits of cast and wrought iron, on the best number of grooves in rifling, on the best pitch or twist for these grooves, on the most convenient modes of loading at the breech of the gun, on the mechanism for lessening the recoil, on the best form and structure of shot and shells, and on the fuses best suited for igniting the shells during their flight.

Most of the early experiments were made with guns throwing 6-lb. and 18-lb. shot and shells, and subsequently 32-lb. shells. The last-named gun was built up piecemeal, to avoid flaws or faults, and to insure strength, lightness, and durability. It was made in 3-feet lengths. Bars of wrought-iron, 2 inches wide, were heated to whiteness, twisted spirally round a steel bar or core, and welded; other bars were twisted over these in a similar way, but with an opposite turn of the spiral; a third, and perhaps a fourth were added, according to the thickness and strength needed. Another heating to whiteness preceded a thorough welding of all the layers of bars by a steam-hammer. The ends of two of these 3-feet pieces were then nicely trimmed and adjusted, placed in contact, and bound together by the enormous pressure of a wrought-iron ring shrunk on while at a white heat. By varying the number and length of these sections, a gun of any length could be made.

The core was then removed, and the bore of the gun rifled by exquisite machinery. The rifle-grooves were so small and close as to be upwards of 40 in number; their pitch or twist such as to make a complete circuit in a gun 10 feet long. The breech of the gun was wholly distinct, and constructed in a different way; it could be drawn backward by unscrewing, and had a hole through its center for introducing the shot or shell and the charge. At first, the inventor adopted a steel interior for his gun; but afterwards relied on the toughest wrought-iron. The projectile employed with this gun might be solid shot, shell, case-shot, or canister-shot; but the shell was that to which most interest is attached. It was about three diameters in length; and thus a 32-lb. shot or shell could be fired from a gun of much smaller calibre than if it were spherical. The shell was built up of abont 50 separate pieces of cast-iron, very accurately fitted, and enveloped in an iron sheath. Outside of it were two bands of lead, soft enough to be forced into the rifled grooves of the gun, and thus to acquire the rotatory movement by which the straightness of flight is so much insured.

The actual results obtained by a gun such as is above described were almost incredible. An ordinary long 32-pounder weighs 57 cwt.; Armstrong's 32-pounder weighs 26 cwt. The former requires 10 lb. of powder as a charge; for the latter 5 lb. will suffice. The former will send a shot or shell 3000 yards; the range of the latter exceeds 9000 yards. The fuses attached to the shells are so exquisitely adjusted that the shell can be made to burst either directly on leaving the gun, or half-way on its path, or when it strikes an object; in the last-named case, even a sack of shavings will afford the necessary concussion; and yet, so close is the structure, that an uncharged shell has been fired completely through 9 feet of solid oak without the pieces separating. A.'s elaborate experiments were made chiefly with a 6-pounder, 1¾ inch calibre, and so light that two men could carry it (without its carriage); this small gun could reach 1500 yards with wonderful accuracy of aim, and had a range of 3000 at a certain elevation.

When A. had spent much of his time and thoughts during four years on this subject, the government, supported by the strongly expressed opinions of artillery officers of all ranks, proposed to secure the result of these experiments for the nation. A. offered to the government, without any stipulation, not only all his past inventions, but also all such as he might hereafter discover. This led to arrangements which the ministers in parliament characterized as liberal and patriotic on his part; and the terms thus suggested were accepted. An office was created for him, that of Chief-engineer of Rifled Ordnance, for seven years provisionally;

and a certain amount of salary was determined on, in consideration at once of his past inventions and of his future services. He was knighted by the queen in 1858.

The peculiar connection, partaking in some degree of the nature of a partnership, between the government and the Elswick firm, underwent changes from time to time, and was brought to a close in 1863. During its continuance, guns of gradually increasing power were made on A.'s system; 3, 5, and 12 pounders; then 18, 20, 32, and 40 pounders; then rapidly increasing in calibre, until at length a 600-pounder was produced, weighing upwards of 20 tons. The coil system of construction, the adoption of a large number of rifle grooves, and the use of the beautifully formed segment shell, were continued; but A. made variations in the combination of steel and iron, and adopted muzzle-loading for many of his larger guns. Elaborate experiments made by the War Office led to a conclusion that the A. breech-loader has many disadvantages for large ordnance. Notwithstanding its range, accuracy, power of working in a small space, easiness to clean, and safety to the gunners while loading, it is neither so cheap nor so simple as the muzzle-loader; it is difficult to handle, complicated, apt to get out of order, and not so useful for general purposes. The comparative cheapness has had much to do with the preference of the War Office for the Woolwich gun, a muzzle-loader. A. supplies, and has long supplied many foreign governments with his guns, chiefly of large calibre. The manufacture is of the highest order, effected through the medium of machine tools of exquisite construction; but the practical utility of the gun, as compared with the Whitworth, Palliser, and other kinds, is still matter of controversy.

The great reputation and commercial success of A. depend on his skill as a constructor of water-power machinery. Early in his career, in 1847, when a plan was adopted for supplying Newcastle with water, he suggested that the power derived from the descent of the water through pipes from the reservoir, should be utilized for working hydraulic cranes on the quay, and for various mechanical purposes in the town; this was done with marked success. The system has rapidly grown; until, at length, the A. hydraulic machinery is largely adopted in England and abroad for raising, lowering, hauling, and other purposes in connection with railways, canals, docks, piers, harbors, lock-gates, manufactories, warehouses, &c. The fabrication of the machinery employs a very large number of hands at Elswick, where the works are carried on by a joint-stock company. A., who belongs to several scientific societies, was in 1863 elected president of the British Association; he was instrumental in bringing about the appointment of the Coal Commission in 1866. He has also taken an active part in the inquiries concerning the operation of the Patent Laws. Cambridge and Oxford have conferred honorary degrees on A., who is a member of several foreign knightly orders.

ARMY. Referring to ARMIES (ANCIENT, MEDIEVAL, and MODERN) and to BRITISH ARMY for brief historical notices of national military forces, and leaving to other portions of this work all details concerning the formation and tactics of such forces, it may be well to mention here certain distinctions in the application of the name A. A *Covering A.* is encamped or in cantonments, for the protection of the different passes or roads which lead to the town or place to be protected. A *Siege A.* is ranged around or in front of a fortified place, to capture it by a regular process of besieging. A *Blockading A.*, either independent of or auxiliary to a siege A., is intended to prevent all ingress and egress at the streets or gates of a besieged place. An *A. of Observation* takes up an advanced position, and by celerity of movement keeps a close watch on all the manœuvres of the enemy. An *A. of Reconnaissance* has a more special duty at a particular time and place, to ascertain the strength and position of the enemy's forces. A *Flying A.* comprises a strong body of horse and foot, moving quickly, to alarm the enemy, and to protect garrisons.

ARMY ADMINISTRATION. The whole of the operations connected with the raising, clothing, paying, maintaining, and controlling of the British army, are included in the term A. A. They are distinct matters from military command and discipline. The Sovereign has the supreme command of the British army; but the Secretary of State for War is her responsible representative in all that concerns administration—the Commander-in-chief being her representative in matters relating to military command and discipline. The Secretary is the organ through whom the wishes of the Sovereign are reconciled with the wishes and intentions of parliament. Until the war with Russia in 1854, the administrative departments were much scattered; but now they are all consolidated under the Secretary of State for War. See WAR DEPARTMENT.

ARMY DISCIPLINE. Military law is now consolidated in the Army Discipline and Regulation Act of 1879, which, under the heads of (1) discipline, (2) enlistment, (3) billeting and impressment of carriages, (4) general provisions, (5) application of military law, incorporates the main provisions of the Mutiny Acts (q. v.), and the Articles of War (q. v.), and is independent of an annual continuance act.

ARMY ESTIMATES. In the spring of every year, the British government having formed a plan concerning the extent and appliances of the military force for that year, the War Office sends to the Treasury a series of accounts setting forth the probable cost of everything required. These accounts are called the A. E. If they are approved by the Treasury, the Chancellor of the Exchequer adverts to these, along with other estimates, in his annual 'financial statement,' made to the House of Commons in his capacity as guardian of the public purse. In preparing the A. E. the Secretary of State for War applies to the heads of all the departments under him for detailed accounts of their probable requirements. Another functionary then incorporates and adjusts these into a whole; they are submitted to the Treasury; and, if approved, are presented to the House as the A. E. Should the Commons grant the money, the Accountant-general of the War Office makes the requisite drafts or demands from time to time; and the Treasury authorizes the Paymaster-general of the Forces to honor these drafts. The money itself is in the Bank of England; this establishment receives a certain annual sum from the government for managing such financial matters.

The A. E. are drawn up in conformity with a model which differs little from year to year. There are certain great headings, each comprising many minor divisions: viz., 1. *Regular Forces* (4 votes); 2. *Auxiliary and Reserve Forces* (4 votes); 3. *Ordnance Establishments and Manufactures, and Purchases of Stores* (4 votes); 4. *Works and Buildings* (barracks, fortifications, &c.); 5. *Educational Establishments* (schools, libraries, &c.); 6. *Administration of the Army;* 7. *Non-effective Services* (half-pay, retiring allowances, pensions, &c.). The various items are more or less sifted by the House of Commons; and any one or more of them can be refused altogether, or granted in diminished amount. The A. E. for 1879—1880, which may be cited here as an illustrative example, refer to the period from April 1, 1879 to March 31, 1880. The total number of men, including the staff of the Militia Forces, on the Home and Colonial Establishment of the Army, and exclusive of those serving in India, was 135,625. The total number serving in India was 62,653, which are charged against the Indian Treasury. The horses were 26,218, of which 10,830 were for India service. Without going into any details, we will simply give the amounts under the six great headings:

1. Regular Forces—pay and allowances	£4,944,200
2. Auxiliary and Reserve Forces	1,258,500
3. Ordnance Services (provisions, clothing, arms, stores)	5,531,000
4. Works and Building	853,300
5. Various Services (education, administration, &c.)	432,900
6. Non-effective Services	2,625,800
	£15,645,700

ARMY LIST is the name of a publication issued monthly by authority of the War Office. It contains the names of all commissioned officers in the British army. Then come the general and field officers of the dying-out Indian Army. Next the names of all officers who hold military honors or staff appointments. The bulk of the work, however, is taken up with an enumeration of all the regiments in the Queen's army, and all the officers in each regiment, arranged according to the numerical rank of the regiments. To this are added lists of the officers of the Rifle Brigade, Colonial Corps, Royal Artillery, Royal Engineers, Royal Marines, Control, and Army Medical Department; and of officers retired on full-pay and on half-pay. Next follow the officers of the Militia, Yeomanry, and Volunteers; and then the Militia and Volunteer officers of the several colonies. A full index, an obituary, a list of the changes gazetted during the past month, and of the new regulations, complete the work. A larger work of similar but non-official character, *Hart's A. L.*, by a more condensed arrangement of type, gives all the information contained in the official list, and much in addition.

ARMY SCHOOLS. The colleges, academies, and schools relating to military matters in this country may be grouped into three classes—those intended to increase the military efficiency of the officers and men; those for imparting military knowledge to persons not yet in military service; and those which bear relation to the ordinary school-tuition of soldiers of the ranks and their children. The principal of those in the first group are the Staff College, the Royal Military College at Sandhurst, the School of Military Engineering at Chatham, the Department of Artillery Studies at Woolwich, the School of Gunnery at Shoebury, the School of Musketry at Hythe, and the Royal Artillery Institution at Woolwich. The second group is represented by the Royal Military Academy at Woolwich; while in the third are the Royal Military Asylum (better known as the Duke of York's School) at Chelsea, the Royal Hibernian School at Dublin, the Regimental Schools, and the Garrison Schools. Chelsea Hospital is an asylum for veterans, not a school of instruction. See MILITARY ACADEMY, MILITARY SCHOOLS, SANDHURST, &c.

ARMY WORKS CORPS. When the British generals engaged in the Crimean war, in the later months of 1854, knew that the siege-army would need to winter outside Sebastopol, grave difficulties were presented to their notice. The distance from the landing-place at Balaklava to the front of the siege-camp was not less than eight miles; and the only road was a mud-track, almost impassable in wet weather. How to get the heavy guns, the shot and shell, the provisions, and the general stores, up to the front, was a question not easy of solution. The British soldiers were too few even for the ordinary military duties, and yet they were called upon for services of an extra and arduous nature. When these facts became known in England, a suggestion was made that an 'Army Works Corps' should be formed, to consist of strong and efficient railway excavators, Cornish miners, and well-sinkers; that these should have with them all the tools and appliances for making roads and digging wells; and that they should be accompanied by traveling workshops and skilled artisans, to effect that which might require more skill than physical labor. The immediate necessities of Lord Raglan, in regard to bringing up supplies, were met by the construction of a railway from Balaklava to the heights outside Sebastopol, by special contract with Messrs. Peto and Brassey; but the large amount of bodily labor continually needed for various services, led to the formation of the A. W. C. The raising and organization of this force were entrusted to Sir Joseph Paxton. As soon as he had obtained 1000 efficient men, he sent them out; and their value was so soon felt by Lord Raglan, that other detachments gradually followed, until the corps comprised 3500 men in the later months of 1855. The men were paid well, and they worked well; and as their engagement related only to the special duties connected with the siege-camp, the country was not saddled with any burden after the need for these services had ceased. They did not require to be drilled for their duties, like sappers; and they were ready for work at once, as artisans or laborers. There were some cases of disagreement between the men and their employers, after the whole of the British had returned from the Crimea, in a matter of wages due; but this was a question of detail, and did not affect the usefulness of the corps. The experience was valuable, as showing the relative advantage and disadvantage of employing civilian laborers in military operations. As one result, it may be observed that the military authorities have been careful not to repeat the experiment in later wars.

ARNAULD, Angélique, a daughter of Robert Arnauld d'Andilly, was born on the 28th November 1624. From her earliest years, she exhibited an extraordinary force and resoluteness of character, and excited much anxious speculation concerning her future career among her relatives. When not quite twenty years of age, she became a nun at Port-Royal des Champs, where she had been educated by her aunt, Marie Jaqueline Angélique Arnauld, sister of the great Arnauld. Nine years after, she was made subprioress; and on removing some years later to Port-Royal de Paris, she held the same office. During the persecution of the Port-Royalists, A. A., by her piety and courage, sustained the spirit of the sisterhood. The whole family, male and female, were determined Jansenists, and none more so than Mother Angélique de Saint-Jean (her conventual name). She had much to endure, but she met misfortunes with earnest intrepidity. A royal order was issued to break up the nunnery. The police arrested the inmates, who were dispersed in various convents throughout France, and constant efforts were made by the Jesuits to induce them to sign the 'Formulary of Alexander VII.' A. A. was alone exempted from listening to their arguments and solicitations, her 'obstinacy' being supposed invincible. At length, by command of the Archbishop of Paris, the nuns were restored to Port-Royal des Champs; but for some years they were subjected to a strict surveillance by soldiers, who watched all their movements, and allowed them no intercourse with persons out of the convent. In 1669, however, was issued the edict of Clement IX. for the peace of the church, which was a kind of compromise on this vexed question of Jansenism and Jesuitism. The nuns received back the privileges of which they had been stripped, and constituted their society anew. A. A. was again elected prioress. In 1678, she was made abbess. The next year, her protectress, the Duchesse de Longueville, died, and the persecution recommenced, by the prohibition to receive any more novices. Still Angélique did not despair. She consoled the nuns, and exerted all her influence with persons in power, but with little effect. At last she sank under a complication of griefs, and expired on the 29th of January 1684, leaving behind her as bright and beautiful a memory as any of her countrywomen. She was learned without being pedantic, pious without bigotry, and gentle to others in proportion as she was severe to herself. A. A. wrote several works, the most valuable of which is *Mémoires pour servir à la Vie de la Mère Marie Angélique Arnauld de Sainte Madeleine, Réformatrice de Port-Royal.*

ARNAULD, Antoine, the greatest advocate of his time in France, was born at Paris in 1560. He was descended from an ancient family of Auvergne, which had distinguished itself both in civil and military affairs. A. was not less remarkable for his eloquence than for his probity. His zealous defence of the university of Paris against the Jesuits in 1594 won for him a wide celebrity. It was reprinted in 1717. He published another work against the Society of Jesus, and several tractates of an earnest political character. The Jesuits accused him of being a Huguenot, but the accusation was unfounded, for he had no personal predilection in favor of Protestantism as a distinct religious system. He had several children, who formed the nucleus of the Jansenists and Port-Royalists. He died 29th December 1619.

ARNAULD, Antoine, known as 'the great A.,' the twentieth and youngest son of the preceding, was born at Paris, February 6, 1612. Although originally intended for the bar, he could not conceal his dislike of the legal profession, and was in consequence dedicated by his mother to the service of the church. Entering the Sorbonne, he became a pupil of Lescot, the confessor of Cardinal Richelieu, and afterwards Bishop of Chartres. Lescot initiated him into the scholastic theology; but his attention having been drawn to the writings of Augustine, he soon conceived an admiration for that profoundest of the early Christian thinkers which he ever after retained. It was Augustine, he himself admitted, who first showed him the great difference between the two states—that of a nature whole and sound, and that of a nature corrupted by sin. In 1641, the Sorbonne wished to receive him into their society, on account of his extraordinary piety and talents, but Cardinal Richelieu opposed this. In the following year he was ordained a priest, and in 1643 he published a work entitled *De la Fréquente Communion*, which was received in the most favorable manner by all except the Jesuits, who had taken alarm at the virtues of A., and were already attempting to defame one whom they instinctively felt to be a reproach to their order. As a consequence of this publication, he was now admitted 'of the Society' of the Sorbonne. A. not only replied to the aspersions of the Jesuits in his *Avertissement*, but also sent forth a work which was the prelude to a long and fierce contest with his adversaries, *Théologie Morale des Jésuites* (Moral Theology of the Jesuits). But the hatred of the latter was not confined to literary libels; they advised the chancellor of the Sorbonne to carry the dispute to Rome, whither A. would be obliged to follow and defend himself. In this scheme, however, they were defeated.

A. now buried himself in seclusion for twenty-one years, during which period, however, his pen was almost continuously active. In 1644 appeared his *Tradition de l'Eglise sur la Pénitence* (Opinion of the Church on the doctrine of Penitence). It was a reply to the attacks which the Jesuits had made against his *Frequent Communion*. A. was still entangled in the disputes which arose out of this treatise, when he became involved in another controversy that colored the whole of his subsequent career, and may be said to have won for him his position in history. In 1640 had appeared a posthumous work of Jansenius, Bishop of Ypres, entitled *Augustinus; seu Doctrina Sancti Augustini de Humanæ Naturæ Sanctitiate, Ægritudine, Medicinâ, adversus Pelagianos et Massilienses.* It laid down with a rigor equal to that of Calvin the doctrines of predestination, the corruption of human nature, and the depravity of the will. It was specially intended as a counteractive against the lax principles and morality of the Jesuits, many of whom, and especially their great champion, Molina, entertained extreme Pelagian views of the freedom of the human will, which they had cunningly interwoven into their 'scarlet-colored' web of ethics. The work, in the meantime, was condemned by Pope Urban VIII., on the 1st of August 1641. A., who quickly apprehended its vital importance in the existing state of things, boldly ventured to defend it against the censures of the papal bull. He published several pamphlets, closing with a first and second *Apologie de Jansénius.* It is to the honor of the religion of A., however, that it was not always controversial. Whenever a moment of armistice was permitted him, he occupied it in writing such works as *Mœurs de l'Eglise Catholique, La Correction, La Grâce, La Vérité de la Religion, De la Foi, de l'Espérance, et de la Charité*, and the *Manuel de Saint Augustine.* He also varied these occupations by translating into Latin his *Frequent Communion*, and by his composition of his *Novæ Objectiones contra Renat. Descartis Meditationes*, and several smaller tractates. In addition to his literary labors, he undertook the direction of the nuns of Port Royal des Champs, a convent of which his sister, Marie Jaqueline Angélique Arnauld, was abbess. In this retreat he was surrounded by many friends, thirsting like himself for the quiet pleasures of study, some of whom have left their mark in the world, such as Pascal, Nicole, &c. Here they wrote in common numerous excellent works. A. executed parts of the *Grammaire Générale Raisonnée, Eléments de Géométrie*, and *L'Art de Penser.* In 1649 the Jansenist controversy broke out more fiercely than ever. The *Augustinus* of the Bishop of Ypres was again attacked and condemned by the Sorbonne and the pope. A. replied in his *Considérations.* In 1650 appeared what he conceived to be his best work, *L'Apologie pour les Saints Pères.*

For the next half-dozen years he was engaged in constant and

painful disputes; yet, in spite of the polemical character of his life, the impression of his piety and earnestness was deepened in the mind of the nation; and on reading some of his compositions, even Alexander VII. is reported to have praised the author, and to have exhorted him for the future to despise the libels of his adversaries. During the strife he published *La Concorde des Evangiles* and *L'Office du Saint-Sacrement*. In 1655—56, for prudential reasons, he left his retreat at Port-Royal; about the time he was expelled from the Sorbonne and the faculty of theology.

In 1656, the war with the Jesuits was renewed—not, however, by A. in person. An unknown knight with closed visor had ridden into the list—the great Pascal. Under the *nom de plume* of Louis de Montalto, he discharged his scorpion wit against the Jesuits for about a year and a half in the *Provincial Letters*. A. furnished him with materials; but, in 1658, he took the field *in propriâ personâ*, by publishing his *Cinq Ecrits en faveur des Curés de Paris contre les Casuistes relâchés*. In 1662 appeared *La Nouvelle Hérésie* (of the Jesuits); in 1669 the first volume of his *Morale Pratique* (of the Jesuits), the last of which was not published until the year of his death.

A., who was a sincere Catholic after his fashion, next had a theological controversy, properly so called, with the reformed minister Claude, the consequence of which was his volume, *Du Renversement de la Morale de J. C. par la Doctrine des Calvinistes touchant la Justification* (1672). In 1675 he returned to the subject in his *Impiété de la Morale des Calvinistes*. Some years previous to this, A. had enjoyed the peace of Clement IX., which put a stop for the time to the Jansenist controversy. He had been presented to the papal nuncio and to the *Grand Monarque*, both of whom flattered him highly; but the Jesuits, who could not breathe freely in his presence, used their utmost efforts to prejudice Louis against him, and at last the king issued an order for his arrest. A. hid himself for some time, but finally withdrew into Belgium. He felt his exile keenly, though honored by many learned and influential persons, and could not rest in one city, but wandered from place to place, ever displaying the same astonishing vigor of mind and the same polemical tendency. It is strange that this man, who was celebrated amongst his friends for equanimity and gentleness of heart, should have been so bitter in his controversies, even with his friends, for he wrote not against his enemies only, but against Pascal, Domat, Nicole, his protector, Pope Innocent XI., and his old friend Père Malebranche. So earnest was he for the truth—which earnestness had no doubt been greatly intensified by persecution and controversy—that he could never thoroughly realize the idea, that there might be truth on the other side also. He died at Brussels, 8th August 1694. His works, which amount to upwards of 100 volumes, were published at Paris, 1775—1783.

ARNAULD, Robert d'Andilly, the eldest son of Antoine Arnauld, the advocate, and brother of the great Arnauld, was born at Paris in 1588. He was a person of considerable consequence at the French court, where his influence was ever exerted beneficially. Balzac spoke very highly of him. At the age of fifty-five, he quitted the bustle of the world for the solitude of Port-Royal des Champs, where he devoted himself to religious history and biography. His chief works are translations, such as those of the *Confessions of St. Augustine*, and of the *History of the Jews*, by Josephus. The latter work is esteemed more elegant than accurate, however. In 1668, appeared his translation of the *Lives of the Holy Fathers of the Desert, and of several Saints;* and in 1670, that of the works of St. Theresa. He was likewise the author of some pieces of religious verse. He died 27th September, 1674.

ARND, or ARNDT, Johann, a German Protestant divine, born at Ballenstadt, in Anhalt, in 1555, became Lutheran pastor at Quedlinburg, Brunswick, and elsewhere, and died at Celle, Hanover, in 1621. As a man he was remarkable for his piety and active benevolence; but he is chiefly known for a work entitled *True Christianity* (Wahres Christenthum), which was translated into most European languages, and is yet popular in Germany. Its object is 'edification'—the promotion of practical religion; and it is written with great warmth and unction, and in a strain of piety bordering on mysticism. It has been called the Protestant à Kempis, and its author the Fenelon of the Protestant Church. There is an English translation by W. Jaques (Lond., 1815, 2 vols.).

ARNDT, Ernst Moritz, professor in the university of Bonn, and for half a century one of the leading political writers of Germany, was born in the island of Rügen in 1769. He gave up the clerical profession, for which he was at first intended, and after traveling over great part of Europe, became, in 1806, Professor of History in Greifswald. Here, among other writings, he published his *History of Serfdom in Pomerania*, for which he was formally denounced and accused by several nobles. In his *Spirit of the Times* (Altenb. 1807), he attacked Napoleon with such boldness, that, after the battle of Jena, he had to take refuge in Stockholm. Returning under a feigned name, he resumed his functions at Greifswald in 1810; but war becoming imminent, he resigned the following year, and became an active co-operator with the minister Von Stein, and other patriots, in throwing off the foreign yoke. His numerous fugitive writings, full of energy and fire, contributed not a little to rouse and sustain the spirit of Germany for the war of liberation. His best poems belong to this period, and several of them have become national songs. (A new selection, Leip. 1850). His song, *What is the German's Fatherland?* is sung wherever German is spoken. In 1818 he was made professor of modern history in the new university of Bonn, but became involved in 1819 in the prosecutions for what were called 'demagogic movements,' and was suspended.

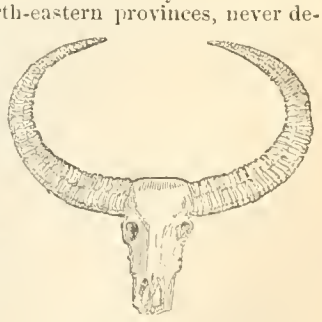
Though acquitted on trial, he was made to retire, retaining his salary. After twenty years' suspension, he was restored in 1840. His writings are numerous: we may mention his *Beschreibung und Geschichte der Schottländ. Inseln*, &c. (Leip. 1826); a collection of his fugitive *Schriften für und an meine lieben Deutschen* (3 vols. Leip. 1845); and *Erinnerungen aus dem äussern Leben* (3d ed. Leip. 1842). He was elected a member of the German national assembly in 1848, but seceded from it along with the whole Gagern (q.v.) party in 1849. He powerfully supported the party who advocated a constitutional hereditary monarchy, and took a prominent part in the appointment of the Archduke John as regent, and in the fruitless deputation to Berlin to offer the empire to the king of Prussia. After the dissolution of the Frankfort Assembly, A. did not cease in his fugitive writings to advocate the views of the German national party. He died 29th January 1860.

ARNE, Thomas Augustine, Doctor in Music, one of the best and most genial of English composers, was born in London, 1710, and received his early education at Eton. His father, who was an upholsterer, intended to educate him for the bar; but the love of music was too strong to be restrained. Young A. became skilful as a violin-player, forming his style chiefly on the model of Corelli; and his zeal in the study of music induced his sister (afterwards celebrated as Mrs. Cibber) to cultivate her excellent voice. He wrote for her a part in his first opera, *Rosamond*, which was first performed with great success in 1733. Next followed his comic operetta, *Tom Thumb, or the Opera of Operas;* and afterwards his *Comus* (1738), which displayed greater cultivation of style. He married a singer, Cecilia Young (1740); and after a successful visit to Ireland, was engaged as composer to Drury Lane Theatre, and wrote many vocal pieces for the Vauxhall concerts. The national air, *Rule Britannia*, which was originally given in a popular performance, *The Masque of Alfred*, was of his composition. He composed also two oratorios, the opera *Eliza*, and another, *Artaxerxes*, in the Italian style; but his genius was better adapted to simple pastoral melody than to great dramatic compositions. He died in London, 1778.

ARNEE, or ARNA, the largest animal of the ox kind yet

Arnee:—[From an Indian picture.]

known. It is a native of India, and is found chiefly in the forests of the Himalayas and in the north-eastern provinces, never descending to the low plains. It is usually regarded by naturalists as a wild variety of the buffalo; but Mr. Vasey thinks 'our information on the subject not yet sufficiently precise to determine this point.' It is named *Bos Arnee*, as a distinct species, by some authors. A pair of horns in the British Museum measure more than six feet each along the outer curve. When the head of an A. is placed with the muzzle on the ground, it requires the outstretched arms of a man to hold the points of the horns. From the manner in which the A. is introduced in Indian paintings, it would seem to have been sometimes tamed.



Skull and Horns of Arnee.

A'RNHEIM, or ARNHEM, the Roman Arenacum, capital of the province of Guelderland, in Holland, with a population of (1879) 40,978, is situated on the right bank of the Rhine, which is here crossed by a bridge of boats; it has a considerable transit-trade between Amsterdam and Germany. The environs of this strongly fortified town are exceedingly picturesque. Among its most remarkable buildings are the Reformed Dutch Church, which contains monuments of the Dukes of Guelderland; and the town-house, noted for the grotesque adornment of its front, which has gained it the name of Duivelshuis. There are several paper-mills in the neighborhood. Here Sir Philip Sidney died in 1586, after the battle of Zutphen. In 1813, A. was taken by storm by the Prussians, under General Bulow, and the way thus prepared for the occupation of Holland.

A'RNHEM LAND, a name formerly applied to a region in North Australia, so called from the ship of the Dutch navigators who discovered it in 1618.

A'RNICA, a genus of plants belonging to the natural order *Compositæ*, sub-order *Corymbiferæ*. The flowers of the ray are female and ligulate, those of the disk hermaphrodite and tubular. The receptacle is naked; the pappus hairy. The root, leaves, and flowers of the Mountain A. (*A. montana*), sometimes called Mountain Tobacco, are much valued in medicine, and administered in various forms as a stimulant in paralytic affections, typhoid fevers, and other diseases. They are also applied with much benefit to bruises, to promote the reabsorption of extravasated blood. They contain a peculiar volatile oil, a resin, an extractive matter, and an alkaloid (*Arnicina*). The root is perennial, and crooked, the stem about two feet high, simple or little branched, with few leaves, bearing on the summit a head of flowers of a dark golden yellow, often two inches in breadth. It flowers from June to August, forms an ornament of mountain meadows in Germany and Switzerland, and is found upon the continent as far south as Portugal, and as far north as Lapland, but is not a native of Britain.

Arnica montana.

A'RNIM, ELIZABETH VON, better known as Bettina, wife of Ludwig Achim von Arnim (q.v.), was born in 1785 at Frankfort-on-the-Main. From her childhood excitable and eccentric, an early and profound impression was made upon her mind by the suicide of her friend, the Canoness von Gunderode The next great event of her life was her devoted attachment to, and intimacy with Goethe, at that time a man of nearly sixty. Their correspondence, entitled *Goethe's Letters to a Child*, was published in 1835, and translated by Bettina into English. Her letters are poetical, graceful, and fascinating, though often careless and extravagant, and abound in graphic sketches of men of the time. Goethe turned many of these letters into verse. Bettina's later works were semi-political in their character, and like her earlier, full of fantastic beauty. She lived to a good old age, dying in 1859.

A'RNIM, KARL OTTO LUDWIG VON, a well-known writer of travels and other works, was born at Berlin 1779. After studying at Halle and Göttingen, he traveled at different times over the most of Europe, and was employed on the embassies at Stockholm and London. His *Flüchtige Bemerkungen eines flüchtigen Reisenden* (Passing Remarks by a Passing Traveler, 6 vols., Berl. 1837—1850), is recommended for its clear elegant style, as contrasted with the lumbering and involved writing of the 'Academic' school. A. also wrote in English *Napoleon's Conduct towards Prussia* (Lond. 1814), and published *German National Melodies*, with German and English text (Lond. 1816). He was the author of a play and several poems. He died in 1861.

A'RNIM, LUDWIG ACHIM VON, a fantastic but original German writer of romances, was born in Berlin, January 26, 1781. After devoting some years to the study of the physical sciences, he began his career as an imaginative author with *Ariel's Revelations*, a romance which, though based on the principles of the new poetic school which had then risen in Germany, indicated, nevertheless, that the author could strike out a way of his own. His travels through Germany afforded him an opportunity of catching the pecularities of popular life in its various provincial manifestations. He was especially interested in the old popular poetry, and stirred up among his countrymen a warmer sympathy for it by the publication, along with Clemens Brentand, of *The Boy's Wonderhorn* (Heidelberg, 1806—1808). In 1809 appeared the *Winter Garden*, a collection of novels; in 1810, the romance, entitled *The Poverty Riches, Guilt, and Repentance of the Countess Dolores;* in 1811 *Halle and Jerusalem, the Sports of a Student, and the Adventures of a Pilgrim*, in which last his humor took a very saucy turn. In 1817, he published the *Crown Guardians*, a work characterized by its originality, richness of fancy, and vivid potraitures. The later years of his life were spent partly in Berlin and partly at his estate near Dahme, where he died, Jan. 21, 1831.

A'RNO, next to the Tiber the most considerable river of Central Italy, rises on Mount Falterona, an offset of the Apennines, at an elevation of 4444 feet above the level of the sea, and 25 miles north of Arezzo. It flows through the deep fertile valley of Casentino, in a south-east direction; enters the richly cultivated plain of Arezzo, where it receives the water of the Chiana; and then flows in a north-west and north course through the upper valley of the A. (*Valdarno*), one of the most delicious parts of Tuscany; afterwards it receives the Sieve, its largest tributary, and turns its course toward the west, flowing past Florence, Empoli, and through the town of Pisa. The whole length of its course is about 140 miles. In old times, the embouchure of the A. was at Pisa; now it is about four or five miles distant, in lat. 43° 41′ N., and long. 10° 15′ E. It is navigable for barges as far up as Florence, but in the summer season even this frequently becomes impossible. The Italian poets speak of 'the golden A.;' but, in truth, its waters have mostly the unpleasant color of milk and coffee mixed together. The A. is noted for the rapid and destructive character of its inundations. The most memorable are those of September 1537, when the whole of the Valdarno was laid under water, which rose to the height of 8 feet in some parts of Florence; and 1740, the latter being caused by the long continuance of the sirocco, which completely melted the snows on the Apennines.

A'RNOLD, or ARNALD, OF BRESCIA, was a native of that town, and was distinguished by the success with which he contended against the corruptions of the clergy in the early part of the 12th c. He was educated in France under Abelard, and adopted the monastic life. By his preaching, the people of his native place were exasperated against their bishop, and the fermentation and insurrectionary spirit spread over a great part of the country, when he was cited before the second Lateran Council, and banished from Italy. He retired to France, but experienced the bitter hostility of St. Bernard, who denounced him as a violent enemy to the church. He thereupon took refuge in Zurich, where he settled for several years. Meanwhile his doctrines exerted a powerful influence in Rome, which ended in a general insurrection against the government, whereupon A. repaired thither, and endeavored to lead and direct the movement. He exhorted the people to organize a government similar to the ancient Roman republic, with its consuls, tribunes, and equestrian order. But they, provoked by the treachery and opposition of the papal party, and disunited among themselves, gave way to the grossest excesses. The city, indeed, continued for ten years in a state of agitation and disorder. Lucius II. was killed by the populace in an insurrection in 1145, and Eugenius III., to escape a similar fate, fled into France. These violent struggles were subdued by Pope Hadrian IV., who feeling the weakness of his temporal authority, turned to the spiritual, and resorted to the extreme measure of laying the city under excommunication, when A., whose party became discouraged, and fell to pieces, took refuge with certain influential friends in Campania. On the arrival of the emperor, Frederick I., for his coronation, in 1155, A. was arrested, brought to Rome, tried, hanged, his body burned, and the ashes thrown into the Tiber.

A'RNOLD, JOHANN, a miller of Neumark, who lived in the time of Frederick II. of Prussia, and gave rise to a remarkable legal process. He complained to the king that his landlord, by making a pond, had taken away water from the mill; that he (A.) had therefore refused to pay rent for the mill, of which he held a lease; but had been condemned to pay by the unanimous decisions of two legal courts. The king took up the case, and regarding as an oppression of the poor, reversed the decisions of the courts, dismissed his high-chancellor, imprisoned several other officers of justice, and gave orders that restitution should be made to the miller. Soon afterwards, the king died, and under Frederick William II. the case was more coolly investigated, when the result was, that the condemned chancellor and other official persons were exonerated from all blame in the matter, and the miller was recompensed by the state for loss of time and money.

A'RNOLD, MATTHEW, a living English poet, the eldest son of the late Dr. Arnold of Rugby, was born 24th December 1822, and educated at Winchester and Rugby. In 1840 he was elected scholar of Balliol College, Oxford; in 1844 he obtained the Newdigate prize; and in 1845 he was elected a fellow of Oriel College. In 1851 he was appointed one of Her Majesty's Inspectors of

British Schools. In 1857 he was elected Professor of Poetry at Oxford, and in 1859—1860 was sent to the continent by the English government as assistant to the Commissioners appointed to inquire into the state of education in France, Germany, and Holland. In 1865 he again visited the continent on a like mission. A. holds the honorary degrees of Edinburgh and Oxford, and Italian order.

Mr. A. was first known as a poet of classic taste and exquisite purity of imagination, but of late years he has almost exclusively betaken himself to prose. His chief productions in verse are *Poems* (1853), containing, among other fine pieces, *Sohrab and Rustum*, *Tristram and Yseult*, *Balder*, and *Merope* (1858), an attempt to naturalize in English literature the form of the Greek drama; and *New Poems* (1867). His prose writings are growing numerous. Among the chief are his lectures on *Translating Homer* (1861); his *Report on Education in France, Germany, and Holland* (1861); *A French Eton or Middle-class Education and the State* (1864); *Essays on Criticism* (1865); *Lectures on the Study of Celtic Literature* (1867); *Schools and Universities of the Continent* (1868); *Culture and Anarchy, an Essay in Political and Social Criticism* (1869); and *Higher Schools and Universities in Germany* (1874). In *St. Paul and Protestantism* (1871), and still more in *Literature and Dogma* (1872), he startled the public by his piercing and audacious application of literary criticism to religion. In 1875, he published *God and the Bible;* in 1877, *Last Essays on Church and Religion;* in 1879, *Mixed Essays;* and in 1882, *Irish Essays, and Others*. He has delivered interesting public addresses.

A'RNOLD, Thomas, D.D., head-master of Rugby School, was born June 13, 1795, at West Cowes, in the Isle of Wight. In 1807 he was sent to the public school at Winchester, where he remained till 1811, when he was elected a scholar of Corpus Christi College, Oxford. In 1815 he was elected fellow of Oriel College, and he gained the chancellor's prize for the two university essays, Latin and English, for the years 1815 and 1817. As a boy, we are told he was shy and retired; as a youth, disputatious, and somewhat bold and unsettled in opinions; but before he left Oriel, he had won the good opinion of a college which at that time boasted of such names as Copleston, Davison, Whately, Keble, Hawkins, and Hampden. He took deacon's orders in 1818, and the year after settled at Laleham, near Staines, where he occupied himself in preparing pupils for the university. In 1820 he married Mary, youngest daugher of the Rev. John Penrose, rector of Fledborough, in Nottinghamshire, and sister of one of his earliest school and college friends, Trevenen Penrose. About ten years were spent in this quiet and comparatively obscure life; he was preparing himself for the arduous post he afterwards occupied; he was maturing his opinions, and he had also already commenced his great literary undertaking, the *History of Rome*.

It was a period which he himself was accustomed to look back upon with some feeling of regret. His letters at this epoch reveal to us a fine ambitious spirit bending cheerfully to the task of tuition, more useful than glorious; they also prove to us that those views of a religious and political character which afterwards distinguished him, were being matured in the privacy of Laleham. 'I have long had in my mind,' he thus writes to a Mr. Blackstone, 'a work on Christian politics, or the application of the Gospel to the state of man as a citizen, in which the whole question of a religious establishment, and the education proper for Christian members of a Christian commonwealth, would naturally find a place. It would embrace also an historical sketch of the pretended conversion of the kingdoms of the world to the kingdom of Christ in the 4th and 5th centuries, which I look upon as one of the greatest *tours d'adresse* that Satan ever played. . . . . I mean that by inducing kings and nations to conform nominally to Christianity, and thus to get into their hands the direction of Christian society, he has in a great measure succeeded in keeping out the peculiar principles of that society from any extended sphere of operation, and insuring the ascendency of his own.' He here expresses, in a somewhat sportive and familiar manner, the great principle which he afterwards contended for with so much earnestness, that there should be a Christian laity, a Christian legislature, a Christian government; by which he did not mean a system of laws or government formed in the manner of the Puritans, out of texts of Scripture, rashly applied, but imbued with the *spirit* of the New Testament and of the teaching of Christ.

It was at Laleham also that A. first became acquainted with Niebuhr's *History of Rome*. This was an era in his life. It produced a revolution in his historical views, and his own *History of Rome* became modelled almost too faithfully on that of the great German.

From Laleham he was called to undertake the arduous duties of the head-mastership of Rugby School. On these he entered August 1828. Our space does not permit us to dwell upon the details of that system of public education which he perhaps carried to its perfection. We can only take notice of the high tone, moral and religious, which he preserved amongst the boys. He had the tact to make himself loved and feared. He guided with great dexterity the *public opinion of the school*. 'In the higher forms,' says his biographer, 'any attempt at further proof of an assertion was immediately checked. "If you say so, that is quite enough; of course I believe your word;" and there grew up in consequence a general feeling that it was a shame to tell A. a lie—he always believes one.' On one occasion, when he had been compelled to send away several boys, he said: 'It is *not* necessary that this should be a school of 300, or 100, or of 50 boys, but it *is* necessary that it should be a school of Christian gentlemen.'

But the school was very far from occupying the whole energies of A. The *History of Rome* went on; he took part in all the great questions of the day, political and theological. In politics he was a Whig, without being fettered—as we need hardly say—by the ties of party. In the theological discussions of the day, he was chiefly distinguished by the broad views he had adopted of the nature of a Christian church. As already intimated, it was his leading idea that a *Christian people* and a *Christian church* ought to be synonymous expressions. He would never tolerate that use of the word church which limited it to the clergy, or which implied in the clergy any peculiar sacredness, or any traces of mediatorial function. The *priest* was unknown to him in the Christian community; this placed him at once in antagonism to the High Church party; and even clergymen of the Low Church complained that he did not set sufficient value on their sacred order. But all men, of whatever party, admitted and admired the zeal with which he taught that the full spirit of Christianity should permeate the whole of our civil or political life. If he seemed to lower the altitude of the clergy, it was only because he would raise the general level of the laity. He was convinced that 'the founders of our present constitution in church and state did truly consider them to be identical, the Christian nation of England to be the church of England; the head of that nation to be, for that very reason, the head of the church.' It may be doubted whether this is quite historically correct; but it certainly presents a noble theory to the imagination.

In domestic life, Dr. A. was most happy; here he was distinguished by unfailing cheerfulness and amiability. In 1832, he purchased Fox How, a small estate between Rydal and Ambleside, and it was in this charming retreat that he enjoyed in the vacations, amongst the family circle, his own uninterrupted studies. Fox How has become a classical spot to every tourist.

For a brief time he held a place in the senate of the London University; he resigned the seat on finding that he could not introduce some measures which he had at heart. In the year 1842, he received from Lord Melbourne the offer of the Regius Professorship of Modern History at Oxford. This appointment he accepted with peculiar gratification. He delivered some introductory lectures, which were heard with enthusiastic interest; and it was his intention, on his retirement frem Rugby, to enter with zeal upon the duties of his professorship. But this and all other literary enterprises were cut short by a sudden and most painful death. The last vacation was at hand, the journey to Fox How was to be taken in a few days, when he was seized with a fatal attack of spasm of the heart. Few biographies end more abruptly or more mournfully; but the sufferer met his death with perfect fortitude and the full hope of a Christian. He died June 12, 1842. His principal works are *five volumes of sermons;* the *History of Rome* (3 vols.), broken off by his death at the end of the second Punic war, and an *edition of Thucydides*. See *Life and Correspondence of A.*, by Rev. A. P. Stanley, afterwards Dean of Westminster (1845; 12th edition, with additions, in 1881).

A'RNOTT, Neil, M. D., was born in 1788 at Arbroath. He was educated at the Grammar School of Aberdeen, and subsequently at Marischal College in the same city, where he had the advantage of studying natural philosophy under Professor Copland, one of the most successful expounders of mechanical science then living. A. made choice of medicine as a profession; and after going through the medical course at Aberdeen, he went to London 1806, where he became the pupil of Sir Everard Home, surgeon of St. George's Hospital. After spending some years in the naval service of the East India Company, he settled in 1811 as a medical practitioner in London. In addition to his extensive general practice, A. was appointed, in 1815, physician to the French embassy, and afterwards to the Spanish embassy. In 1836, Dr. A. was appointed a member of the senate of the University of London, then established by government. He was afterwards elected a fellow of the Royal Society, and then of the Geological Society. In 1837, he was named a Physician Extraordinary to the Queen.

In 1823—1824, Dr. A. was induced to deliver a course of lectures on natural philosophy in its applications to medicine. The substance of these lectures formed the basis of his *Elements of Physics, or Natural Philosophy, General and Medical*, published in 1827. Of numerous new applications of physical science to medical practice, and to the alleviation of human suffering in general, invented by Dr. A., may be mentioned the Water-bed (q. v.). But it is in connection with improvements in the warming

and ventilation of houses that the name of Dr. A. is most extensively known. In 1838, he published a treatise on *Warming and Ventilating;* and in 1855, another *On the Smokeless Fire-place, Chimney-valves,* &c. The 'Arnott Stove' and the 'Arnott Ventilator,' which, with characteristic philanthropy and disinterestedness, Dr. A. refrained from patenting, are noticed under WARMING AND VENTILATION. In 1861, he published *A Survey of Human Progress,* full of interesting and enlightened views on improvement generally. In 1864, appeared Part I. of the long-promised revision of the *Physics;* this was followed by Part II., which contains the subjects of Optics and Astronomy for the first time, and also an interesting supplement entitled *Arithmetic Simplified.* A.'s last publication was a small work on national education. He died in London, March 2, 1874. In the year 1859 he expressed a wish to a friend to make a contribution to Marischal College, Aberdeen, in aid of a course of lectures on natural philosophy, to be available to young men not regular students of the university. The union of the two Aberdeen Colleges interfered with the project; and a few years later he gave £1000 to the united university, to provide a scholarship in natural philosophy. This was followed by the same gift to each of the other three Scottish universities, and for Aberdeen, a further gift of £500 to the Mechanic's Institution. In London, Mrs. Arnott had already given £1000 to each of two colleges for young ladies, to constitute scholarships for natural philosophy. In 1872, Dr. A. intimated through Dr. Lyon Playfair that he meant to repeat his gift to the Scottish universities; but, in consequence of a fall, his faculties had been permanently impaired, and he was no longer capable of continued thought or decision. An attack of cold in 1858 had permanently affected his hearing; but otherwise, his last years were characterized by his usual flow of spirits. A.'s genius showed itself in a very unusual combination of inventive power with the art of popular exposition. His bent of mind was strongly towards human improvement in every department of thought and conduct.

ARNO'TTO, ARNA'TTO, ANNO'TTA, ANNA'TTO, or ROUCOU, also known on the continent of Europe by the name of ORLEAN, is a red coloring matter, which is obtained in South America and the West Indies from the reddish pulp surrounding the seeds of the Arnotto-tree (*Bixa orellana*) by washing, maceration, fermentation, and subsequent evaporation. It appears in commerce in cakes or balls of 2—4 lbs. weight, wrapped up in leaves, externally brown, internally of a pale blood-red or yellowish-red color, and which have a peculiar animal smell and an astringent taste. Pure A. seldom appears in the market. It is obtained by the mere rubbing off and drying of the red pulpy pellicle which covers the seed; but that which is thus obtained is very pure, and occurs in small round or angular lozenges. The Indians rub this coloring matter into the skin of their whole body, thus intending both to adorn themselves, and to obtain protection against the bites of mosquitoes. Amongst us, A. is used in medicine for coloring plasters, ointments, &c.; and to a considerable extent by farmers for giving a rich color to cheese. It is also used in dyeing, although it does not produce a durable color. It is employed to impart an orange tint to simple yellows. It is an ingredient in some varnishes. It dissolves in alkalies, producing a brown solution, from which it is precipitated yellow by acids. It imparts little color to water, but dissolves in alcohol; alum and sugar of lead throw down a brick-red precipitate from the alcoholic solution. In South America, A. is very extensively mixed with chocolate, not only for the sake of the color, but also for the improvement of the flavor.—The genus *Bixa* belongs to the natural order FLACOURTIACEÆ (q. v.), and is distinguished by complete flowers with simple stigma, a hispid calyx of five sepals, and a two-valved capsule. The A. shrub is a native of tropical America, but has been introduced into other warm countries. It grows to the height of 7—8 feet, and has heart-shaped pointed leaves, and large flowers of a peach-blossom color, which grow in loose clusters at the extremities of the branches. The capsules are oblong, and contain 30—40 seeds enveloped in red pulp (the A.). The seeds are said to be cordial, astringent, and febrifugal. The roots are used in broth. They have the properties of A. in an inferior degree.

A'RNSBERG, one of the three departments of the Prussian province of Westphalia (q. v.), having an area of 2900 square miles, and a population (1880) of 1,068,141. With the exception of the valley of the Lippe, the whole department belongs to the highlands of the Lower Rhine. Only in a few of the valleys is there good arable soil; on the other hand there is a great deal of good timber, more than a third of the whole area consisting of forests. But the principal resources of the district are its subterranean riches, in coal, iron, lead, silver, &c. Its abundant water-power has also led to the establishment of numerous factories, mills, &c. ARNSBERG, the chief town of the department, is situated on the Rhur, 44 miles south-east from Münster; pop. (1880) 6131. It has several manufactures, such as linen, broadcloth, potash, &c. In the orchard below the castle is still pointed out the spot where the famous Femgerichte (q. v.) of A. was held.

A'RNSTADT, the chief town in the principality of Schwarzburg-Sonderhausen, is situated in a picturesque country on the banks of the Gera, twelve miles south of Erfurt, and has a pop. (1880) of 10,516. It is one of the oldest Thuringian cities, its existence being traceable as far back as 704 A.D. Formerly it was the chief emporium for the trade in fruit and timber between the fertile lowlands and the Thuringian forest region, but is now a manufacturing town, employing a very considerable number of hands in weaving, glove-making, brewing, pottery, &c. A rich vein of rock-salt has been recently discovered in the neighborhood of the town, and a new copper-mine opened.

AROKSZALLA'S, a town of Jazygia, Hungary, 44 miles north-east from Pesth, and an entrepôt for the trade between that city and Upper Hungary. It stands in a plain on the Gyöngöys Patak, a small stream, by which it is almost encircled. The surrounding country is fertile, and affords excellent pasture. Pop. (1880) 12,794.

ARO'MA, a term sometimes employed to designate those substances the extremely minute particles of which are supposed to affect the organ of smell so as to produce particular odors, and frequently as synonymous with *odor*. The particles diffused through the atmosphere, and affecting the olfactory nerves—if the theory of particles of matter so diffused be correct—must indeed be extremely minute, as odoriferous substances such as musk, the smell of which is felt at a considerable distance, continue to diffuse their odor, and according to this theory, these particles, for years, without sensible diminution of weight. See NOSE, &c. The term A. is usually employed only with reference to particular kinds of odor, not easily defined or distinguished in words. Thus, we speak of the *A.* of roast-meat, and of the *A.* or *aromatic* smell of hyssop, mint, and other plants. Aromatic smells are very characteristic of some natural orders of plants, as *Labiatæ* (Mint, &c.) and *Compositæ* (Milfoil, &c.). They have been very generally supposed to depend upon essential oils, but resins are often equally aromatic.

AROMA'TIC VINEGAR differs from ordinary vinegar (which is acetic acid diluted with water) in containing certain essential oils which impart an agreeable fragrance. It is generally prepared by adding the oils of cloves, lavender, rosemary, and *Acorus Calamus* (and sometimes camphor) to crystallizable acetic acid, or by distilling the acetate of copper in an earthen retort and receiver, and treating the liquid which passes over with the fragrant oils mentioned above. A. V. is a very pleasant and powerful perfume; it is very volatile, and when snuffed up by the nostrils, is a powerful excitant, and hence is serviceable in fainting, languor, headache, and nervous debility. A. V. is generally placed on a sponge in a smelling-bottle or in a *vinaigrette;* it can also be purchased as a liquid in phials; and a drop or two allowed to evaporate into a sick-room, overpowers, but does not destroy any unpleasant odor. The liquid must, however, be cautiously dealt with, as it is a very corrosive substance.

AROMA'TICS constitute a class of medicines, which owe their properties to the essential oils, to benzoic and cinnamic acids, to volatile products of distillation, or to odorous glandular secretions. The plants that contribute to this class of medicines are those which yield essences, camphor, or odorous resins, and amongst the families which yield the most important aromatics are the Labiatæ, Umbelliferæ, Lauraceæ, Myrtaceæ, Aurantiaceæ, Coniferæ, Scitamineæ, Orchideæ, &c. In some cases, the aromatic matter is diffused throughout all parts of the plant, but it is usually condensed in particular organs, such as the root, in the case of ginger and galanga; or the bark, in the case of cinnamon, canella, and cascarella; or the flowers, as in the case of cloves; or the fruit, as in the case of anise and vanilla; or the wood, as in the case of sandal-wood and aloes-wood; or the leaves, as in the case of most of the Labiatæ, Umbelliferæ, &c.

Aromatics may be arranged in the following sub-classes: (1.) Those in which the active principle is an essential oil, as the oil of thyme, lavender, cajeput. neroli, fennel, &c. (2.) Those containing camphor, or an allied body, such as artificial camphor obtained from turpentine. (3.) Bitter aromatics, in which there is a mixture of a bitter principle and an essential oil, as chamomile, tansy, wormwood, &c. These are tonics and vermifuges. (4.) Those of which musk is the type, such as civet and amber; and certain plants with a musk-like odor, such as *Malva moscata, Mimulus moschatus,* and *Hibiscus abelmoschus.* (5.) Those containing a fragrant resin, as benzoin, myrrh, olibanum, storax, and the balsams of Peru and Tolu, which possess stimulant properties. (6.) Lastly, those which are artificially produced by destructive distillation, as tar, creosote, benzol, or the various empyreumatic oils.

As a general rule, these substances act as diffusible stimulants of more or less power, and as anti-spasmodics, while those in which a bitter principle is present act as vermifuges and tonics.

The whole class were formerly regarded as possessing disinfectant and antiseptic properties, and there is no doubt that some, as coal-tar, creosote, &c., strongly possess this property. In this country we usually associate aromatics with other medicines; but in France aromatic infusion, lotions, baths, &c., are much prescribed. It will suffice to give the composition of aromatic infusion as an illustration. Take equal parts of the leaves of sage, ordinary and lemon thyme, hyssop, origanum, wormwood, and mint. Infuse 50 parts of these leaves in 100 parts of boiling water.

ARONIA. See CRATÆGUS.

AROO'STOOK, a river which, rising in the north of Maine, falls into the St. John in New Brunswick, after a course of about 120 miles. It possesses a historical interest from its connection with the long-agitated question of the north-east boundary between British America and the United States.

ARPAD, the national hero of Hungary, was the son of Amos, the leader under whom the Magyars first gained a footing in Hungary. He was chosen duke on his father's death in 889, and by a course of incessant and mostly successful warfare with the Bulgarians, Wallachians, Moravians, &c., extended the first conquests of the Magyars on all sides. He also made more than one successful incursion into Italy about 900, and returned laden with booty. He died in 907, leaving his son in possession of the supreme command. The A. dynasty became extinct in the male line with Andreas III. in 1301. A. yet lives in the popular songs of the country, and his history, even in the oldest chronicles, is mixed up with a deal of legendary matter.

ARPE'GGIO, in Music, a chord of which the notes are given, not contemporaneously, but in succession. From any one chord, several forms of A. may be produced. Bass-chords thus treated form an *Alberti Bass*, so named from Domenico Alberti (1730—1740), a popular singer and player, who often played the bass in this style.

ARPENT is the old French land-measure, corresponding to our acre. The name is from the ancient Gallic *aripennis*, which was identified by Columella with the Roman *actus*, or half *jugerum*. Ordinarily an A. may be reckoned as five-sixths of an acre; but the precise comparative value of the three most in use will be seen in the following table:

	French Hectares.
Acre, English imperial or statute	0·40466
Arpent, of Paris	0·32400
" d'ordonnance	0·48400
" common	0·40000

ARPI'NO, the *Arpinum* of the ancients, a town of Southern Italy, the birthplace of Cicero and Caius Marius, is situated in the province of Caserta, 65 miles north by east of Naples. It stands on the lower ridge of a lofty hill, some 6 miles to the left of the river Garigliano, the ancient Liris. The old town, in early Roman times, was built on the top of a steep rock, forming part of the territory of the Volscians. Many remains of the ancient structures are still to be seen, especially acyclopean wall, which runs along the northern brow of the hill occupied by the present town, and extending to the ancient citadel. About the year 188 B.C., the citizens received the freedom of the city of Rome, with all its privileges, and Arpinum, during the later years of the republic, was a flourishing municipal town.

The population of A. in 1872 was 5836. Manufactures of woollen cloth, parchment, paper, and leather are carried on. The town has a charming appearance from the highly picturesque character of the surrounding woods and mountains. Iron, white marble, variegated red marble, and marble of a yellowish color, are got in mines and quarries in the neighborhood.

A'RQUA, a village in the province of Padua, Venice, 12 miles south-west of Padua, in the heart of the Euganean Hills. Pop. 1200. Petrarch's furniture is still preserved in the house in which he died here (July 18, 1374), and his monument of red marble is to be seen in the churchyard.

A'RQUEBUS, or HA'RQUEBUS, was the first form of hand-gun which could fairly be compared with the modern musket. Those of earlier date were fired by applying a match by hand to the touch-hole; but about the time of the battle of Morat, in 1476, guns were used having a contrivance suggested by the trigger of the arbalest or cross-bow, by which the burning match could be applied with more quickness and certainty. Such a gun was the A. Many of the yeomen of the guard were armed with this weapon, on the first formation of that corps in 1485. The A. being fired from the chest, with the butt in a right line with the barrel, it was difficult to bring the eye down low enough to take good aim; but the Germans soon introduced an improvement by giving a hooked form to the butt, which elevated the barrel; and the A. then obtained the name of the *haquebut*. Soldiers armed with these two kinds of weapon were designated *arquebusiers* and *haquebutters*—the former were common in the English army in the time of Richard III., the latter in that of Henry VIII.

Arquebusier.

ARRACA'CHA (*Arracacha esculenta*), a plant of the natural order *Umbelliferæ*, a native of the elevated table-lands in the neighborhood of Santa Fe de Bogota and Caraccas, and of regions of similar climate in other parts of tropical America. It is much cultivated in its native country for its roots, which are used as an esculent. The root divides into a number of parts, which resemble cows' horns or large carrots. When boiled, they are firm and tender, with a flavor not so strong as that of a parsnip. The plant is very like hemlock, and has a similar heavy smell. Humboldt, indeed, referred to the genus *Conium* (Hemlock), but it has since been made the type of a new genus. The flowers are in compound umbels, and are of a dull purple color. The A. was at one time very strongly recommended as a substitute for potatoes; it was introduced into Britain through the exertions of the Horticultural Society, and its cultivation perseveringly attempted; but it has been found unsuitable to the climate of Britain and other parts of Europe, where it has been tried, perishing on the approach of the frosts of winter without having perfected its roots. The dry weather of summer is also unfavorable to it. The climate of the south of Ireland resembles that of its native regions more than any other in the British Islands. It seems to require a very regular temperature and constant moisture. There are probably some parts of the British colonies in which the A. would be found a very valuable plant. In deep loose soils, it yields a great produce. It is generally propagated, like skirret, by offshoots from the crown of the root. By rasping the root and washing, a starch similar to arrow-root, is obtained.—There is another species of the same genus, *A. moschata*, a native of the same regions, the root of which is uneatable.

Arracacha.

ARRA'CK, RACK, or RAKI, is the East Indian name for all sorts of distilled spirituous liquors, but chiefly to that procured from toddy or the fermented juice of the cocoa and other palms, and from rice. The palms in other tropical countries furnish a fermented beverage similar to the toddy of India, and in a few instances also it is distilled, but arrack essentially belongs to India and the adjacent countries. The cocoa-nut palm (*Cocos nucifera*) is a chief source of toddy or palm wine, and is obtained from trees ranging from twelve to sixteen years old, or in fact at the period when they begin to show the first indication of flowering. After the flowering shoot or spadix enveloped in its spathe is pretty well advanced, and the latter is about to open, the toddy-man climbs the tree and cuts off the tip of the flower-shoot; he next ties a ligature round the stalk at the base of the spadix, and with a small cudgel he beats the flower-shoot and bruises it.

This he does daily for a fortnight, and if the tree is in good condition, a considerable quantity of a saccharine juice flows from the cut apex of the flower-shoot, and is caught in a pot fixed conveniently for the purpose, and emptied every day. It flows freely for fifteen or sixteen days, and less freely day by day for another month or more; a slice has to be removed from the top of the shoot very frequently. The juice rapidly ferments, and in four days is usually sour: previous to that it is a favorite drink known in India by the natives as callu, and to the Europeans as toddy. When turning sour, it is distilled and converted into A., known better to the Hindus by the name of Naril, and by the Cingalese as Pol or Nawasi. A similar spirit is made pretty largely from the magnificent fan-leaf palm, *Borassus flabelliformis*, and also from the so-called date-sugar palm, *Areuga saccharifera*. Large quantities of arrack are made from fermented rice prepared as malt—both in India, Ceylon, and Batavia; in the last mentioned place, sugar and molasses are also added to the rice.

It is probable that the use of arrack is more widely diffused among the human race than the produce of the vine (wine and brandy) and of barley (whisky, beer). The date-palm of the Sahara, the oil-palm of West Africa, and the cocoa-nut palm of the Pacific Islands are made to yield it.

The unscientific method of preparing these alcoholic spirits renders them generally very distasteful to European taste, the process of rectification being rarely if ever employed. Some carefully prepared samples of great age, however, find favor, and are used in making punch and other drinks, not only in India and Java, but small quantities also find their way to Britain, for the gratifi-

cation of palates trained in India. The cocoa-nut tree is especially valuable for this industry, because it bears twelve times in the year after it once begins, and continues to do so for as much as forty years. It is the rule, therefore, to prevent undue exhaustion of so valuable a tree, to discontinue the collection of juice at intervals, and allow the natural process of fruit-bearing to go on: in this way, it is usual to divide the year between the two crops. Of late years a considerable amount of rum has been produced in the East Indies from the sugar-cane, and the molasses yielded by it. This is often called arrack by the natives, and leads to errors as to the statistics of the latter material. The word Saki, used by the Japanese for rice spirit, seems only an alteration of *Raki* or arrack. An imitation A. is prepared by dissolving benzoic acid in rum, in the proportion of 20 grains of the former to 2 pounds of the latter.

A'RRAGONITE, a mineral essentially consisting of carbonate of lime, and so agreeing in chemical composition with calcareous spar (q. v.), but differing from it in the form of its crystals, of which the primary form is a rhombic prism with angles of 116° 16′ and 63° 44′, the secondary forms being generally prismatic and pyramidal. The effects of heat on them shows another difference, A. being reduced to powder by a heat in which calcareous spar remains unchanged. Such differences between minerals of the same chemical composition appeared very improbable, and when Stromeyer, in 1813, detected the presence of a little carbonate of strontia in A., they were immediately ascribed to this as their cause; but it has since been shown not only that the quantity of strontia is very small, variable, and therefore to be regarded as accidental, but also that the differences between the two minerals may be accounted for by difference of temperature when crystallization was taking place. A. appears to be the product of crystallization taking place at a higher temperature than that in which calcareous spar is produced; and accordingly it is frequent in volcanic districts and in the neighborhood of hot springs, as at Carlsbad. It is frequently found in trap-rocks, as in Scotland. It derives its name from the province of Aragon in Spain. It sometimes occurs stalactitic. Its crystals are sometimes prisms shortened into tables, sometimes they are lengthened into needles. Twin crystal (*macles*) are very common. *Satin Spar* is a variety of it, in which the crystals are of a fine fibrous silky appearance, and combined together into a compact mass. *Flos ferri* (i. e., flower of iron) is a name given to a coralloidal variety which sometimes occurs in iron mines.

A'RRAH, a town in the district of Shahabad and the presidency of Bengal, in lat. 25° 31′ N., and long. 84° 43′ E. It is situated in a fertile country, and contains, according to the census of 1871, a pop. of 39,386. It is on the route between Dinapore and Ghazeepore, 25 miles W. of the former, and 75 E. of the latter. During the mutiny of 1857, A. became in variety and intensity of interest second only to Cawnpore, Delhi, and Lucknow, connected as it was with a heroic defence, a heavy disaster, and a brilliant victory. The defence was that of an isolated house, for eight days, against 3000 sepoys with 2 field-pieces, the garrison consisting of less than 20 whites, all civilians, and 50 Sikhs, whose fidelity perhaps was doubtful till proved by trial. The disaster was the nocturnal surprise in the jungle of a detachment almost entirely European, sent to the relief of the beleaguered dwelling—the loss having been 290 out of 415. The victory was won by a force of 172 men, 12 of them mounted volunteers, and 3 guns, over a host numbering nearly 20 to 1. In fact, A., happily with the exception of the cold-blooded massacre of women and children, presented, in miniature, nearly all the phases of the most formidable and eventful insurrection on record. For a detailed account of these events, see *Chambers's History of the Indian Revolt*.

ARRAIGN'MENT, in the practice of the criminal law in England, means calling a prisoner by his name to the bar of the court to answer the matter charged upon him in the indictment. And having the presumption of innocence in his favor, it is the law, and so laid down in the most ancient books, that, though charged upon an indictment of the highest nature, he is entitled to stand at the bar in the form and in the garb of a free man, without irons or any manner of shackles or bonds, unless there be evident danger of his escape, or of violence at his hands. When arraigned on the charge of treason or felony, the prisoner is called upon by name to hold up his hand, by which he is held to confess his identity with the person charged. This form, however, is not an essential part of the proceedings at the trial, and it is sufficient for the prisoner, when arraigned, to confess his identity by verbal admission or otherwise. When thus duly arraigned, the indictment is distinctly read over to the accused in the English tongue, and he then either confesses the fact—that is, admits his guilt—or he puts himself upon his trial by a plea of *Not guilty*. Formerly, one of the incidents of the A. was the prisoner *standing mute*, as it was called—that is, refraining from, or refusing, a direct answer to the indictment; in which case the court proceeded to inquire whether the silence was of malice on the part of the prisoner, or was produced by the visitation of God, and to deal with him accordingly. But by the 7 and 8 Geo. IV. c. 28, s. 2, it is enacted that where a prisoner shall stand mute of malice, it shall be lawful for the court to order the proper officer to enter a plea of 'Not guilty,' on which the trial shall proceed, as if the plea had been actually pleaded by the prisoner himself. Where there is reason to doubt, however, that the prisoner standing mute is sane or not, a jury consisting of any twelve persons who may happen to be present is forthwith charged to inquire whether he has intellect enough to plead and to understand the course of the proceedings. If they find the affirmative, the plea of 'Not guilty' is entered, and the trial goes on; but if the negative, the insane person will be ordered by the court to be kept in strict custody during Her Majesty's pleasure, according to the 39 and 40 Geo. III. c. 94, s. 2.

By 19 and 20 Vict. c. 16, facilities are provided for the trial of prisoners in the Central Criminal Court, although the offence may have been committed out of the jurisdiction of that tribunal, and it directs the A. to take place in the ordinary form.

In the Scotch criminal law, the expression *Calling the Diet* corresponds to A. The prisoner is called upon by name by the presiding judge to attend to the indictment against him, which is read aloud by the clerk, and the prisoner is then required to plead, which he does, as in England, by a plea of 'Guilty' or of 'Not guilty;' in the event of which latter, the trial proceeds—the prisoner, either by himself or by his counsel, having always the last word before the court and before the jury. In this respect, it is only so in England in some cases.

According to Sir Matthew Hale, the term A. is derived from *arraisoner, ad rationem ponere*, to call to account or answer, which in ancient French law would be *ad-resoner*, or, abbreviated, *a-resner*. See TRIAL, INDICTMENT, INFORMATION, PROSECUTION, PLEA, VERDICT, NOT PROVEN.

A'RRAN, an island in the mouth of the Firth of Clyde, Scotland, about 5 miles south-west of Bute, 13 west of Ayrshire, and 4 east of Cantire, from which it is separated by Kilbrennan Sound. It is of an oval form, about 20 miles long and 12 broad; area, 165 sq. miles, about 15,000 acres, or a seventh part, being cultivated. Pop. (1881) 4730. The general aspect of A. is mountainous and heathy, and in the north, the jagged peaks are singularly grand. Around the coast is a low belt of ground, with lofty cliffs on the south and south-west, from which the country rises abruptly. The highest point is Goatfell (in Gaelic named *Gaoth Bheinn* or *Beinn Ghaoith*, 'Wind Mountain'), an obtuse pyramid, 2865 feet high, and a prominent feature of the island. From its sides slope the romantic glens of Rosa and Sannox, and at its base to the south-east opens Brodick Bay, at the head of which lay, until lately, Brodick village. The houses which composed it have now been removed, and a new village has sprung up on the opposite side of the bay, called Invercloy, where there is a spacious hotel. To the south of this, round a bluff headland, is Lamlash Bay, the chief harbor of A., and the best on the Firth of Clyde, sheltered by Holy Island, once the seat of a monastery. A picturesque mass of columnar basalt, 900 or 1000 feet high, succeeds. Further south lies Whiting Bay, near which are two cascades 100 and 50 feet high respectively. At the south-east point of A. is Kildonan Castle, opposite which is the small isle of Piadda, crowned by a light-house. Large caverns occur in the cliffs of the south and south-west coasts. In one of these, the 'King's Cave,' in the basaltic promontory of Druimodune, Robert the Bruce hid himself for some time. Shiskan Vale, opening into Druimodune Bay, is the most fertile part of A. Loch Ranza, a bay in the north end of A., runs a mile inland, and is a herring-fishing rendezvous. There is daily communication with A. by means of steam-boats from the Clyde, the ports touched at being Brodick, Lamlash, and Corrie.

The geology of A. is almost unique, and displays a greater succession of strata than any other part of the British Isles of equal extent. The south-east half of A. consists of Devonian sandstone, extending from the east coast 4 or 5 miles inland, and running south-west from Brodick beyond the center of the island; and of trap rocks and carboniferous strata, which occupy the middle and western portions. The north-west half consists of a central granite nucleus, including Goatfell, bordered on the west by a tract of mica-slate, and on the north, east, and south by lower Silurian rocks, which, again, have a run of Devonian sandstone on the east and south. Lias and oolite lie on the mica-slate. There are only rivulets in A., and one of them tumbles over a precipice 300 feet high. Some level parts in the south half of A. are fertile. The chief crops are oats and potatoes. Cattle, sheep, fish, and oats are exported. The greater part of A. belongs to the Duke of Hamilton, whose seat is Brodick Castle. A. forms part of the county of Bute, and contains two parishes. Many antiquities occur, such as cairns, unhewn obelisks, monumental stones, and Druidical circles. Several stone coffins were found in a cairn 200 feet in circumference. Loch Ranza Castle, now in ruins, was once a residence of the Scots kings. See work by Landsborough and Bryce.

A'RRAN, SOUTH ISLES OF. These are three small islands lying N.E. and S.W. across the entrance to Galway Bay, about 4

miles off the W. coast of Ireland, and 27 west of Galway city. They form the barony of A., and give the title of Earl to the Gore family. Total area, 11,287 acres. The principal or west island, Inishmore, is 7 miles long and 2 broad; Inishmaan, or 'Middle Isle,' comes next; and then Inishere to the S.E. Pop. in 1871, 3050, of which number 2122 inhabited Inishmore, 433 Inishmaan, and 495 Inishere. Of the total pop. all but 57 were Roman Catholics; 504 could read and write, 143 could read only, and the rest were illiterate. The islands consist of the carboniferous limestone of the bed of Galway Bay, and rise to the height of 100 to 200 feet on the west side, ending in cliffs facing the Atlantic. Most of the land is rudely cultivated. The chief crops are rye, oats, and potatoes. Most of the inhabitants engage in fishing; and the *corragh* or wicker-work skiff is still to be seen here. They are subject to famines from parching rainless west winds in August destroying the potato-crop. These islands contained at one time 20 churches and monasteries. Inishmore was the center of these, still known as Aran-na-naomh, or 'Arran of the Saints.' Many pilgrims still visit the old shrines and relics scattered through the islands. St. Kenanach Church, built in the 7th c., still exists, all but its stone roof, as well as the stone oratories and little bee-hive stone huts of the monks of the 6th and and 7th centuries. There are nine circular cyclopean fortresses of unhewn uncemented stones (portions of the walls still being 20 feet high), supposed to have been built in the 1st c. by the Fir-Bolg or Belgæ. The largest of these, Dun-Aengus, on a cliff in Inishmore, 220 feet high, is one of the most magnificent barbaric monuments in Europe.

ARRA'NGING, a term in Music which means the adapting of a piece of music so as to be performed on an instrument or instruments different from those for which it was originally composed, as when orchestral or vocal compositions are set for the piano-forte, or the reverse. An arrangement is often a mere lifeless transposition of the original, the only guiding principle being the mechanical possibility of performance. Of this kind are most of the piano-forte arrangements of the orchestral works of Mozart, Beethoven, &c.—partly from the arranger working merely for hire, and partly from a mistaken reverence for, and fear of altering, the original. It is different when an arranger, who thoroughly comprehends the spirit of the original, takes advantage of the peculiar means of expression afforded by the new form of presentation, to reproduce as much as possible the original effects. In this last respect, the arrangements of Franz Liszt have excelled all others, although in some cases he may have overstepped the boundary of propriety. See POT-POURRI and FANTASIA.

ARRAS (the ancient *Nemetacum*), a fortified town and capital of the department of Pas-de-Calais, as it was formerly of the province of Artois, in France. It is situated on the banks of the Scarpe, partly on an eminence, and partly on a plain, and consists of four divisions—the city, upper town, lower town, and citadel. It is a principal station on the French Northern Railway, distant from Paris by this route 134 miles, and from Brussels 97. Pop. (1872) 21,447; (1876) 26,764. The houses are of hewn stone, and in the lower town they are handsomely built and uniform; the streets straight and wide, set off with several fine squares, and many beautiful public buildings. Among the principal edifices are the Cathedral of Notre Dame, the residence of the prefect, the town-hall, the theater, and the public library.

A. ranks as a fortified town of the third class, its fortifications being the first that were constructed by the celebrated Vauban, according to his own system. It has been the seat of a bishop since 390 A.D., and two ecclesiastical councils have been held here—one in 1025, the other in 1490.

The corn-market of A. is the most important in the north of France. Its principal manufactures are iron-ware, woollen and cotton goods, hosiery, lace, pottery, and leather. Its trade, which is considerable, is in corn and flour, oil, wine and brandy, with the industrial products of the city.

It appears from the writings of Jerome that A. was remarkable for its woollen manufactures in his time; and afterwards, during the middle ages, it was famed for its tapestry; indeed, the name of the town was transferred to this article of manufacture, and *arras* was the name given in England to the richly figured hangings that adorned the halls of the kings and the barons.

In 1482, A. with Artois was ceded by the states of the Netherlands to Louis XI. of France; but the inhabitants having revolted, the king laid siege to the town, stormed it, and slew or expelled the people, whom he replaced by others brought from all parts of his dominions, ordering the city to be thenceforward called *Franchise*, to obliterate the very name of A. Soon afterwards (1493) it was ceded to Maximilian of Austria, and was possessed by the Spanish branch of the House of Hapsburg till 1640, when Louise XIII. of France took it after a long siege. By the treaty of the Pyrenees, it was finally ceded to France. A. suffered much in the time of the first French revolution, especially in the year 1793. Robespierre, the Terrorist, was a native of the town.

ARRA'YER, a title given to certain military officers in England in the early part of the 15th c. There were two of them in each county, sometimes called Commissaries of Musters. Their duties were set forth in an ordinance of Henry V., from the terms of which it appears that the arrayers were army inspectors, or, rather, militia inspectors, and in some sense precursors to the modern lords-lieutenant of counties.

ARRE'ST is a legal term used both in criminal and civil process. Criminal A. has already been sufficiently considered under the word APPREHEND (q. v.); and in civil procedure it may be simply defined to be the execution of a judicial or prerogative order, by which the liberty of the person may be restrained, and obedience to the law compelled. In the practice of the Court of Chancery, a defendant may be arrested for his contempt in not putting in his answer to a bill filed against him; and persons in all the superior courts may be arrested or attached for contempt. But in its ordinary legal acceptation A. is used to signify the enforcement of the judgment or order of a court of law, in order to satisfy justice. In the execution of such judgment, the party against whom it has been given may be arrested by means of a writ of *capias ad satisfaciendum*, or a *ca. sa.*, the purpose of which is to imprison the body of the debtor till he pays the debt or damages and costs. It is directed to the sheriff, commanding him to take the body of the debtor, and have him at Westminster immediately after execution thereof, to make the plaintiff satisfaction for his demand. This writ might, at one time, issue for a judgment debt of any amount; but by very recent statutes it was provided that it shall not issue in the case of a debt not exceeding £50, exclusive of costs; subject, however, to this proviso, that where such debt should appear to the judge trying the case (being a judge of the superior courts, or a barrister or attorney) to have been incurred under false pretenses, or with a fraudulent intent, or without a reasonable assurance of being able to pay or discharge the same, it shall be lawful for such judge to order the defendant to be taken and detained in execution upon such judgment, as if the act had not passed. This has since been adopted as the general law applicable to debts of any amount, and the abolition of imprisonment for debt was effected by the Debtors Act, 32 and 33 Vict. c. 62. No person, since 1869, can be imprisoned in England for making default in payment of a sum of money except in a few rare cases; such as when a court has ordered a sum of money to be paid, and it is not paid, and the debtor has since acquired the means to pay it, but refuses. In such cases, the judge may order the debtor to be committed to prison for six weeks or less until the money is paid. So that under this statute of 1869 none can be imprisoned for debt except for some special cause resembling fraud; and even then the imprisonment is limited to one year.

A defendant may also be arrested under a writ of *capias ad respondendum*, which issues as follows—where a plaintiff swears by affidavit that he has a cause of action against a defendant to the amount of £50 or upwards, or has sustained damage to that amount, that there is reason for believing that the defendant is about to quit the country, and that his absence will be detrimental to the plaintiff's action. An order is made by a judge, when the writ in question issues, directing the sheriff to arrest the defendant, who remains in custody until he has given security in respect of the plaintiff's demand. But this imprisonment cannot exceed six months. This proceeding is now regulated by the Absconding Debtors Act, 33 and 34 Vict. c. 76. Formerly, a defendant might be arrested on what is called mesne process, that is, process issuing at the commencement and during the progress of a suit; but by recent statutes, such A. is abolished, excepting as above explained.

Under such and similar authority, A. may be made of the person. There are classes, however, who are exempted by privilege from A.—thus, ambassadors and other diplomatic representatives of foreign courts; all members of the peerage, Scotch and Irish as well as English; all members of parliament; all persons connected with a cause before a court of justice, and attending in the course of it, such as witnesses, attorneys, and barristers—although in regard to the latter (barristers), it may be more correctly stated that they are entitled to the privilege only when attending the *superior courts;* and Mr. Archibold, in his Practice of the Common Law, refers to a case where a barrister was discharged who was arrested on circuit. The Queen may also, by her writ of protection, privilege any person in her service from A. during a year and a day, a prerogative, however, which is seldom, and, at the present day, scarcely ever exercised. In regard to parliamentary exemption from liability to civil process, however, the privilege does not preclude the process from issuing, it only protects the *person* of the member himself; for by 10 Geo. III. c. 50, it is enacted that any action or suit may at any time be brought against any person entitled to privilege of parliament; and that no such process shall at any time be impeached or delayed by pretence of any such privilege, except that the person of a member of the House of Commons shall not thereby be subjected to any arrest

or imprisonment. It is likewise provided by the Bankruptcy Act, 1869 (32 and 33 Vict. c. 71, s. 120), that if a person having privilege of parliament commits an act of bankruptcy, he may be dealt with as if he had no privilege. When he is adjudged a bankrupt, he will for one year following be deemed incapable of sitting in parliament unless he satisfy the creditors, and if he do not, then his seat becomes vacant. But now, as all persons, including peers, may be made bankrupt, none is liable to arrest unless he in some way thwart the proceedings in bankruptcy or abscond.

In the Scotch law, the word A. is not a technical term for process against the person. But see ARRESTMENT, and ARRESTMENT FOR FOUNDING JURISDICTION.

ARREST OF JUDGMENT, in the practice of the English common law courts, was an expedient after verdict on the part of an unsuccessful defendant, who endeavored to get the judgment arrested or withheld, on the ground that there was some error which vitiated the proceedings; and if this objection succeeded, it was fatal, no amendment being allowed after trial. But as this rule was found to be productive of great inconvenience, expense, and injustice, it has been considerably modified by the Common Law Procedure Act of 1852 (the 15 and 16 Vict. c. 76), under which, omitted facts or other matter may, by leave of the court, be suggested, by which the error may be corrected. See JUDGMENT.

ARRE'STMENT, in the Scotch law, is the legal process or diligence, as it is called, by means of which a debtor, where the debt is of a personal nature, is prohibited from making payment or delivery to his creditor until another debt or claim due to the person making use of the arrestment by such creditor is secured or paid. Thus, if A owes £100 to B, but B, again, is indebted to C, arrestment may be used by C in the hands of A; the effect of which is to prevent A paying to B until C's claim has been satisfied. A, the party in whose hands the arrestment is laid, is called the arrestee; C, the user of the arrestment, is called the arrester; and B, the arrester's debtor, is called the common debtor. The arrestment, however, has not the effect of transferring the debt or subject arrested. For that purpose, a particular form of action, called *an action of furthcoming*, is necessary, decree in which operates as a complete transfer to the arrester. This process may be sued out either by authority of the Court of Session or by that of an inferior judge. The procedure is now regulated by the 1 and 2 Vict. c. 114, ss. from 16 to 22 inclusive.

The corresponding English term is ATTACHMENT OF DEBTS (q. v.).

ARRESTMENT FOR FOUNDING JURISDICTION. This is a form of proceeding in the practice of the Scotch law, and it is of an extremely important nature, for, by means of it, a foreigner, or one beyond the jurisdiction of the courts of Scotland, who happens to have any property in that country, may be sued in the Scotch tribunals. It is a personal remedy, and the mode of procedure is thus: The summons (or declaration, as it would be called in England), which is executed by leaving a copy in the proper office in Edinburgh, contains in express terms a warrant to arrest *ad fundandam jurisdictionem;* and when served on the party having possession of the foreigner's property, such warrant has the effect of attaching it, so as to give the court jurisdiction over the foreigner himself. This manner of founding jurisdiction is said to have been borrowed by the Scotch from the lawyers of the Netherlands, and it can be traced back in the practice of the Scotch courts for upwards of a century. In a case, however, brought by appeal to the House of Lords from Scotland, an attempt was made to show, that for this mode of A. there was no sufficient authority in the law of that country, and it was represented to the House as a barbarous contrivance of comparatively recent introduction. But their lordships had no hesitation in affirming the judgment of the Court of Session. A like practice exists in London, called foreign attachment, but is peculiar to the city.

ARRESTMENT OF WAGES is supposed to exercise a baneful influence on some of the working-classes in Scotland, by putting them in the power of greedy and oppressive dealers, who, in the knowledge of the power they thus possess, are too ready to give credit to working-people, and thus encourage them in extravagance. It was the object of so much complaint in Glasgow, that a government inquiry was instituted into its operation in 1853. That inquiry developed a sad amount of extravagance and folly, but did not afford a hope that any mere alteration in the machinery of the law would remedy a deep-rooted social evil. Its most alarming features were found in the female manufacturing population, the younger of whom especially, led by avidity for fine clothes, were the victims of a powerful organization of dealers, on what is called the club-ticket system. It is not, however, allowed to arrest wages in summonses for small debts, i. e., under £12 Moreover the wages of all laborers and workpeople were declared by statute 33 and 34 Vict. c. 63, to be exempt from arrestment for debt, except where there was a surplus earned beyond 20*s.* per week. In England, wages cannot be attached for debt except in one or two exceptional cases.

A'RRHENATHE'RUM, a genus of Grasses, allied to *Holcus* (see SOFT-GRASS) and *Avena* (see OAT), and distinguished by a lax panicle, 2-flowered spikelets with two glumes, the lower floret having stamens only, and a long twisted awn above the base; the upper floret perfect, with a short straight bristle below the point.—The name A. is from the Greek *arrhen*, male, and *ather*, an awn. *A. avenaceum* (*Avena elatior* of Linnæus, also known as *Holcus avenaceus*) is a common grass in Britain. It is sometimes called OATLIKE GRASS, from the resemblance to the coarser kinds of oats in the general appearance of the panicle. In France, it is very much cultivated for fodder, and is often called FRENCH RYE-GRASS. It has, however, no affinity to the true Rye-grass (*Lolium*). It is a tall perennial grass, 2—3 feet high, becomes luxuriant early in the season, and continues long productive. It is, however, a rather coarse grass, and has a somewhat bitter saline taste; it is not so acceptable to cattle as many other grasses, and is therefore generally regarded by British agriculturalists as unworthy of cultivation on the best soils; but it is found suitable for some comparatively arid situations, and to form a coarse herbage under trees in plantations.—A variety or distinct species, differing from it in having a knotted or bulbous base to the stem, instead of a simple fibrous root, is called by some botanists *A. bulbosum*. It is also common in Britain, but is a very inferior grass, and owing to the character of its roots, difficult of extirpation from lands in which it appears as a weed.

Arrhenatherum: *a*, panicle, reduced; *b*, root and lower part of culm, reduced; *c*, a single spikelet, natural size.

ARRIA'NUS, FLAVIUS, a native of Nicomedia, in Bithynia, born about 100 A.D. He became a disciple of Epictetus, the Stoic philosopher, and, under his instructions, a warm advocate of that system. On bringing before the public the earliest products of his pen, the learned men of Athens were highly pleased with them, and honored him with the freedom of their city. A. had chosen Xenophon as his model of composition, and hence the Athenians called him the young Xenophon. In 124 A.D. he was introduced to the Emperor Hadrian in Greece, who conferred on him the freedom of the eternal city. He was appointed prefect of Cappadocia in the year 136. Under Antoninus Pius, the successor of Hadrian, he was promoted to the consulship. But some four years afterwards, he appears to have retired from public life, and devoted himself to literature in his native place. As the pupil and friend of Epictetus, he edited the Manual of Ethics (*Encheiridion*) left by his master, and wrote the *Lectures of Epictetus*, in eight books, of which only four have been preserved—to be had in Schweighäuser's *Philosophiæ Epictetæ Monumenta*, vol. iii. (Paris 1827). He wrote also *The Conversations of Epictetus*, a work which has been lost, except a few fragments. The most important work by A. is the *Anabasis of Alexander*, or *History of the Campaigns of Alexander the Great*, which has come down to us entire, all but a gap in the 12th chapter of the 7th book. This book is our chief authority on the subject of which it treats, and is a work of great value. In close connection with it, A. wrote his *Indian History*, giving an account of the people of India. Other writings by A., his letter to Hadrian on *A Voyage round the Coasts of the Euxine Sea*, and another *A Voyage round the Coasts of the Red Sea*, are valuable with regard to ancient geography. There is still another work by our author—a Treatise on the Chase (*Kynegeticos*)—in which, as well as in the *Anabasis*, he has imitated Xenophon.

A. was one of the best writers of his day. His works bear the marks of care, honesty, and correctness; and they were numerous, though several have not been handed down to our time. All that we are possessed of appear to have had translations into

Latin. There is a good French translation of the *Anabasis* by Chaussard, with commentary, 3 vols. (1802), and also a good one of the *Lectures of Epictetus* by Thurot (1838). The best critical edition of A. is that of Müller (Paris, 1846).

ARRO'BA, a weight commonly used in Spain, Portugal, Brazil, and in the principle Spanish and Portuguese colonies. In the first of these countries, it is equivalent to the English quarter of a cwt., or 28 lbs.; it is nearly the same in Portugal, &c. In Spain, the A. is also a measure for wine, brandy, &c., and contains four of our quarts.

ARRONDISSEMENT (from the French *arrondir*, to make round), the subdivision of a French Department (q. v.).

ARROW. See BOW AND ARROW.

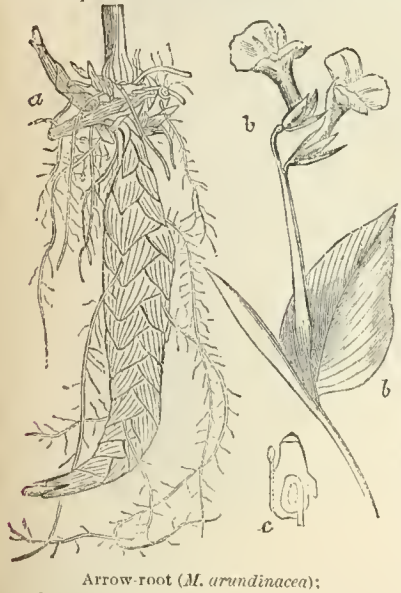
A'RROWHEAD (*Sagittaria*), a genus of plants of the natural order *Alismaceæ*, distinguished by unisexual flowers, having three herbaceous sepals and three colored petals, numerous stamens, and numerous carpels, which are compressed, one-seeded, and on a globose receptacle. They are aquatic, natives of very different climates, from the tropics to the cold regions of the world. The COMMON A. (*S. sagittifolia*) is a beautiful aquatic, a native of England, with arrow-shaped leaves which rise above the surface of the water. It is one of those plants which have enjoyed an undeserved reputation as cures for hydrophobia. The corms (or solid oulbs), dried and powdered, have sometimes been used for food, but have an acrid unpleasant taste.—The CHINESE A. (*S. Sinensis*) is a native of China, and has long been cultivated in that country and Japan for its eatable corms, which, in a fresh state, are somewhat acrid, but abound in starch. It has arrow-shaped acute leaves, and a branched polygonal scape (leafless stem). It is grown in ditches and ponds. It is one of the plants sometimes cultivated in tanks in the hot-houses of Britain.

ARROW-HEADED CHARACTERS. See CUNEIFORM.

ARROW-HEADS. See ELF-ARROW-HEADS.

A'RROW-ROOT is a variety of starch extracted from the roots of certain plants growing in tropical countries. It is a fine starchy farina, much valued as a delicacy, and as an easily digestible food for children and invalids. It is obtained from the tuberous roots —or more correctly, root-stock (*rhizomes*)—of different species of the genus, *Maranta*, belonging to the natural order *Marantaceæ*, and characterized by solitary ovules, a fleshy style curved downwards, branching stems, and white flowers. The species chiefly yielding it is *M. arundinacea*, a native of tropical America, cultivated in the West India Islands, and growing about two feet high, with ovato-lanceolate somewhat hairy leaves, clusters of small flowers on 2-flowered stalks, and a globular fruit about the size of currants. The roots (or rhizomes) contain a large proportion of farina. They are often more than a foot long, of the thickness of a finger, jointed, and almost white, covered with pretty large paper-like scales. They sometimes curve so that the points rise out of the earth, and form new plants. They are dug up when a year old, washed, carefully peeled, and reduced to a milky pulp. Mills for this purpose have been introduced; but in Jamaica the roots are usually reduced by beating in deep wooden mortars; in Bermuda, by means of a wheel-rasp.

The pulp is then mixed with much water, cleared of fibres, by means of a sieve of coarse cloth or hair, and the starch is allowed to settle to the bottom. The water dissolves, and so removes the greater part of the albumen and salts, the starch quickly settling down as an insoluble powder. Successive washings are employed for further purification. The A. is finally dried in the sun or in drying-houses, great care being taken by means of gauze, to exclude dust and insects. The careful peeling of the roots is of great importance, as the skin contains a resinous matter, which imparts a disagreeable flavor to A. with which it is allowed to mix. Great care is taken to preserve the A. from impurities; and the knives used in peeling the roots, and the shovels used in lifting the A., are made of German silver. The West Indian A., most esteemed in the market, is grown in Bermuda; the next, and almost equal to it, in Jamaica. The East Indian A. is not in general so highly valued, perhaps because substitutes for the genuine A. more frequently receive that name. The *Maranta arundinacea* is now, however, cultivated to some extent both in the East Indies and in Africa. *M. Indica*, which was supposed to be distinct from *M. arundinacea*, is now regarded as a mere variety of it, with perfectly smooth leaves. It is cultivated both in the East Indies and in Jamaica. A. is obtained also from *M. Allouyia* and *M. nobilis* in the West Indies, and from *M. ramosissima* in the East.



Arrow-root (*M. arundinacea*): *a*, tubers; *b*, leaf and flowers; *c*, stamen and style.

The amount of fecula or starch present in the roots of the *Maranta* varies according to age, and runs from 8 per cent., in those of the young plant, to 26 per cent, when full grown. The latter stage is reached when the plant is 10 to 12 months old; and the roots then present the following composition in 100 parts :

Starch, fecula, or arrow-root	26
Woody fibre	6
Albumen	1½
Gummy extract, volatile oil, and salts	1
Water	65½

A. is exported in tin cases, barrels, or boxes, carefully closed up. It is a light, opaque, white powder, which, when rubbed between the fingers, produces a slight crackling noise, like that heard when newly fallen snow is being made into a snow-ball. Through the microscope, the particles are seen to be convex, more or less elliptical, sometimes obscurely triangular, and not very different in size. The dry farina is quite inodorous, but when dissolved in boiling water, it has a slight peculiar smell, and swells up into a very perfect jelly. Potato-starch, with which it is often adulterated, may be distinguished by the greater size of its particles, their coarser and more distinct rings, and their more glistening appearance. Refined sago-flour is used for adulteration, many of the particles of which have a truncated extremity, and their surface is irregular or tuberculated. A is also sometimes adulterated with rice-starch and with the common starch of wheat-flour.

Not less than 800,000 lbs. of A. are annually imported into the British Isles. As an article of diet, it is often prepared for invalids and children by merely dissolving it in boiling-water and flavoring with sugar, lemon-juice, wine, &c. It is also often prepared with milk, made into puddings, &c. When most simply prepared, it forms a light meal, which, however, is not very nutritious. See NUTRITION.

A farina somewhat similar to A., and partly known by the distinct name of *Tous-les-mois*, is obtained from some species of the allied genus *Canna* (q. v.). But East India A. is in part obtained from the tubers of *Curcuma angustifolia*. Other species of *Curcuma* (see TURMERIC), as *C. Zerumbet*, *C. leucorhiza*, and *C. reubescens*, also yield a similar farina; the same tubers which, when young, yield a beautiful and pure starch, yielding turmeric when old. In Travancore, this starch is a principal part of the food of the inhabitants. The young tubers of the Galangal (q. v.) (*Alpinia Galanga*), another plant of the same natural order (*Scitamineæ*), are another source of this farina.—A farina somewhat resembling A., and often sold under that name, is obtained from different species of the natural order *Cycadaceæ*, as from the dwarf fleshy trunks of *Zamia tenuis*, *Z. furfuracea*, and *Z. pumila* in the West Indies, and from the large seeds of *Dion edule* in the lowlands of Mexico. —The starch of the Cassava, Manihot or Manioc (see MANIOC), is sometimes imported into Europe under the name of Brazilian A. Potato-starch, carefully prepared, is sometimes sold as English A.; and the farina obtained from the roots of the *Arum maculatum* (see ARUM), as Portland A. Otaheite A. is the starch of *Tacca* (q. v.) *pinnatifida*.—All these, as well as Oswego and Chicago corn-flour—the starch of maize or Indian corn—are so nearly allied to true A. as not to be certainly distinguishable by chemical tests; but the forms of the granules differ, so that they can be distinguished by the microscope.

The name A. is commonly said to have had its origin from the use of the fresh roots by the South American Indians as an application to wounds to counteract the effects of poisoned arrows; and the expressed juice has been recently recommended as an antidote to poisons, and a cure for the stings and bites of venomous insects and reptiles. But it is not improbable that the name is really another form of *Ara*, the Indian name.

ARRO'YO MOLI'NOS, a village in Estremadura, Spain, noted as the scene of General Girard's complete discomfiture by Lord Hill on the 28th October 1811. General Girard had been sent out by Soult on a plundering foray with 5000 men, when he was surprised early in the morning by Lord Hill, who had slept a league off at Alcuescar; the natives of which had the good sense not to betray the presence of their deliverers. With a couple of regiments, the 71st and 92d, the English general dashed through the rain upon the enemy, who fled in all directions, leaving behind everything, arms, packs, &c. 1300 prisoners were taken; the whole artillery, colors, baggage, &c. French historians (Thiers, &c.), however, maintain that the battle was 'undecided,' and that

their countrymen only retreated in good order, under the pressure of much larger forces.

ARRU' ISLANDS, a Dutch possession, south of New Guinea, between 5°—7° S. lat., and 134°—135° E. long.; area, 1365 sq. m.; pop. 13,819, of whom 300 are Christians, 180 Mohammedans, the remainder heathens. Principal islands are Meykor, Wammer, Udjier, Wokkam, and Babi. Dobo on Wammer is the chief mart. Sago and coco-nut palms are plentiful, and some tobacco, rice, sugar-cane, maize, and edible roots, &c. are cultivated. The forests yield timber, and the sea, fish. The rocks give edible nests, and the woods shelter wild swine, hares, parrots, pigeons, birds of paradise, &c. Cotton goods, iron and copper wares, Chinese pottery, beads, knives, rum, and arrack are imported, and bartered for mother-of-pearl, trepang, edible nests, pearls, tortoise-shell, birds of paradise, &c.

ARSA'CES, a name common to several Parthian and Armenian kings. The accounts concerning them which have been transmitted to us by the ancient historians are exceedingly vague, confused and contradictory; and modern criticism has found itself unable to reconcile or simplify the conflicting statements. The most important members of the dynasty of the Scythian Arsacidæ were A. I. and A. VI.

ARSACES I., the founder of the Parthian monarchy, flourished in the 3d c. B.C., under the reign of Antiochus-Theos. An atrocious insult offered to his brother Tiridates by Pherecles or Agathocles, Macedonian satrap of the country, is said to have fired his spirit, and driven him to rebel. The Macedonians were expelled, 256 B.C. Antiochus, embroiled in a war with Egypt, could not immediately find time to attempt the recovery of this portion of his dominions. Seleucus, the son of Antiochus, made two unsuccessful expeditions against the insurgent chief, in the last of which he was taken prisoner. A. I. now acquired regal power, built a city called Dara, on the mountain Zapaortenon, developed the internal resources of his new kingdom, and endeavored to organize it; and after the conquest of several countries, died at a great age. Such, at least, is the account given by Posidonius, &c.: but Arrian states that A. died after a reign of two years, and that his brother Tiridates succeeded him, under the name of A. II., and ruled for thirty-seven years, whence we may conclude that many of the acts attributed to the founder of the Parthian kingdom were the work of his successor.

ARSACES VI., or MITHRIDATES I., flourished about the middle of the 2d c. B.C. He enlarged the territories of the Parthians by the conquest of Bactria; and is even supposed to have penetrated into India, and subdued the nations between the Hydaspes and Indus. In the year 138 B.C., he defeated and took prisoner Demetrius Nicator, king of Syria, whom, however, he treated generously, bestowing on him his daughter in marriage. He was a just and merciful prince, and an enemy to luxury.

A'RSENAL is the name given to a great military or naval repository, where the munitions of war are to some extent manufactured, but more particularly stored until required for use. Every royal dockyard, every magazine, every armory, is to some extent an A.; and therefore the meaning of the word is not quite definite. In France, the chief arsenals are at Cherbourg, Brest, and Toulon. In England, although Deptford is a considerable storehouse for naval clothing and provisions, and Weedon and the Tower great repositories for military stores, the only establishment vast enough to deserve the name of A. is at Woolwich. This is truly a remarkable and important place. In the spring of 1859, when war was raging in Italy between the French and Sardinians on one side, and the Austrians on the other, and when an uneasy feeling pervaded our own country, there were for a short time more than 10,000 men employed in Woolwich A. There were at that time nearly 12,000 pieces of iron ordnance in store, of which 7000 were of modern make and of heavy calibre. This store was supplementary to that which is always kept at the dockyards of Woolwich, Chatham, Sheerness, Portsmouth, Plymouth, and Pembroke. There were resources at the A. for bringing forward, fitting, and issuing these reserve guns at the rate of 200 per week, or double this number on an emergency; and many hundreds were within a brief period shipped thence, to strengthen our forts in the Mediterranean, in the colonies, and around the coasts. All the shot and shell used down to the period of the Crimean war, were ordered of private makers; but the charge was so enormous during the early months of that war, that the government resolved to try the manufacture at Woolwich; this was done, with a very manifest saving of expense. It has been calculated that the A., when at full work, could produce large shot and shell with six times the rapidity with which those missiles were used by the British outside Sebastopol during the eleven months' siege. These observations do not apply to rifles or muskets; none of these weapons are made at Woolwich. There have been times in the history of this country when nearly a *hundred million* rifle-bullets were in store at the A. The Arsenal is divided into two great sections, of which the one is the depot for the storage of arms and all military equipments, whether for land or naval service; the other being occupied by the manufacturing departments. The latter comprise the gun factories, where all cannon are made; the carriage department, for gun-carriages and all means of transport; and the laboratory, whence come all cartridges, shot, shell, bullets, and warlike weapons. See ARSENAL in AM. SUPP.

A'RSENIC is the name applied in popular language to a well-known poisonous substance, Arsenious Acid (q. v.), but, strictly speaking, the term is restricted to the metal, of which the symbol is As and the equivalent is 75·0. The metal A. is rarely found free in nature, but in a state of combination it occurs largely (see ARSENICAL MINERALS). The metal is generally prepared from arsenious acid (AsO_3) by mixing it with its own weight of charcoal, placing the mixture in a well-covered crucible, and subjecting the whole to heat, when the metal set free by the charcoal rises, and condenses in the upper part or cover of the crucible. Metallic A. is very brittle, can easily be reduced to powder by hammering, or even pounding in a mortar; and when a freshly cut surface is examined, it presents a brilliant dark steel-gray lustre, which, however, readily tarnishes on exposure to the air. The metal, as such, is not considered poisonous, but when introduced into the animal system, it is there faintly acted upon by the juices, and in part dissolved, at the same time, exhibiting poisonous properties. When heated in the open air, it burns with a peculiar bluish flame, and emits a characteristic alliaceous odor. The only use to which the metal A. is applied in the arts is in the manufacture of leaden shot of various sizes, when its presence in small quantity in the lead renders the latter much more brittle than it ordinarily is. Of all the compounds of A. the most important is the one already alluded to—namely, Arsenious Acid, which is an oxide of A. With sulphur, A. forms two important compounds: *Realgar* (AsS_2), a red, transparent, and brittle substance, which is employed in the manufacture of the signal-light called *White Indian Fire;* and *Orpiment* (AsS_3) or *King's Yellow*, a cheap pigment of a yellow color. With hydrogen, A. forms arseniuretted hydrogen (AsH_3), a very poisonous gas, and one which has been fatal to several chemists.

Native Arsenic.

ARSE'NICAL MINERALS occur chiefly in primitive rocks, and frequently associated with other metalliferous minerals.—*Native Arsenic*, although nowhere very abundant, is not unfrequently found in mines in Europe, Asia, and America, generally along with sulphur and metallic sulphurets. In Britain, it occurs at Tyndrum in Perthshire. It has usually a fine granular character. It is very seldom, if ever, quite pure, usually containing a little antimony and iron, and not unfrequently a very little silver or gold.—A very similar, and still rarer metal, found in similar situations, is known as *Arsenic-antimony*, and consists of about two parts of metallic arsenic, and one of metallic antimony.—*Arsenic-silver*, or *Arsenical Silver*, is another very rare mineral, consisting chiefly of arsenic and iron, but containing also about 13 per cent. of silver and a little antimony.—*Arsenic-glance*, found at Marienberg in Saxony, and containing about 3 per cent. of bismuth, has the remarkable property of taking fire at the flame of a candle.—*Arsenious Acid* occurs native in a few localities in Germany and France, and as a mineral species, has received the name of *Arsenite*, which perhaps too closely resembles the chemical designation of its salts.—*Arsenic Acid*, another compound of arsenic and oxygen (AsO_5), containing more oxygen than arsenious acid, although it does not itself occur native, is not unfrequent in the form of compounds with copper and lead (*Arseniates* of copper and lead), which enter into the composition of a number of minerals, none of them so abundant as to be of any importance.—Among A. M. are also to be ranked the compounds of arsenic with sulphur, particularly *Orpiment* (q. v.), *Realgar* (q. v.), and *Dimorphine*, a rarer mineral than the other two, and therefore less important.—But the most important of all A. M., because of their use as ores of arsenic, for the preparation of white arsenic, or arsenious acid, are those in which arsenic is combined with nickel and cobalt. One of these is *Arsenical Pyrites*, or *Leucopyrite*, found in various mines of the continent of Europe, and containing arsenic, iron, sulphur, nickel, and cobalt, in somewhat various proportions—the arsenic, however, always the principal constituent. It generally occurs massive.—*Mispickel*, which frequently occurs in rhombic crystals, but often also massive, differs from it in containing a considerable quantity of silver, so that it is used both as an ore of arsenic and of silver. It is found in many of the tin-mines of Cornwall, and is pretty frequent in different parts of the world.—*Nickeline* consists of nickel and arsenic, and is used as an ore of nickel, and also

for the preparation of white arsenic.—*Cobaltine* and *Smaltine*—the former consisting of cobalt, sulphur, and arsenic; the latter, of cobalt and arsenic—are used for the preparation of blue colors for porcelain and stoneware. Both are found in Cornwall; they occur also in some of the mines of the continent of Europe, and in other parts of the world.—The presence of arsenic in a mineral may commonly be detected by the alliaceous odor which it emits before the blow-pipe.

ARSE'NIOUS ACID is the arsenical compound most familiarly known. It is obtained principally during the roasting of the arsenical nickel ores in Germany in furnaces communicating with flues. When the arsenic of the ore burns, it passes into the condition of A. A. (AsO_3), and rising as vapor into the somewhat cool flue, is there deposited as a grayish powder, known by the names of *Smelting-house Smoke, Flowers of Arsenic, Poison-flour*, or *Rough A. A.* In this condition, the A. A. is contaminated with some impurities, from which it may be separated by introducing the gray powder into an egg-shaped vessel, and applying heat at the lower end, when the A. A. rises in vapor, and condenses in the cool end as a transparent glassy or vitreous substance. Ordinary A. A. of the shops (which is what is popularly known as *arsenic*) is a white crystalline powder, which feels decidedly gritty, like fine sand, when placed between the teeth, and has no well-marked taste. It is very heavy, so much so as at once to be noticable when a paper or bottle containing it is lifted by the hand. It is soluble in water to the extent of 1 part of A. A. in about 100 parts of cold water, and 1 part of A. A. in about 10 parts of boiling water. As ordinarily sold in quantities under 10 lbs. in weight, the A. A. is required by law to be colored with $\frac{1}{320}$ of its weight of indigo, or $\frac{1}{16}$ of its weight of soot; the object of the admixture being to render any liquid to which the A. A. might be added, with a murderous intent, of a black or bluish-black hue, and thus indicate the presence of something unusual. In packages of 10 lbs. and upwards, A. A. is allowed to be sold in the pure white crystalline form without coloration. When placed in a spoon, or other vessel, and heated, the A. A. volatilizes, and condenses in crystals on any cool vessel held above. By this means, it can be distinguished from ordinary flour, which, when heated, would char, and leave a coal behind; and from chalk, stucco, baking-soda, tooth-powder, and other white substances, which, when heated, remain in the vessel as a non-volatile white residue. Again, when A. A. is placed on a red-hot cinder, and the escaping vapors cautiously brought under the nostrils, the strong alliaceous odor characteristic of arsenic is given off. The mode in which A. A. comports itself, when thrown upon water, is likewise peculiar. Instead of at once descending through the water like sand, the A. A., notwithstanding its great density (sp. gr. 3·70), partially floats on the surface, as wheat-flour does; and that portion which sinks in the water, rolls itself into little round pellets, which are wetted only on the outside, and contain much dry A. A. within. The solution of A. A. in water is recognized by three tests:

1. Hydrosulphuric acid and hydrochloric acid produce a *yellow precipitate* of sulphuret of arsenic (AsS_3), soluble in ammonia.

2. Ammonio-sulphate of copper, an *apple-green precipitate* of arsenite of copper ($2CuO,AsO_3$).

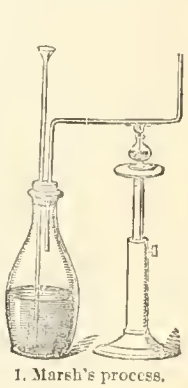
3. Ammonio-nitrate of silver, a *yellow precipitate* of arsenite of silver ($2AgO,AsO_3$).

In many cases, A. A. is used as a means of destroying animal life, but, happily, the processes for the detection of the poison in organic mixtures and in the animal tissues are so unerring and trustworthy, that it is hardly within the range of possibility that an animal can be destroyed by the administration of A. A. without very decided evidence of the existence of the poison being obtained on examination of the various parts of the animal structure; indeed, it may be safely said that there is no limit to the detection of the poison, as even after the animal structure has been so far decomposed that little remains, yet still the poison, from its indestructibility, survives, and will indicate itself clearly, on the application of the several tests.

For the isolation and recognition of A. A. in organic mixtures, such as the contents of a stomach, three processes may be followed. The method generally pursued, and that upon which greatest dependence is placed, is called Reinsch's process, from the name of its discoverer. The manner of its application is to treat the organic mixture with water sufficient to render it thin, then add hydrochloric acid to the extent of one-eighth of the volume of the liquid; apply heat, and when the whole has been raised to near the boiling-point, introduce clean, newly burnished pieces of copper in the form of wire, gauze, or foil. If A. A. be present in the mixture, a steel gray coating of metallic arsenic will form on the surface of the copper. This apparent tarnishing of the copper may take place when no A. A. is in the mixture, and may be produced by salts of mercury, antimony, &c., as well as by sulphur compounds, and even occasionally by fatty matters. To distinguish between the coating formed by A. A. and that produced by other substances, the copper is taken out of the mixture, washed with water, to remove acid; immersed in ether, to dissolve off any adherent fatty matter; dried between folds of blotting-paper; introduced into the lower end of a dry glass test-tube, and there cautiously heated. The metallic arsenic (As) is driven off by the heat from the surface of the copper, rises in vapor into the upper portions of the test-tube; there meets the oxygen of the air, with which it combines, forming A. A. (AsO_3), and thereafter deposits itself on the inner surface of the cool part of the tube in little glistening crystals. On allowing the tube to cool, adding water thereto, and applying heat, the water dissolves the crystals of A. A., yielding a solution, to separate portions of which, the liquid tests mentioned above may be successfully applied. This process may likewise be employed in the detection of A. A. in animal tissue, as in the liver, spleen, kidneys, &c., by first dividing the animal matter into small pieces, and thereafter treating with water, hydrochloric acid, and copper. The precautions which require to be exercised in trying this process are, that the hydrochloric acid and copper are themselves free from A. A. Hydrochloric acid has long been known to be liable to contain at times a very sensible proportion of the poison, and it is therefore necessary, before using the acid in any experiment, to make a preliminary trial with dilute hydrochloric acid, into which, when heated, a piece of copper is immersed; and if no tarnishing occurs after a quarter of an hour's trial, the acid may be declared free from contamination with arsenical compounds.

The liability of copper to contain arsenic some years ago (August 1859) assumed importance in connection with a trial for murder by slow poisoning with arsenic which took place in Britain. In this case, a considerable amount of copper was dissolved during the testing, and supplied the poison in quantity enough to produce a faint coating on a piece of copper which was subsequently introduced into the liquid. The result was that A. A. was at first declared to be present in the material under examination; but further experiments demonstrated that the copper itself had afforded the arsenic. To free copper from any arsenic which it may contain originally, it is only necessary to heat the copper over a gas or spirit-lamp flame, when the arsenic volatilizes, and leaves the copper uncontaminated therewith.

The other two processes for the detection of A. A. in organic mixtures are—1. That recommended by Marsh, in which the material is treated with dilute sulphuric acid and metallic zinc in a gas-generating apparatus, when the arsenic combining with hydrogen, forms arseniuretted hydrogen (AsH_3), from which, in the act of escaping, the metallic arsenic, and subsequently A. A., can be obtained; and 2. That known as Berzelius's process, in which dry arsenical compounds are mixed with a reducing flux, and heated in a constricted tube, when the metal arsenic is produced, which in its turn is converted into A. A. by heating in a wide test-tube. The processes of Marsh and Berzelius are not so generally followed as that of Reinsch; but in each and all it is absolutely necessary, in order to avoid the possibility of mistake, (1), that metallic arsenic be obtained from the organic mixture; (2), that the metallic arsenic be converted into A. A.; and (3), that this A. A. treated with water, should yield a solution which will give the three liquid tests mentioned previously.



1. Marsh's process.

2. Berzelius's process.

A. A. forms compounds (salts) with alkalies and other bases, which are called Arsenites. Some of these are employed in commerce and medicine. A. A., boiled with a solution of potash, or carbonate of potash, forms an arsenite of potash, used in medicine, and known as *Fowler's Solution*. The more largely used sheep-dipping mixtures are composed of A. A., soda, sulphur, and soap, which, when used, are dissolved in a large quantity of water, and thus constitute essentially dilute solutions of arsenite of soda. A compound of A. A. and the oxide of copper, called the arsenite of copper or *Scheele's Green*, is a pigment largely used by painters as a pretty and cheap green paint. The same substance is extensively employed in the manufacture of common green paper-hangings for the walls of rooms; and recent inquiries would lead to the belief that rooms covered with paper coated with this green arsenite of copper are detrimental to the health of the human beings residing therein, from the readiness with which minute particles of the poisonous pigment are detached from the walls by the slightest friction, are diffused through the room, and ultimately pass into the animal system. Another green pigment is named *Schweinfurth Green*, and contains A. A., oxide of copper, and acetic acid, and is a double arsenite and acetate of copper.

ARSENIC (ARSENIOUS ACID). *Properties of, as a Drug.*—A. has long been used as a medicine. When taken into the stomach, it is soon absorbed into the blood, and circulates with that fluid, exhibiting great power over certain diseases, especially skin diseases, as psoriasis, lepra, eczema (q. v.), &c. It is also classed among the tonic minerals, and given for nervous disorders, especially those that are periodic. Of late it has been much recommended for rheumatism; and Dr. Begbie, of Edinburgh, considered that among the remedies for chorea (St. Vitus' dance) it holds the foremost place. In ague, also, and remittent fever, as well as in other disorders originating from the same source, A. and quinine are our chief remedies. They are considered to act as alteratives of the blood. The usual method of administering A. is in small doses (from three to five drops) of the liquor arsenicalis, largely diluted with water, twice or thrice in the day. Arsenic is sometimes given combined with iodine and mercury (Donovan's solution).

When given in the doses above mentioned, for eight or ten days, symptoms of poisoning begin to appear; the skin becomes hot, the pulse quick, the eyelids hot and itchy; the tongue has a silvery appearance; the throat is dry and sore, the gums swollen and tender; and if the treatment is persisted in, salivation ensues, and then come nausea, vomiting, diarrhœa, nervous depression and faintness (Begbie). The quantity necessary to destroy life, of course, varies. Dr. Christison records the case of a man who died in six days, after taking thirty grains of the powdered white A.; but a much smaller dose will prove fatal; a girl was killed with two grains and a half of A. contained in two ounces of tly-water. According to Dr. Swaine Taylor, a medical witness is justified in stating, that under circumstances favorable for its operation the fatal dose for an adult is from *two* to *three grains*. Death from a poisonous dose of A. may occur in a few hours, or after the lapse of days. A woman, aged 56, used a solution of A. in water to cure the itch; she experienced severe suffering, and died after two years, having had symptoms of arsenical poisoning all that time.

A. has been used frequently as a slow poison, the symptoms being attributed to inflammation of the bowels from natural causes. Fortunately, in most cases its detection is easy. Orfila found A. in the soil of cemeteries, a fact which has created some discussion among toxicologists. A. is used by anatomists as an antiseptic, but is dangerous, as it is apt to get into cuts on the hands, and under the finger nails, and cause disagreeable symptons. It is stated that in some countries, especially in Styria, A. is taken by the young female peasants to increase their personal attractions; a statement which probably amounts to this, that experience of its tonic and other qualities induces some individuals to prescribe for themselves a medicine which ought only to be administered by a skilful and cautious hand. That A. can be taken habitually for any length of time, would seem a physiological impossibility; and yet such statements are made on what appears to be unquestionable authority. See *Chambers's Journal*, Vol. V. p. 90, and VI., p. 46; also Johnston's *Chemistry of Common Life*.

No effective chemical *antidote* for A. has yet been discovered. In case of an overdose, or of intentional poisoning, the following treatment is recommended: Evacuate the stomach with the stomach-pump, using lime-water; administer large draughts of tepid sugar and water, chalk and water, or lime-water; avoid the use of alkalies, but administer charcoal and hydrated sesquioxide of iron; bleed freely; take a tepid bath, and use narcotics. If the fatal symptons be averted, let the patient for a long time subsist wholly on farinaceous food, milk, and demulcents.

ARSI'NOE. the daughter of Ptolemy I., king of Egypt, and of Berenice, was born about 316 B.C., and married in her sixteenth year to the aged Lysimachus, king of Thrace, whose eldest son, Agathocles, had already wedded Lysandra, the half-sister of A. Desirious of securing the throne for her own children, A. prevailed on her husband to put Agathocles to death; the consequences of which crime, however, were fatal to the Thracian monarch; for Lysandra, having fled with her children to Seleucus in Asia, managed to induce him to declare war against her unnatural father-in-law. Lysimachus was slain, and Seleucus seized the kingdom. A. now sought refuge in Macedonia, which, however, was also taken possession of by Seleucus; but on the assassination of the latter, after a few months, by Ptolemy Ceraunus, the half-brother of A., she received a hypocritical offer of marriage from Ptolemy, who wanted to destroy her two sons, lest they should prove formidable rivals to his ambition. She consented to the union, and opened the gates of the town in which she had taken refuge, but her children were butchered before her eyes. She then fled to Egypt (279 B.C.), where she married her own brother, Ptolemy II. Philadelphus. These unnatural unions subsequently became common among the Greek kings of Egypt. It does not appear that A. had any children by her brother, though she was regarded by him with the deepest affection. He named several cities, and also an entire district, by her name. After her death, he ordered Dinochares, the architect, to build a temple to her memory, and roof the edifice with loadstones, so that her iron statue might seem to float in the air.

A'RSIS AND THE'SIS (Gr. raising up, and laying down), a term in music applied to the rising and falling of the hand in beating time. It is also applied to the elevation and depression of the voice in speaking.

A'RSON, or, as it is called in Scotland, *wilful fire-raising*, is according to the laws of all civilized countries, a crime of the deepest atrocity; for it involves in its consequences not only the destruction of property, but also the destruction of, or at least an indifference to, the life or lives of others, which can only be imputed to the most wicked and malignant spirit. In the criminal law of England, it is a felony, and has been described as the malicious and wilful burning of the house or building of another man. It is essential to the offence that the house or building burned should be that of *another;* for although it is a misdemeanor to destroy one's own house by fire, especially in a town, or where other buildings are contiguous, which are thereby put in danger, such an offence does not amount to a felony, strictly so called. To constitute such felony, there must be an *actual* burning; for no intent, however clear, would suffice at common law to support a charge of A. This crime is the subject of express statute (the Consolidation Act, 24 and 25 Vict. c. 97), the provision of which considerably modify and enlarge the doctrines of the common law on the subject. The chief of the enactments of this, the Malicious Injuries to Property Act, enacts that whoever shall unlawfully and maliciously set fire to any dwelling-house, any person being therein, shall be guilty of felony, and liable to penal servitude. Also that whoever shall unlawfully and maliciously set fire to any church or chapel; or to any chapel for the religious worship of persons dissenting from the United Church of England and Ireland; or to any house, stable, coach-house, out-house, warehouse, office, shop, mill, malt-house, hop-oast, barn, or granary; or to any erection used in carrying on any trade or manufacture, or any branch thereof, whether in possession of the offender or any other person—with intent, in the latter cases, to injure or defraud any person, shall be guilty of felony; and he is liable to penal servitude for life, or not less than three years, or to imprisonment not exceeding two years. Doubts having arisen on a former act, whether its provisions extended to the setting fire to a hovel or shed not appendant to any house, it was expressly provided, by the above act, that whoever should unlawfully and maliciously set fire to any hovel, shed, or fold; or to any farm-building; or any building or erection used in farming land—whether the same, or any of them respectively, shall then be in the possession of the offender, or the possession of any other person—with intent thereby to defraud any person, shall be guilty of felony, and he is liable to a like punishment.

Moreover, that whoever shall unlawfully and maliciously set fire to any hay, straw, wood, or other vegetable produce, being in any farmhouse or farm-building; or to any implement of husbandry, being in any farmhouse or farm-building; with intent to set fire to such farmhouse or farm-building, and to injure or defraud any person—shall be liable to the same punishment as for setting fire to the farmhouse or farm-building itself; and every male so offending, under sixteen, shall be also liable, at the discretion of the court, in addition to any other sentence, to be whipped. Again, unlawfully and maliciously, by any overt act, to attempt to set fire to any building, stack, or steer, or vegetable produce, of such kind and with such intent that if the offence were complete, the offender would be guilty of felony, and liable to penal servitude for life (though such building, stack, steer, or vegetable produce be not actually set on fire), is deemed felony and is punishable with penal servitude above three years; or imprisonment for two years, with the same addition in respect to whipping, if the offender be a male under sixteen. And lastly, if any person shall maliciously set fire to any station or other building belonging to any railway, dock, canal, or other navigation, he is guilty of felony; and he is liable to penal servitude for life, or any term not less than three years; or to be imprisoned, with or without hard labor, for any term not exceeding two years; and if any person maliciously set fire to any *goods* or *chattels* being in any building, the setting fire to which is felony by act of parliament, he is guilty of felony; and he is liable to penal servitude for any term not exceeding 14 years, nor less than three years, or to be imprisoned, with or without hard labor, for any term not exceeding two years.

Servants convicted of negligently setting fire to houses and buildings, shall, by 14 Geo. III. c. 78, s. 84, forfeit £100, to be distributed among the sufferers, by the churchwardens, in such proportions as to such churchwardens shall seem just; and in case of default, shall be committed to jail or the house of correction for eighteen months, to be kept to hard labor.

It has been laid down in Scotland, that if the fire has been wilfully kindled, it matters not how circuitous may have been the mode of operation selected, although the injury intended to have been done was not the actual burning of the house, but some inferior mischief. And it is the law of both countries, that if the

proprietor of a house set fire to it while in possession of a tenant holding under a lease, the crime of A. is completed; and in Scotland, the same has been ruled where the house was occupied by a party having a life-interest in it.

By the 29 Geo. III. c. 46, an act which applies to Scotland as well as England, it is enacted, that if any person shall maliciously and unlawfully set fire to, or in any wise destroy, any ship or vessel, whether the same be complete or in an unfinished state, or shall maliciously and unlawfully set fire to, cast away, or in anywise destroy any ship or vessel, with intent thereby to prejudice any owner or part owner of such ship or vessel, or of any goods on board the same, or any person that hath underwritten, or shall underwrite any policy of insurance upon such ship or vessel, or on the freight thereof, or upon any goods on board the same; every such offender shall suffer death as a felon.*

Both in England and Scotland, it is a considerable aggravation of the offence where the burning is to defraud insurers.

ART. The word A. is here meant as designating what is more specifically termed Fine A., being opposed to the useful arts, or the industrial operations for supplying the common necessities of life. Painting and Poetry are fine arts; Agriculture, Navigation, and Medicine are useful arts.

The great end of A. is to give pleasure, but the kind of pleasure is peculiar and circumscribed. There are many of our enjoyments that no artist would ever think of attempting to provide. The gratifications of eating and drinking, of exercise and repose, warmth and coolness, form a class in contrast with the pleasures of music, sculpture, or the drama. It is a matter of some nicety to draw the line between these two regions of our pleasurable susceptibility; indeed, it is not clear that a precise line can be drawn. Certain peculiarities can be assigned as disqualifying circumstances, such that any mode of pleasure laboring under them is debarred from entering into A.; but after we have allowed for these, there will remain a disputed border-land, on which no general criterion will hold.

The various indulgences called sensual are the best examples of contrast to the pleasures of A. In the first place, as our frame is constituted, these bodily functions, while incidentally ministering to our pleasure, are in the main subservient to maintaining our existence, and being in the first instance guided for that special end, they do do not necessarily rank among our gratifications as such; in the second place, they are connected with the production of what is repulsive and loathsome, which mars their purity as sources of pleasure; and in the third place, they are essentially confined in their influence to the single individual; for the sociability of the table is an element superadded. Now, a mode of pleasure, subject to one or more of these three conditions may belong in an eminent degree to the list of utilities, and constitute an end of industry, but does not come under the class we are now considering. Wealth is disqualified by the third condition, inasmuch as, while in the shape of money, it is confined to some single proprietor. The same may be said of the pleasures of Power and Dignity. Even Affection is too exclusive to come under the artistic head. Anything so restricted in its sphere of action as to constitute individual property, and give occasion to envy and jealousy, is not a pleasure aimed at by the producer of Fine A.; for there do exist objects that can give us delight as their primary end, that have no disagreeable or revolting accompaniments, and whose enjoyment is not restricted to a single mind; all of which considerations obviously elevate the rank of such objects in the scale of our enjoyments. The landscapes, the glowing sunset, the song of the lark, the flowers of the field and the yard, yield unalloyed pleasure, and create no monopoly. The painter, sculptor, and musician aim at corresponding effects.

The eye and the ear are the chief avenues of artistic delight; the other senses are more or less in the monopolist interest. Moreover, one important feature in the somewhat capricious attribute termed *refinement*, attaches more particularly to the objects of these two senses; namely, the power of protracted enjoyment without fatigue. A *coarse* effect is one that is intense and pungent, but too exhausting to be kept up; such is a noisy clash of loud instruments in a musical performance, or a tale of overdone marvels. To remove all the fatiguing accompaniments, and thereby tone down the exciting influence, while retaining as much as possible the really pleasurable part, is to refine upon the effect, and produce a higher work of art. Now, in the sensation of taste and smell generally, the stimulus is apt to be of short duration; the pleasure is said to pall soon. Yet there are degrees in the case; some of the choicer odors can effect us for hours together with a gentle and pleasing sensation. But it is the ear, and perhaps still more the eye, that can remain open to agreeable stimulation for the greatest length of time; and taking this fact along with the unconsuming nature of their objects, we see good reasons for the artist striving so earnestly towards the gratification of those two senses.

* The statute 29 Geo. III., c. 46, has not been repealed, though there are similar enactments in the English Malicious Injuries to Property Act, but omitting the punishment of death.

The sensual elements can be brought into A. by being contemplated in the *idea*, in place of being enjoyed in the reality. A painter or poet may depict a feast to our minds, and impart a pleasure that differs essentially from the delights of eating and drinking. The imagined repast has nothing to do with our bodily necessities; the disagreeable accompaniments can be kept out of view; and any number of persons may share in the effect. So with the elements of wealth, power, dignity, and affection, which in their actuality want the liberal character of the true artistic delight; if we can only derive pleasure from the spectacle of them in the hands of the select number of their possessors, they become to us an enjoyment that can be shared by the general multitude, like the blue sky, or the towering peak. It is the fact that mankind find a charm in contemplating the wealthy, the powerful, the elevated, the illustrious, the beloved; and accordingly such elements are freely adopted into artistic compositions.

If all the sensual gratifications could become artistic by being contemplated in idea, or merely thought of, as in the above case of imagining a rich feast, we should have the means of distinctly circumscribing the select region of the beautiful or artistic, and of resolving a difficult problem. It would be admissible for the poet or painter to suggest any of those inferior pleasures to the mind by descriptive touches, and he would thereby elevate them into the region of art. But we find that every mode of sensual gratification is not open to this ideal presentation. Even as regards eating and drinking, exception is taken against the too free allusion to those pleasures; while the sensuality of love is hardly to be suggested through the most distant allusion. We may revel in tales of mere tender emotion—of parental love and of pure affection—but those other subjects are kept at the utmost distance; and we should be said to be reveling in sensuality, if we were merely to indulge in the imagination of those species of delight. There is no help, therefore, but to consider that there are *conventional* and arbitrary limitation of the sphere of the artist, rendering it quite impossible to draw any clear and universal boundary-line between the beautiful and the agreeable generally.

Sublimity, Beauty, Grace, Harmony, Melody, Pathos, Ideality, Picturesqueness, Proportion, Order, Fitness, Keeping, and the Ludicrous—though they do not all relate to the so-called *beautiful*, are all involved in the circle of pleasures now before us; and it is quite obvious that no one fact can run through this variety of designations. There must be a great multitude of agents operating to produce these different impressions, which are related to one another only by attaching in common to the æsthetic class of compositions. Doubtless, several of these names may be employed to mean the same thing, in fact, partially synonymous terms; as Beauty and Grace—Proportion, Fitness, and Keeping; but hardly any two terms are synonymous throughout, and there are distinct conceptions implied in Sublimity, Beauty, Picturesqueness, Fitness, and the Ludicrous.

Among the elementary sensations and emotions of the human mind that are of a pleasurable kind, a certain number may enter at once into the composition of A.; such are the pleasures of sound and sight, the emotion of surprise, and plot-interest. Others may enter by ideal presentation; as the gratifications of the remaining senses, and the emotions of fear, tenderness, irascibility, power. The feelings more specific to A. are those produced by Harmony under its various aspects. When sweet sounds are harmoniously combined, we have the musical art; the painter has a similar aim in reference to colors and forms; and so through all the Fine Arts, this quality is found recurring as the crowning work of the artistic hand. Nothing is so indisputably included within the circle of the æsthetical or beautiful as finely struck harmonies, melodies, or concords. Whatever else may be included in a composition, it is the admission of these that gives the specific charm, although it would be a mistake to dispense with other elements of interest common to art and to every-day life. Story is essential to Romance and Poetry; sweetness in the separate sounds is requisite for good Music; and color in itself imparts æsthetic pleasure apart from harmonious union.

The agreeable effect designated by Fitness takes rank with the artistic pleasures; we may call it the æsthetic of the useful. When a work is not only done effectually, but done with the appearance of ease, or the total absence of restraint, difficulty, and pain, we experience a delight quite different from the satisfaction growing out of the end attained. Much of the pleasure of architectural support is referrible to this source.

Among the susceptibilities touched by artistic arrangements may be noticed the sense of Unity in multitude, arising when a great number of things are brought under a comprehensive design, as when a row of pillars is crowned by a pediment. The use of simple figures—the triangle, circle, square, &c.—for enclosing and arranging a host of individuals, has the tendency to make an easily apprehended whole out of a numerous host of particulars. In all large works abounding in detail, we crave for some such comprehensive plan, whereby we may retain the total, while surveying the parts. A building, an oratorio, a poem, a history, a dissertation

a speech, should have a discernible principle of order throughout; the discernment of which gives an artistic pleasure, even in works of pure utility.

The craving for Variety and Novelty is a powerful impulse of the human mind, and makes itself especially apparent in the appreciation of works of A. The greatest works cease to please after a time, and temporary fashion may occasionally lord it over the perennial in taste. In looking at the Fine Arts individually, we may divide them into two classes, by drawing a distinction of some importance as regards the question of an artistic *standard*. The one class contains the *effusive* arts, or those which consist of mere outbursts of the inward spontaneity, regulated by the effects of the display on the sense of the beholder or listener. Music is a good example. The spontaneous effusions of the human voice, and those prompted by the various emotions, are corrected and tuned by the ear into melody and harmony, and after this process has been often repeated, pleasing airs and compositions are the result. It is the same with the Dance, considered as a fine art. In like manner, dramatic gesture and display, and the graces of elocution and fine address, are the natural promptings rendered pleasing by being changed and modified for that express end. The first movements are mere random, but the delicate sensibility of the beholder causes some to be suppressed, and others brought out, until a really pleasing combination is attained. Contrasted with the purely effusive, are the so-called *imitative* arts, or those that involve the representation of some of the appearances of the outer world. Such are Painting, Sculpture, and Poetry. In these, the artist, while still aiming at pleasing effects, is trammelled with a new condition—namely, a certain amount of fidelity to his original. In the others, there are no originals. The musician imitates nothing, and is bound by the sole condition of gratifying the ear; but a painter chooses his subject from nature, and although he must contrive to yield the pleasures of color, outline, and grouping, he must do so with a certain respect to the object copied. The poet, in depicting the life of men, comes under the rule of fidelity to this extent, that an obvious misrepresentation is apt to give a painful shock, and mar the pleasure that would otherwise be derived from the poetry itself. It is not so much that truth is a part of the artistic pleasure, as that falsehood is a stumbling-block in the way; for even the imitative arts are only so in part. There is no imitation in the meter and cadence of a song, and yet these often constitute the main charm. So a certain license of fantastic effusion is allowed to poets, subject to no rules but the giving of pleasure. The creation of imaginary worlds, when avowed, is not objected to; and the criterion of fidelity to the actual is accordingly laid aside for the time. The various arts of Decoration and Design are for the most part effusive, although occasionally imitative. Architecture is not in any way imitative; the coincidence between the Gothic roof and the intermingling foliage of a double row of trees, is a mere accident.

These observations are necessary in order to qualify the current maxim, that Nature is the artist's standard, and Truth his chief end; conditions that, in their strictness, apply only to science. It is the scientific man that should never deviate from nature, and should care for truth above every other consideration. The artist's standard is *feeling*, his end is refined pleasure; he may go to nature, but it is to select what chimes in with his feelings of artistic effect, and pass by the rest. He is not bound to adhere to nature even in her choicest displays; his own taste being the touchstone, he alters the originals at his will. The student of science, on the other hand, must embrace every fact with open arms. If a nauseous fungus or loathsome rat meet the eye of a naturalist, he is bound to record it as faithfully and minutely as he would dilate on the violet or the nightingale. When a painter adopts the human figure as a basis for setting forth harmonies of color, beauties, and form, and picturesqueness of grouping, he ought not to jar our sense of consistency by a wide departure from the usual proportions of humanity. Still, we do not look for anatomical exactness; we know that the studies of an artist do not imply the knowledge of a professor of anatomy; but we expect the main features of the reality to be adhered to. In like manner, a poet is not great because he exhibits human nature with literal fidelity; to do that makes the reputation of a historian or mental philosopher. The poet works by his metres, his cadences, his touching similes, his graceful narrative, and his exaltation of reality into the region of ideality; and if in all this he avoids serious mistakes and gross exaggerations, he succeeds in his real vocation.

The attempt to reconcile the artistic with the true—art with nature—has given birth to a peculiar school, in whose productions a restraint is put upon the flights of pure imagination, and which claims the merit of informing the mind as to the realities of the world, while gratifying the various emotions of taste. Instead of the tales of Fairyland, the Arabian Nights, and the Romances of Chivalry, we have the modern novelist, with his pictures of living men and manners. In painting, we have natural scenery, buildings, men, and animals represented with scrupulous exactness. The sculptor and the painter exercise the vocation of producing portraits that shall hand down to future ages the precise lineaments of the men and women of their generation; hence, the study of nature has become an element in artistic education; and the artist often speaks as if the exhibition of truth were his leading purpose. It is probably this endeavor to subject the imagination more strictly to the conditions of truth and reality, that has caused the singular inversion whereby the definition of science is made the definition of art.

But while fidelity, in the imitative class of arts, is to be looked upon, in the first instance, as avoiding a stumbling-block rather than constituting a charm, there are still certain ways wherein we derive from it a sort of pleasure that may be called æsthetic. We feel drawn by fellow-feeling towards one who has attended to the same objects as ourselves, or who has seized and put into vivid prominence what we have felt, without ever having expressed. The coincidence of mind with mind is always productive of the agreeable effect of mutual sympathy, and, in some circumstances, there is an additional effect of pleasing surprise.

Thus, when an artist not merely produces in his picture those features of the original that strike every one, but includes all the minuter objects that escape the notice of the generality, we sympathize with his attention, we admire his powers of observation, and become, as it were, his pupils, in extending our study and knowledge of nature and life. We feel a pungent surprise at discovering, for the first time, what has been long before our eyes; and so the minute school of artists labor at this species of effects. Moreover, we are brought forward as judges of the execution of a distinct purpose; we have to see whether he that is bent on imitation does his work well or ill; and if our verdict is favorable, our admiration is excited accordingly. There is, too, a certain exciting effect in the reproduction of some appearance in a foreign material, as when a plain surface is made to yield the impression of solid effect, and canvas or stone imitates living humanity. Finally, the sentiment of reality and truth, as opposed to fiction or falsehood, appealing to our practical urgencies, disposes us to assign a value to every work in which truth is strongly aimed at, and to derive an additional satisfaction when fidelity of rendering is induced upon the charms peculiar to A. Thus imitation—which, properly speaking, is a mere accident attaching to Sculpture, Painting, and Poetry, and has no place in Music or Architecture—may become the center of a small group of agreeable or acceptable effects. These effects are the more prized, that we have been surfeited with the purely æsthetic ideals. We turn refreshed from the middle-age romance to the graphic novel of our own time.

Besides being a source of pleasure, art is frequently spoken of as having an elevating and refining influence on the mind and character; for which reason it is considered a proper object of public encouragement in civilized communities. This circumstance is owing to the higher nature of artistic pleasure as above described, the taste for which helps to rescue mankind from the exclusive dominion of sensual and selfish enjoyments. At the same time, we must admit that the devotion to art may be itself excessive, and have the effect of withdrawing men too much from the urgency of practical life, rendering them a prey to political despotism, as well as indifferent to moral principle. Instances are not wanting to justify this remark.

See Dugald Stewart's *Philosophical Essays*, Part II., and Bain on the *Emotions and the Will*, p. 247.

ART, HISTORY OF. The history of the origin and development, growth and decline of beautiful artistic forms, constitutes a portion of the history of civilization. As regards each particular people, the history of their efforts to conceive and express absolute perfection, or what is commonly called ideal beauty, in form and color, is, with the single exception of the history of their speculative opinions, the most reliable test of the stage of progress which they have attained. Nor is it as an indication of their command over physical nature, of the abundance of their external resources, or even of their intellectual activity alone, that the history of the art of a people is thus important. It determines their moral, and even, in a certain sense, their religious position, for the inseparable connection between the beautiful and the good is in no way more clearly manifested than in the fact, that the first inroads of demoralization and social disorder are invariably indicated by a diminution in the strength and purity of artistic forms. It has been usual to include under the term history of art merely the history of the arts of form, including architecture, but excluding, of course, poetry and music, though these latter, again, are generally included when we speak of the fine arts. See ART.

The classical nations of antiquity were not insensible to the importance of tracing the development of that rich artistical life which they had originated, and we accordingly find the germs of artistic history in Pliny, Quintilian, Pausanias, and others. In the middle ages, every trace of a general historical treatment of art disappears, though casual remarks and incidental notices on the subject of artists and the arts are abundant, particularly in such works as the *Liber Pontificalis* of Abbot Anastasius, who is commonly known as 'the Librarian,' in consequence of his having

filled that office at the Vatican in the 9th c. But a history of art, in the sense which we have here assigned to the term, made its appearance in the world for the first time on the revival of letters, in the 15th and 16th centuries; when the artistic treasures of the heathen world, which had come upon mankind as novelties, fell to be contrasted with that peculiar type which art had assumed under Christian influences during the middle ages, on the one hand (see BYZANTINE ART), and on the other with that rich harvest of fresh invention which ripened during the long lives of Leonardo da Vinci (q. v.) and Michael Angelo (q. v.), in the period of which Raphael's (q. v.) short career may be regarded as the noon-day. Whilst Vasari (q. v.) traced the great epochs of Italian art, from a biographical point of view only it is true, in his celebrated work; the students of classical literature collected such expressions of opinion on artistic subjects as the writings of the ancients contained, and Palladio, Ligorio, Vignola, and others measured ancient buildings and their constituent members. In this way a vast mass of information on artistic subjects was brought together. But though the materials which might have served for a history of art were thus supplied, it was a long time afterwards before anything like proper historical treatment arose; and the knowledge of ancient art which had been gained, was applied to their respective purposes by artists on the one hand and philologists on the other. As regarded modern art, the biographical method of Vasari was adhered to, and to this circumstance we are indebted for the innumerable artistic anecdotes which have been preserved. The remarkable variations in style which exhibited themselves between the 16th and 18th centuries, gave rise to a species of historical treatment which had for its object the discovery of the common features by which the artists of the respective periods were distinguished. But the history of style, strictly speaking, begins with Winckelmann (q. v.), who was the first to divide ancient art into epochs, and to trace its connection with the general history of human progress. It was from this period that the history of art came to be regarded as a branch of the history of civilization. Even where the biographical method continued to be followed, it was henceforth with this difference that the division into schools took the place of mere chronological arrangement.

The strongly classical tendency which exhibited itself towards the end of last century, and the romantic reaction and consequent admiration for the middle age which succeeded, though both must be regarded as one-sided influences, had an unquestionable effect in calling attention to what was really great in the artistic productions of these respective periods; and during the present century, the history of art has gradually assumed a more important place as a department of general history. It was only in very recent times, however, that a complete artistic history appeared in Kugler's *Handbook of the History of Art*, which has been partially translated into English, and edited by Sir Charles Eastlake. In the original work, which is very excellent, the immense mass of material which the subject offered has been arranged in periods, and treated in such a manner as to present a sketch which is complete in itself, whilst at the same time its connection with and dependence on general history, social, political, and philosophical, are carefully indicated throughout. Alongside of Kugler's history, that of Schnaase falls to be mentioned—a work giving a philosophical and historical account of the origin of the various styles, and their connection with each other; as also the works of Lübke, Springer, and Carriere. Kinkel's history of Christian art has unhappily remained incomplete. Waagen's works on art and artists in England, France, and the other countries by which Germany is surrounded, are the best artistic hand-books for the traveler. Those which have reference to England have been translated. There are many other historical works of importance on special departments and separate schools of art, monographs and the like, but, with the exception of Stirling's *Annals of the Artists of Spain*, and *Velusquez and his Works*, very few belong to our own literature.

ART EXHIBITIONS. Public displays of the works of living artists, with the view of affording gratification and instruction to the community on the one hand, and on the other, of procuring purchasers for the works exhibited, have taken place in most of the principal towns of Europe, for more than a century and a half. Though sometimes connected with Art Unions (q. v.), A. E. are in reality much older institutions. Still, as the offspring of a necessity which did not exist in earlier times, they are essentially modern. So long as artists were chiefly patronized either by the church, by their respective governments, or by individuals of sovereign rank, their works were placed either in churches, in public buildings, or in palaces, and were thus continually exhibited to the public; but when private patronage came to be their chief support, and their works, if sold at all, were certain to be buried in private houses, the necessity for making arrangements by which they could be displayed to the public either before they were disposed of, or afterwards with the consent of their owners, became apparent. We have mentioned under Art Unions that, till aided by these latter institutions, A. E. for the most part did not succeed in effecting the objects which their promoters had in view.

The earliest collective art exhibition was probably that of the members of the Academy of the Fine Arts at Rome; anything of the kind which had previously existed being confined to the works of a particular artist and his pupils, enriched perhaps by a few contributions from his friends. Something of this earlier character probably attached to these Roman exhibitions; and the first art exhibition, in the sense in which we now understand it, seems to have been that of the French Academy in 1673. From 1745, down to the period of the Revolution, this exhibition, which from its commencement had been confined to the works of members of the Academy, took place biennially. During the Revolution it was thrown open to foreign artists, and in 1796 it was again made annual. An exhibition was attempted in England in 1760, but it was not till 1769 that the regular exhibitions of the Royal Academy commenced. They have since gone on, not only without interruption, but with increasing energy. The works exhibited in 1760 were only 130, the number of exhibitors being 69; in that of 1880 there were exhibited 1650 works by about 850 artists. The annual revenue which the Academy derives from the fee of one shilling paid by each visitor has also been steadily increasing. The exhibition of the Scottish Academy, which is the second in importance in this country, has existed since 1826. To the first exhibition, 178 works were sent by 27 contributors; the exhibition of 1880 consisted of 1120 works, which were contributed by 502 artists. The annual revenue of the Scottish Academy derived from this source exceeds £2500. The only other exhibition of the same class in the United Kingdom is that of Dublin, which is supported by an annual grant from government—the exhibitions of London and Edinburgh being merely furnished with rooms erected at government expense. Several private societies in London and the provinces, however, have exhibitions for similar objects, and conducted on similar principles. Of these we may mention the British Institution, the Society of British Artists, the National Institution, the Society of Painters in Water-colors, and its rival, the New Society of Painters in Water-colors. There are also exhibitions in several of the large provincial towns, such as Manchester, Liverpool, Glasgow, &c. On the continent, wherever an academy of art exists, there is now an exhibition, which takes place for the most part annually, but sometimes biennially. In New York there is a permanent exhibition of the works of Düsseldorf artists; and from thence they are frequently carried for exhibition to the provincial towns of the Union.

The London Exhibition of 1851, commonly known as the *Great Exhibition*, was not only on a larger scale, but introduced new features into these displays. Though confined to industrial objects and works of plastic art, it gave an impulse to A. E. strictly so called, which showed itself almost simultaneously in the great international artistic exhibition of Brussels; and even those exhibitions which have been formed more closely on its model—those of Dublin and New York in 1853, London in 1862, Paris 1867, Vienna 1873, Philadelphia 1876, and Paris 1878—have all included the fine arts.

ART UNIONS. These institutions, which have for their object the promotion of a livelier interest in, and more liberal patronage of, the fine arts on the part of the general public, have gone far in modern times to supply the place of that encouragement which, at an earlier period, they received from princes and prelates.

The origin of A. U., though claimed by the Germans, seems really to belong to the French, and to be traceable to the stirring days of the first Napoleon. From France they passed over into Belgium, where they at once took root, and established themselves even in the less important towns, ten years before they were introduced into Germany. The Art Union of Malines dates from 1812, which is eleven years anterior to that of Munich. But it was in Germany that the importance of the results which A. U. were capable of producing first became apparent, and it was from Germany that they were carried into England. The Art Union (*Kunstverein*) of Munich was established in 1823, and became the model of most of those which afterwards arose. The example of Munich was speedily followed (at the suggestion, we believe, of no less distinguished a personage than Alexander von Humboldt) by Berlin, and shortly thereafter by Dresden, Leipsic, Breslau, Halberstadt, &c.; and in less than ten years there were few of the larger towns of Germany in which A. U. were not to be found. But the most important of all the A. U. of Germany is that which was established at Düsseldorf in 1829, for the Rhine provinces and Westphalia. The Düsseldorf Association has aimed at higher objects than A. U. have usually had in view, either in Germany or in England, and has been instrumental in promoting the execution of monumental works of art of the highest class. In the space of twenty years from its institution (1849), it had expended on works of art what in Germany was regarded as the enormous sum of 268,000 thalers, equivalent to about £40,200 sterling; and had been

the means of placing 24 altar-pieces in churches, eleven paintings on a large scale in public buildings, of which the frescoes in the council chambers at Elberfeld and at Aix-la-Chapelle may be mentioned as examples. The Association of Düsseldorf also publishes an artistic periodical (*Correspondenzblatt*). Other associations have imitated, not without success, the Association of Düsseldorf in directing their attention to the promotion of great works. The Bohemian Association at Prague has been peculiarly meritorious in this respect; and those of Berlin and of Cologne deserve the highest commendation for the zeal with which the first promoted the erection of Kiss's magnificent group of the Amazon on the steps of the Museum at Berlin, and the second urged on the completion of what already, in its still unfinished condition, is one of the greatest architectural monuments of Northern Europe—the cathedral of Cologne. The establishment of permanent galleries of art in the cities to which they respectively belong, is also regarded in Germany as one of the higher objects of A. U.; and in this they have been recently followed in this country, as, for example, in Edinburgh. In Munich there is already a very noble collection of modern works of art, which have been brought together in this manner; and another of the same description is in course of formation in Berlin. Association galleries also exist in Dresden, Leipsic, Breslau, Stettin, &c. Groups of associations have also been formed in Germany for the promotion and encouragement of extensive works. The western group, or cycle, as it is called, includes Hanover, Halberstadt, Magdeburg, Halle, Gotha, Brunswick, and Cassel; the eastern, Danzig, Königsberg, Stettin, &c. This arrangement, by which the influence of these associations on the highest class of art must be vastly augmented, seems worthy of imitation in this country.

Scotland, as is not unusual where the suggestion comes from a continental source, preceded England in the establishment of A. U.; the first that was formed in Britain being that of Edinburgh in 1834. The cause of its introduction was not so much the hope of bettering the condition, as to the necessity of preventing the utter extinction of everything beyond mere imitative art. Portrait-painting continued to furnish the means of living to those who practised it with success; and those who represented familiar occupations or popular customs, obtained a more limited encouragement; but it was found that precisely as the artist rose in the scale of artistic endeavor, and tended in the direction of ideal art, the sympathy and interest of his countrymen, and consequently his own remuneration, declined. The Royal Academy of London, and the academies which had been formed after the same model in Edinburgh and in Dublin, notwithstanding the annual exhibitions which they had instituted, had entirely failed to remove this evil. Private purchasers were not to be found; and in Edinburgh it was calculated that never more than £300, and sometimes as little as £35, were expended in the purchase of pictures exhibited by the Academy, and even these insignificant sums were usually paid for pictures of the very lowest class. Elsewhere, matters were even worse. Mr. Cash, a witness examined before the select committee of the House of Commons on A. U. in 1845, stated that previous to the establishment of the art union in Dublin; 'in four years, during the exhibition of the works of the Royal Hibernian Academy, 30*s.* only were expended on the patronage of art. 'Thirty shillings annually?' asked the chairman. 'No,' replied the witness; 'thirty shillings was the entire sum expended in the four years.' The success of the Scottish Association was immediate; and to its founders the public are in no small degree indebted for the rapid progress which art has made in this country during the last twenty years. 'A large annual fund,' says the secretary, in his statement to the above-mentioned committee, 'exclusively devoted to the purchase of paintings and sculpture, and to the dissemination of engravings, was speedily realized, which in the course of nine years amounted to not less than £36,900. During the same period, 771 paintings, 40 pieces of sculpture, and about 30,000 impressions from engraved plates, were distributed among the members of the Association.' Since this period, the annual funds of the Edinburgh Association have continued steadily to increase; and its promoters, as the results of their disinterested labors, have had the satisfaction to see a school of art spring up around them which is probably second to those of Munich and Düsseldorf alone. Our limits preclude us from entering into the history of the other societies in Britain which have been formed after the model of the parent institution of Edinburgh; but some conception of the success which has attended them may be gathered from the fact, that in 1856 it was calculated that they had expended not less than the enormous some of a million sterling on the encouragement of art. In addition to this direct expenditure, what is a very remarkable, and was to most persons probably an unexpected result, was that the patronage of private individuals, in place of diminishing, greatly increased, both in Edinburgh and London, during the period in question. Before concluding our sketch of the rise of these very remarkable institutions, it is proper to mention the art union of New York, established in 1838, which now supports two galleries with works of art in that city, and the members of which have had the wisdom to establish an intimate relation and lively interchange of works between their own institution and that of Düsseldorf.

As regards the constitution of A. U., the following arrangements may be stated to be common to them all. Each member, in return for an annual contribution (in Britain, usually a guinea), receives an acknowledgment, which acts as his ticket in the lottery by which the works of art, purchased with the sum thus contributed, are distributed amongst the members. Generally, a fixed proportion of the contributions is retained and devoted to the preparation of an engraving, which is presented to those who have drawn blanks in the lottery. The engraving is usually executed by a local engraver, after a work of the local school intended to be patronized. The association further makes provision for an exhibition, either permanent, as at Munich, or annual, as in London and Edinburgh, consisting mainly of the works of local artists, though most associations now admit those of strangers. A diversity of practice has existed as to the mode of distributing the funds of the unions, and much controversy has taken place between their respective partisans. The first, common on the continent, and adopted in Edinburgh, consists in putting the whole sum collected for each year into the hands of a committee of gentlemen, who are chosen for their supposed æsthetic acquirements and impartiality, and requesting them to select the pictures and other works of art afterwards to be distributed to the subscribers by lot; the second is the London plan of distributing the money itself by lot, and then permitting, or rather compelling, the prize-holders to expend it on the pictures exhibited, the selection of the pictures, however, being left to their own taste and judgment. If the object of these institutions be to cultivate an artistic taste *higher* than that which exists in the general community for the time being, the advantages of the first over the second of these modes of distribution seem scarcely to admit of question. The subject was eagerly canvassed before the select committee, and their report was that the constitution of the Edinburgh Association was preferable to that of the London Union. The principle of the A. U., under some modifications, has been extended to the patronage of art manufactures. The difficulty in distinguishing between the lottery as part of the Art Union and lotteries of an unquestionably illegal kind led in 1846 to the passing a special act for legalizing *bonâ-fide* A. U. maintained solely for the encouragement of art. See EXHIBITIONS.

A'RTA, or NARDA, the ancient *Ambracia*, is a town in Epirus, ceded by Turkey to Greece in 1881. It is situated on the western line of the new frontier, about seven miles from the gulf to which it gives name, and thirty-nine miles south from Janina. It stands on the left of the river Arta, the ancient *Aracthus*, whence the modern name. It is the see of a Greek bishop. Pop. 8000. It has a considerable trade, and manufactures, chiefly of cloths and leather; but suffers greatly from malaria. The town has never recovered from the disasters of 1828, when it was stormed by the Greek patriots under Marco Botzaris. Portions of the old walls, and the foundations of the Acropolis, are the only relics of Hellenic times. Remains of the lower empire exist in a convent founded 845 A.D. by the Empress Theodosia.

The ancient city of Ambracia, founded by a Corinthian colony about 635 B.C., was at one time a flourishing independent state, with a considerable territory. It was ruined by the Amphilochians, and became subject to Philip of Macedon. Pyrrhus made it the capital of Epirus; afterwards it fell into the hands of the Ætolians, and then of the Romans.

A'RTA, GULF OF, an arm of the Ionian Sea, 25 miles long and 10 wide, between Greece and Turkey. Until 1881 the whole of the northern coast was Turkish; but in that year the portion east of the river Arta was ceded to Greece. It was arranged that the gulf should be neutral, the fortress commanding the entrance to the gulf on either side being disarmed. Under its ancient name of the Ambraciot Gulf, it separated Epirus and Acarnania.

ARTABA'ZUS, the name of several distinguished Persians in the times of the Achæmenidæ. When Xerxes advanced against Greece, A. led the Parthians and Chorasmi. At a later period he warned Mardonius, but in vain, against engaging in battle at Platæa; and on the first indications of defeat, he withdrew his own division, amounting to 40,000 men, from the field, and succeeded, though with great difficulty, in forcing his way through the wilds of Thessaly, Macedonia, and Thrace to Byzantium, where he crossed to Asia. Subsequently, he acted as negotiator between the Spartan Pausanias and Xerxes.—Another A. was general under the Persian king, Artaxerxes Mnemon, and revolted against Artaxerxes Ochus in 356 B.C. For this offence he appears to have been forgiven; and subsequently we find him accompanying King Darius after the battle of Arbela. Alexander rewarded his fidelity by appointing him satrap of Bactria.

ARTANTHE. See MATICO.

ARTAXE'RXES, the name of several Persian kings. A. I., surnamed *Longimanus*, the second son of Xerxes, escaped from the

conspiracy of Artaban and others, and ascended the throne in 465 B.C. His long reign, extending to 425, was marked by a decline of power.—A. II., surnamed *Mnemon*, succeeded his father, Darius II., in 405 B.C. After gaining the victory over his brother Cyrus, he became involved in war with Sparta, which ended with the Antalcidean Treaty of Peace. He died in 361.—A. III., surnamed *Ochus*, was the son and successor of the former, and reigned in the true style of oriental despotism until 338 B.C. One of his most daring exploits took place in Egypt, where he caused the divine bull Apis to be slaughtered and cooked as ordinary beef. A. III. was poisoned in 338 by his eunuch Bagoas. It is said that his flesh was eaten by cats, and that hilts for scimitars were made of his bones.—The founder of the new Persian dynasty of the Sassanidæ (which ruled from A.D. 226 to 651, was named A.

ARTEDI, Peter, a celebrated naturalist, was born on the 22d of February 1705, at Anund, in the province of Angermannland, Sweden. He was at first designed for the church, and entered the university of Upsala, intending to pursue the usual course of philosophy and theology; but he soon abandoned all thought of the ministry, and betook himself to medicine. In 1728, Linnæus went to Upsala, to study the same science, and a close intimacy sprung up between the young men. They worked together, and to a certain extent, on the principle of a division of labor. Physiology, chemistry, and mineralogy they pursued in common; but to this A. added ichthyology, and Linnæus ornithology and entomology. In 1734, A. sailed for England, and Linnæus went to Lapland, each having made the other his heir and executor of all his scientific documents. While in London, A. wrote the preface to his *Ichthyologia*. Next year he went to Leyden in Holland, where he found Linnæus just arrived from the north. Each showed the other the results of his labors. A.'s useful career was abruptly ended, on the 21st of September 1735, by his falling into one of the canals near Amsterdam.

A.'s only complete work is the *Philosophia Ichthyologica*. The *Synonymologica* is described as a work of extraordinary labor, but somewhat confused. Linnæus faithfully performed his duty as his friend's executor. He arranged, corrected, and completed his manuscripts, and published the whole, together with a life of the author, in 1738. According to Cuvier, the great work of A. is the first named, which gave a truly scientific character to the study of fishes. The only error of any magnitude which occurs in it is including the Cetaceæ among fishes. A. was also a distinguished botanist. He was the first to indicate, as a special characteristic, the presence or absence of involucra in the umbelliferous plants, whose species are so difficult to distinguish from each other. Linnæus has called a genus of these, in memory of his friend, *Artedia*.

ARTEMI'SIA, a genus of plants of the natural order *Compositæ*, sub-order *Corymbiferæ*, in which the flowers of the disk are hermaphrodite, those of the ray in one row, the bracts forming a roundish imbricated head, the receptacle naked or hairy, the achœnia obovate, and destitute of pappus. The heads of flowers are numerous and small; the leaves generally much divided. There are many species, herbaceous plants and shrubs, natives chiefly of the more temperate regions of the eastern hemisphere. They have generally an aromatic smell, more or less agreeable, and a warm, sometimes rather acrid and bitterish taste. —To this genus belongs Wormwood (*A. Absinthium*), the *Apsinthion* of the ancient Greeks, to whom its medicinal properties were well known. It is a native of Britain, the continent of Europe, and the northern parts of Asia, growing in waste places, by waysides, &c. It is a perennial, 2—4 feet high; its leaves bipinnatifid and clothed with a silky down, and its small hemispherical drooping heads of flowers are of a dingy yellow color, and are produced in axillary panicles. It is aromatic and bitter, containing a bitter principle and an essential oil, both of great strength, upon account of which it is used in medicine in various forms (oil, extract, tincture, &c.), as a stomachic and anthelmintic or vermifuge. It was formerly in much use as a febrifuge. It is a plant very frequently to be found in cottagers' gardens, occupying an important place in their domestic pharmacopœia. It is an essential ingredient in a number of compound medicines. Its roots, and those of some other species of this genus, have been recommended in epilepsy.—Sea Wormwood (*A. maritima*, including a variety which has been called *A. Gallica*), a native of salt-marshes in Britain and other parts of Europe, possesses similar properties, and is occasionally used for the same purpose; as also Roman Wormwood (*A. Pontica*) a native of the middle and south of Europe, but not of Britain—Tartarian Wormwood (*A. Santonica*), a native of Tartary, Persia, and other parts of the East; and Indian Wormwood (*A. Indica*), a native of the Himalaya, abounding at elevations of 2000—6000 feet.

Wormwood (*Artemisia Absinthium*).

Indian wormwood grows to the height of 12 feet. It is considered in India a powerful deobstruent and antispasmodic. Tree Wormwood (*A. arborescens*), a native of the south of Europe and the Levant, is also larger and more shrubby than the common wormwood, which, in characters and qualities, it much resembles. —The dried flower-buds of a number of species of A. are sold under the names of Wormseed and of *Semen Contra*, *Semen Cinæ*, *Semencine*, &c., and have long been in much repute as an anthelmintic. *A. Santonica*, and *A. Sieberi* (or *A. Contra*), a native of Palestine, are believed to yield much of the wormseed which is brought from the Levant, also *A. Judaica*, a native of the East and of Barbary, which is regarded as the principal source of the Barbary wormseed. The flower-buds of *A. glomerata*, *A. Lerchiana*, and *A. pauciflora*, natives of the banks of the Volga, are also said to form part of the wormseed of the shops; and those of *A. Vahliana* are collected in the north-east of Persia, and form the *Semen Cinæ Levanticum* or *Semen Cinæ in grains*. The flower-buds of *A. cærulescens*, a Mediterranean plant, which is said to have been found on the sea-coast of England, form the anthelmintic called *Semen Seriphii* or *Barbotine*. Those of *A. camphorata*, another native of the south of Europe, are used in the same way. Even those of *A. Absinthium* and *A. vulgaris* are used under the name of wormseed.—The plants from which the bitter aromatic liquor called *Extrait*, *Eau*, or *Crême d'absinthe* is prepared, are small, low-growing species of A. (*A. mutellina*, *A. glacialis*, *A. rupestris*, *A. spicata*, &c.), found on the Alps, and known to the inhabitants of the Alps by the name of *Genipi*. This liquor was first introduced as a febrifuge during the French campaign in Algeria in 1844, and was mixed by the French soldiers with their wine. They acquired a habit of drinking it diluted with water as a beverage; and its use rapidly extended, with very evil consequences. See Absinthe.—Mugwort (*A. vulgaris*), a common native of Britain and of the continent of Europe, often found about ruins and in waste places, grows to the height of 3—4 feet, with pinnatifid leaves and somewhat racemed small flowers, which have each five florets of the ray. It emits, when rubbed, an agreeable smell, and has a bitter taste. In Germany the young shoots and leaves are used in cookery for seasoning. It is used also for the same medicinal purposes as wormwood, but is weaker. Its leaves, and those of some of the other species, are used as fomentations for cleansing and healing wounds.—Southernwood (*A. Abrotanum*) is a shrubby plant with long straight stems, 3—4 feet high, the lower leaves bipinnate, upper leaves pinnate, their segments hair-like. It is a native of the south of Europe and middle parts of Asia, and has long been a favorite plant in cottage-gardens in Britain. It has an aromatic and pleasant odor. The leaves are used to drive away moths from linen; and in some parts of the continent of Europe, as an ingredient in the manufacture of beer. The smell of this plant appears to be peculiarly disagreeable to bees, which retreat from it; and a little branch of southernwood is sometimes efficaciously used when they are swarming, to promote their ascent into the new hive placed over them.—Tarragon (*A. Dracunculus*) is a perennial plant, a native of Siberia, and long cultivated in gardens in Britain. It has a branching stem 1—1½ ft. high, with narrow leaves. It is fragrant, and has an aromatic smell and taste. The leaves and tender tips are a favorite ingredient in pickles. An infusion of the plant in vinegar is used as a fish sauce.—The leaves of *A. Maderaspatana* are regarded in India as a valuable stomachic, and are also used in anodyne fomentations.—Moxa (q. v.) is prepared by the Chinese from the leaves of *A. Moxa* and other species, the whole surface of whose leaves is covered with a thick down.—*A. acetica*, a Persian species, is said to have a strong odor of vinegar.

ARTEMI'SIA, queen of Caria (352—350 B.C.), was the wife of Mausolus, and is celebrated for the magnificent mausoleum which she caused to be erected to her husband's memory. See Mausoleum.—Another A., queen of Halicarnassus, accompanied Xerxes in his expedition against Greece, and distinguished herself at the battle of Salamis (480 B.C.); she ended her life, in consequence of an unfortunate attachment, by leaping from a rock.

ARTEREO'TOMY, or the opening of an artery, is an operation that has been strongly advocated in those cases in which it is de-

sirable to produce a more decided and immediate effect upon the cerebral circulation (as in severe forms of sanguineous apoplexy) than could be produced by ordinary venesection. It is supposed by some surgeons to relieve pressure on the brain more efficiently than opening the jugular vein could do; and whether this is the case or not, it is a simpler and less dangerous operation. The only vessel operated on is either the temporal artery itself or one of its main branches. The operation is a simple one, but should, of course, only be undertaken by a surgeon. To arrest the flow of blood when sufficient has been taken, the artery should be completely divided, and after the parts have been sponged, a compress, or small pad, should be applied to the wound, and secured by a bandage, which must be carefully adjusted, so as, if possible, to remain undisturbed for four or five days, when it may be removed, and the wound covered with a strip of plaster.

A'RTERIES, Diseases of. Most of the important morbid conditions of the arteries are those which are occasioned by the deposition of *atheroma* (a Greek word signifying a tumor or deposit containing matter like *adhere*, meal or groats) on the free surface of the inner coat of the vessel; a new inner lining to the artery being thus furnished. As atheroma has the effect of weakening, enlarging, and occluding arteries, according to the extent and period of the deposition, it is expedient briefly to notice the most important stages of its progress. In the earliest stage, atheroma consists of a thin, soft, and clear membrane, lining a part of the whole of the tube. It seems to be a mere addition to the artery, in whose original coats there is no apperance of disease. It is most probable a deposit on the inner surface from the blood. On the inner surface of the new coat, a similar layer gradually forms, and in course of time, becomes the foundation of subsequent formations; and when many strata have thus been deposited, the collective mass ceases to be transparent, and becomes converted into an opaque material similar to hardened albumen, and finally to ligament. Until this consolidation occurs, the coats of the artery are not much affected; but by their adhesion to the hardened deposit, they lose their strength, elasticity, and natural color, and their functions are destroyed. The indurated deposit may now undergo one or other of these changes: it may either soften in its interior, in which case it degenerates into a pulpy mass of cholesterine, oil-globules, albuminous and chalky molecules; or it may be converted into a layer of hard, chalky, bone-like matter. This latter change (cretefaction or ossification) takes place only in the external oldest layers of thick deposits; and nothing intervenes between the bony plate and the middle coat of the artery, for the inner or lining coat partakes in the morbid change. It is obvious that either of these changes (softening or hardening) must gradually lead to disease of the arterial coats generally. The process of change is slow, and the change itself can only be detected in the living subject when it is in an advanced stage. In the radial artery and others which lie superficially, the finger can often detect rings or tubes of chalky matter. Most commonly, however, the state of the arteries is detected by some secondary symptom.

Athermatous deposit is at first attended with a narrowing of the calibre of the vessel, varying with the thickness of the deposit, and most marked at the points of bifurcation. Smaller arteries may be completely obliterated, whilst the larger arteries may be very much contracted. Thus, the common iliac has been found to have its canal diminished by about one half, and the great ascending branches of the arch of the aorta, the subclavian and carotid arteries, have been found very nearly closed. A later consequence of the same disease is dilatation of the vessel. The power of the outer coats being insufficient to compress the deposit and to close in upon the blood, by which each contraction of the left ventricle of the heart distends them, they remain wide and distended during the relaxation of the ventricle, and the artery thus slowly expands; the enlargement being most marked at parts where there is most obstruction to the blood-current, as, for example, in curved arteries. These dilatations are apt to terminate in regular aneurism. The changes which we have already described have an effect on the retractile power of the arteries. A healthy artery, if cut across, may shorten to the extent of an inch and a half, as has been actually measured by Mr. Moore ('Diseases of the Arteries,' in Holme's *System of Surgery*, vol. iii. p. 329); but the retractile power is destroyed by the deposition of bony rings or plates. But although incapable of shortening, the arteries sometimes become abnormally lengthened, and consequently become not only dilated, but also tortuous. If the outline of superficial arteries thus affected be watched, each pulsation of the heart is seen to increase their curvature; and the deep-seated arteries (as the iliac) are thus often forced from their normal positions. Another condition involving much danger is this: an ossified artery loses the smoothness which the interior of the vessel ought to present, and from the displacement or cracking of a bony plate, there may be sharp rough projections exposed, to which the fibrin of the circulating blood may adhere. These little clots becoming detached, may be carried with the blood till they become arrested, and plug up an artery, thus presenting cases of embolism or Thrombosis (q. v.). Again, the relation of this disease to accidents and surgical operations on arteries is obvious. A blow may crush a diseased artery, when a healthy elastic vessel might have escaped injury. Such a slight movement as suddenly lifting the arm to the head, for the purpose of securing the hat in a sharp gale, has been known to have been followed by aneurism of the axillary artery. A ligature applied to any ossified artery, is very apt to cause it to break, and the difficulty of securing such vessels is often very great. It is to this form of disease that most of the failures of operations for aneurism are due. Having thus noticed the most important changes which are induced in the arteries by atheroma, and the evil consequences to which they may give rise, we shall now direct attention to an important cause of occlusion—that, namely, in which the canal is closed by an imported foreign body, and especially by fibrinous plugs originally formed in the heart, and transported to other parts in the stream of the blood.

When a large artery, as, for example, the principal artery of one of the limbs, is 'suddenly plugged in its higher part, a sensation of severe pain is commonly the immediate result of the accident. In some cases, the pain extends along the course of the vessel, which, though pulseless, is extremely tender; in others, the suffering is referred to some distant part of the limb, as, for instance, to the calf. Signs of a deficient circulation succeed, and they may amount to pallor, loss of temperature, numbness of the surface, or even to that "torpor" which is observed to precede the total death of a limb in certain cases of injuries of vessels. Such torpor implies not only a loss of circulating blood, but also a cessation of all feeling and motor power in the limb.'—Moore, *op. cit.*, p. 335. Although Gangrene (q. v.) is always to be feared as the result of an obstructed artery of large size, it does not invariably follow; as a collateral circulation may be established, and the life of the limb may be thus saved. Very young persons will endure the obliteration of very large vessels without gangrene; and a case is on record (*Med. Chir. Trans.*, vol. xxix. p. 214) in which 'all the main arteries of both upper extremities and of the left side of the neck were reduced to solid cords,' and yet no gangrene ensued. From the description of the symptoms, the nature of a case of sudden occlusion of a large artery by a plug may possibly be recognized, or, at all events, suspected even by a non-professional observer. Medical aid must at once be sought. The early indications of treatment are to preserve the temperature of the part, to favor the establishment of a collateral circulation, to protect the limb from irritation or injury, to give nourishing blood-making food, and to relieve pain by the judicious use of opiates. The later treatment, if the affection is not checked, is that which is described in the article Gangrene.—*Arteritis*, or *Inflammation of the Arteries*, was a disease which was formerly recognized by physicians. No such specific general disease is now believed in; but the changes which have been already described as occurring in consolidated atheromatous deposits—either softening or ossification—are accompanied by an unnaturally vascular condition of the attenuated arterial walls, extending to true local inflammation, and even to suppuration.—*Aneurism* (a tumor containing blood, and communicating with the cavity of an artery) has been considered in a special article.

A'RTERY (Greek *arteria*), named from the old idea that these tubes were air-carriers. Arteries are the vessels through which the blood passes from the left side of the heart to the tissues. The structure of an arterial tube is very complex, and a section of it may be roughly subdivided into three layers, called the coats of the artery: an external, which is elastic and distensible; a middle, which is muscular, contractile, and brittle; an internal, also brittle, smooth and transparent, being lined with epithelium on the side washed by the blood. The tube is also enveloped in cellular tissue, termed the *sheath* of the A. When an A. is wounded by a sharp instrument, the effect varies with the direction of the cut. Thus, if longitudinal, the edges may not separate, and the wound may heal without much bleeding; if oblique or transverse, the edges gape, and a nearly circular orifice allows of a profuse hemorrhage. If the A. be completely divided, its walls do not collapse like those of a vein, but pass through certain changes provided by nature to prevent fatal bleeding. The cut orifice contracts, and also retracts into its cellular sheath; this checks the flow of blood, a clot of which shortly forms on the outer side; then another forms inside the vessel; and together, they stem the flow, till the cut edges of the A. have time to throw out lymph (see Adhesion), and heal as wounds of other tissues. When an A. is compressed by a ligature.

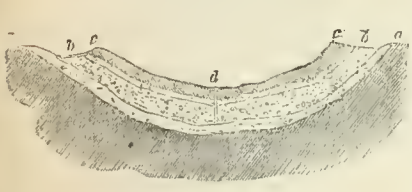
5. Fibrous, } external.
6. Areolar, }

the brittle inner and middle coats crack, curl inwards, and heal. See BLEEDING.

The arteries of the human body are all offsets, more or less direct, of the aorta. As each main trunk passes into a portion of the body, it divides into two principal divisions: one, which breaks up into branches for the supply of the tissues in the vicinity—the A. of *supply;* and another, which passes almost branchless to supply the parts beyond—the A. of *transmission.* These, however, anastomose (q. v.) freely, so that the distant tissues are not solely dependent for their supply on only one arterial trunk. Thus, the femoral A. divides in the groin into the profunda, or *deep* femoral, to supply the thigh, and the *superficial* femoral, to supply the leg below the knee. Again, the common carotid divides into *external* carotid, to supply the neck and head, and the *internal* carotid, to supply the brain. Although arteries have generally the same distribution or arrangement of branches, they occasionally vary, and thereby are apt to puzzle a superficial anatomist. Mr. Thomas Nunn of London, an excellent human anatomist, has clearly shown that these anomalies in arterial distribution are all governed by the law of arterial distribution just mentioned, a fact which not only simplifies the study of arterial anatomy, but assists the operative surgeon out of perplexing positions. The principal arteries will be considered under their distinctive names. The best authority on arteries is the splendid work of R. Quain. See ARTERIES, DISEASES OF.

ARTE'SIAN WELLS are perpendicular borings into the ground, through which water rises, from various depths, according to circumstances, above the surface of the soil. The possibility of obtaining water in this way in a particular district depends on its geological structure. All rocks contain more or less water. Arenaceous rocks receive water mechanically, and according to their compactness and purity, part with a larger or smaller proportion of it. A cubic yard of pure sea-sand can contain, in addition to the quantity of dry sand which occupies that space, about one-third of its bulk of water. It would part with nearly the whole of this into a well sunk in it, and regularly pumped from. Chalk and other rocks, composed of fine particles, closely compacted together, contain as large a proportion of water; but from the power of capillary attraction, little or none of this water would be drained into a well sunk in such rock. From the existence, however, of numerous crevices in chalk through which the water freely flows, and from the general presence of a larger quantity of water than the porous rock is able to retain, wells sunk in chalk often yield water. There is yet a third class of rocks, which are perfectly impervious to water: such are clays, which are absolutely retentive, neither allowing water to be obtained from them nor to pass through them. When such rocks occur in basins (q. v.) in alternating layers, and in such order that pervious beds are inserted between impervious ones, it is evident that if a perforation is made through the retentive barrier-bed in the lower portion of the basin, the water contained in the water-logged strata will rise through the bore to a height depending upon the pressure of water which has accumulated in the confined sloping space between the two impervious beds.

The explanation will be more evident by a reference to the accompanying figure, which may be considered as a diagrammatic section of the London basin. There is here a number of porous beds, *b, b,* composing the cretaceous measures, resting on the impervious gault, *a a,* and these, again, are covered by the equally impervious series of the London clay, *c c,* which form the strata on the surface, and extend to a considerable depth. The edges of the chalk-beds are largely exposed in the higher grounds around London; the water falling on the whole area of these exposed edges, sinks into the more or less porous cretaceous beds, and would, in course of time, by continued accessions, fill up the basin, were it not prevented by the clay above. By driving a bore, *d,* through this superior bed, the inferior water-logged strata are reached, and the subterranean water rises to the surface, and flows continuously, by means of hydrostatic pressure.



Section of the London Basin.

Many such wells exist in London and its vicinity; those which form the ornamental fountains in Trafalgar Square descend into the upper chalk to a depth of 393 feet. The most famous artesian well perhaps is that of Grenelle, in the outskirts of Paris, where the water is brought from the gault at a depth of 1798 feet. It yields 516½ gallons of water in a minute, propelled 32 feet above the surface; temperature, 81°·7 F. An artesian well in course of construction at Pesth, yielded, at a depth of 3100 ft., 175,000 galls. of water per day, of a temperature of 161° F., projected 35 ft. above the surface. It is to be sunk till the water reach 178° F.

It is believed that the Chinese have been long acquainted with artesian wells. They have been in use for centuries in Austria, especially in the neighborhood of Vienna, where they are very abundant. No knowledge existed as to their source, and consequently the boring for them was engaged in and conducted in a rude and empirical manner. An excavation was made till a bed of clay was reached; on this a perforated mill-stone was laid, and through the hole the clay was bored until water rose. As soon as geology took the position of a science, and the theory of A. W. was propounded, the engineer was able, after the geological survey of a district, to discover whether a supply of water could there be obtained in this way. Already, districts formerly dry and arid have received a plentiful supply of water by means of such wells, and many more applications have yet to be made. (Tchihatchef, at the British Association in 1882, affirmed that A. W. were made in old Greek times in the Sahara, at Baalbek, &c.; and that crabs are found at the bottom of recent ones.) Artesian borings have been executed in the Sahara of the province of Constantine with remarkable success. The first attempt, after a few weeks' labor, produced a constant stream, forming a perfect river, and yielding 4010 quarts of water per minute, at a temperature of 78° F. In 1880, there were above 150 such borings in the province. The result is proving beneficial not only to the country materially, but also to the character and habits of its nomadic Arab inhabitants. Several tribes have already settled down around these wells, and forming thus the centers of settlements, have constructed villages, planted date-palms, and entirely renounced their previous wandering existence.

A. W. have supplied a portion of the data upon which the internal temperature of the earth has been calculated. They have their origin below that zone which is affected by the changing superficial temperature of the seasons, and consequently the water is of a constant temperature. Thus the Grenelle artesian well has a temperature of 81°·7 F., while the mean temperature of the air in the cellar of the Paris Observatory is only 53°. MM. Arago and Walferdin observed the temperature as the work proceeded, and found that there was a gradual and regular increase downwards. The latter gentleman made a series of very accurate and careful observations on the temperature of two borings at Creuzot, within a mile of each other, commencing at a height of 1030 feet above the sea, and going down to a depth, the one of 2678 feet, the other about 1900 feet. The results, after every possible caution had been taken to insure correctness, gave a rise of 1° F. for every 55 feet down to a depth of 1800 feet, beyond which the rise was more rapid, being 1° for every 44 feet of descent. There are several very deep borings in the United States.

ARTEVELDE, JACOB, a brewer of Ghent, celebrated as a popular leader in the 14th c. In the war between England and France, he gave his aid to the former, while the counts of Flanders supported the latter. A., after gaining great advantages over the party of the nobles, went too far when he proposed that the son of Edward III. of England should be elected Count of Flanders. For this the Flemings were not prepared, and, in consequence, A. was killed in a popular insurrection, August 19, 1345. His son Philip, in 1381, was leader of the people of Ghent in their civil war against Bruges, and gained a victory over Count Louis. The latter was afterwards assisted by Charles VI. of France, and Philip was defeated and slain at Rosbeke, 1382.

ARTHRITIS, inflammation of the joints. See JOINTS, RHEUMATISM, GOUT.

ARTHROPODA. See ARTICULATA.

A'RTHUR, king of a tribe of ancient Britons, is supposed to have flourished in the 6th century. He is usually represented as a Christian prince who struggles bravely to maintain the liberty and faith of his country against the pagan Saxons, but there is no evidence for the statement that he fought against the Saxon Cerdic. Neither the Welsh bards nor Nennius assert this; in fact, it would seem to be merely an inference drawn from the supposition that the scene of A.'s exploits was the west and south-west of England. But Mr. Skene (*The Four Ancient Books of Wales,* vol. i., pp. 50—60) seeks to prove from an examination of Nennius (*Historia Britonum,* cap. 50), that the localities of the twelve great battles which A. fought are in Strathclyde, and therefore that he belongs to the region now called Scotland rather than to England. If there is any reality in his history at all, this is probably the correct view of it, but the influence of Geoffrey of Monmouth's fictions, and of the French romances, succeeded in fixing the Cumbrian prince in the more important part of the island. It is a curious fact that no mention whatever is made of A. by the venerable Bede, the oldest of our historians, or by the annalists of the *Saxon Chronicle;* and Mr. Skene's explanation, that these authorities only 'record the struggle between the Britons and the Saxons south of the Humber,' is hardly satisfactory.

In the lays of the Welsh bards, supposed to be as early as the 6th and 7th centuries (although no manuscript is extant of older date than the 12th c.), A. and his brave companions are celebrated,

but modestly and without miracle. It is in Nennius that the legendary additions begin to develop themselves, though Mr. Skene does 'not hesitate to receive the Arthur of Nennius as the historic Arthur.' Then follow at a distance of three or four centuries the so-called Armoric collections of Walter, archdeacon of Oxford, from whom Geoffrey of Monmouth (q. v.) professes to translate, and in which the marvelous and supernatural elements largely prevail.

Here for the first time the magician Merlin comes into association with A. According to Geoffrey, A.'s father, Uther, conceiving a passion for Igerna, wife of Gorlois, Duke of Cornwall, is changed by Merlin into the likeness of Gorlois, and A. was the result. After his father's death, A. becomes paramount leader of the British, and makes victorious expeditions to Scotland, Ireland, Denmark, Norway, and even to France, where he defeats a great Roman army. During his absence, his nephew, Modred, revolts, and seduces Prince A.'s wife, Guanhumara. A. returning, falls in a battle with his nephew, and is carried to the Isle of Avallon to be cured of his wounds. Geoffrey's work apparently gave birth to a multitude of fictions which came to be considered as quasi-historical traditions. From these, exaggerated by each succeeding age, and recast by each narrator, sprung the famous metrical romances of the 12th and 13th centuries, first in French and afterwards in English, from which modern notions of A. are derived. In these his habitual residence is at Caerleon, on the Usk, in Wales, where, with his beautiful wife Guinevere, he lives in splendid state, surrounded by hundreds of knights and beautiful ladies, who serve as patterns of valor, breeding, and grace to all the world. Twelve knights, the bravest of the throng form the center of this retinue, and sit with the king at a round table, the 'Knights of the Round Table.' From the court of King A., knights go forth to all countries in search of adventures—to protect women, chastise oppressors, liberate the enchanted, enchain giants and malicious dwarfs, is their knightly mission. A Welsh collection of stories called the *Mabinogion*, of the 14th and 15th centuries, and translated into English by Lady Charlotte Guest in 1849, gives an idea of the Arthurian legends. Some of the stories 'have the character of chivalric romances,' and are therefore probably of French origin; while others 'bear the impress of a far higher antiquity, both as regards the manners they depict, and the style of language in which they are composed.' These latter rarely mention A., but the former belong, as Mr. Skene puts it, to the 'full-blown Arthurian romance.' Early in the 12th c., the Arthurian metrical romance became known in Germany, and there assumed a more animated and artistic form in the *Parzival* of Wolfram of Eschenbach, *Tristan and Isolt* of Gottfried of Strasburg, *Erec* and *Iwein* of Hartmann, and *Wigalois* of Wirnt. The most renowned of the heroes of the Arthurian school are Peredur (Parzival or Perceval), Tristan or Tristram, Iwein, Erec, Gawein, Wigalois, Wigamur, Gauriel, and Lancelot. From France, the Arthurian romance spread also to Spain, Provence, Italy, and the Netherlands, and was again retransplanted into England. One of the publications that issued from the press of Caxton (1485), was a collection of stories by Sir Thomas Malory, either compiled by him in English, from various of the later French prose romances, or translated directly from an already existing French compendium. Copland reprinted the work in 1557, and in 1634 the last of the black-letter editions appeared.

A reprint of Caxton's *Kynge Arthur*, with an introduction and notes, by Robert Southey, was issued in 1817 (*The Byrth, Lyfe, and Actes of Kyng Arthur*, &c., 2 vols. 4to). The best edition is that by Thomas Wright (Lond. 3 vols., 1866) from the text of 1634. The name of King A. was given during the middle ages to many places and monuments supposed to have been in some way associated with his exploits, such as 'Arthur's Seat' near Edinburgh, 'Arthur's Oven' on the Carron near Falkirk, &c. What was called the sepulchre of his queen was shown at Meigle, in Strathmore, in the 16th c. The interest of the legends about King A. and his knights has been revived by Tennyson's *Idylls of the King* (1859 *et seq.*); and some of Wagner's operas. See Turner's *History of the Anglo-Saxons;* Ritson's *King Arthur;* Villemarqué, *Contes Populaires des Anciens Bretons* (1842); Grässe, *Sagenkreise des Mittelalters* (1842); Skene's *Four Ancient Books of Wales* (1868); Glennie's *Arthurian Localities* (1869); Cox's *Popular Romances of the Middle Ages* (1871); Fontan, *Arthus, ou le Roi-chasseur* (1874).

ARTHUR, prince of Brittany. See King JOHN.

ARTHUR, CHESTER ALLAN, twenty-first president of the United States, was born in Franklin County, Vermont, on the 5th October 1830. He distinguished himself as a student at Union College, New York; and devoting himself to law studies, was admitted to the bar at an early age. After having practised for some years, he was made a Judge-advocate; at the outbreak of the great civil war he held the post of Inspector-general; and during the war was Quartermaster-general for the New York forces. He subsequently returned to law practice, and became the head of a very eminent law firm. A., who is of Scoto-Irish extraction, took a prominent share in politics, on the Republican side; and in 1871 President Grant appointed him Collector of Customs at the port of New York. As being hostile to the reform in the civil service aimed at by President Hayes, he was removed from this post in 1878, and again returned to the practice of law. He was a leader of the Republican party in the State; and though belonging to the section of the Republicans opposed on the question of civil service reform to that represented by General Garfield, was made Vice-president of the United States when Garfield became President in 1881. The death of Garfield, caused by the effects of an assassin's pistol-shot, called the Vice-president to the supreme magistracy of the union; and A. was installed as president on the 22d September 1881. See ARTHUR, CHESTER A., in AM. SUPP.

ARTHUR'S SEAT, a hill in the immediate vicinity of Edinburgh, which rises to the height of 822 feet above the level of the sea. The ascent is easy, and the prospect from the top unrivalled. A. S. is supposed to derive its name from the British king. When the hill received this appellation is not known; but at the close of the 15th c., the poet Kennedy mentions 'Arthur Sate or ony hicher hill.'

The hill is formed of a mass of trap of various species, upheaved through the carboniferous strata of Central Scotland, and presenting on the west and south sides, at the height of 570 feet, a perpendicular range of precipices, called Salisbury Crags, 60 to 80 feet high. The trap is in tabular masses, and has elevated and hardened the carboniferous sandstone, shale, and limestone beds, which dip east, and crop out on the west, besides being broken through and overflowed by the trap-rocks. In the center of the hill, the trap often encloses fragments of sandstone, and divides it by veins. The central and upper part of the hill, and the remarkable columns called 'Samson's Ribs,' consist of basalt.

A'RTICHOKE (*Cynara Scolymus*), a thistle-like perennial plant, now growing wild in the south of Europe, but probably a native of Asia. The genus *Cynara* belongs to the natural order *Compositæ*, sub-order *Cynarocephalæ*, and is distinguished by the bracts of the involucre being fleshy at the base, and emarginate, with a hard point and the receptacle fringed. *C. Scolymus* has the radical leaves 3—4 feet long, somewhat spiny, some of them pinnatifid, some undivided. The stem is two or three feet high, branched, with large heads of violet-colored (sometimes white) thistle-like flowers at the summits of the branches. The involucre is tumid, and consists of fleshy, roundish-ovate, crenate, acuminate, imbricated scales. The seeds are elongated and quadrangular, with smooth and firmly attached pappus. The plant has been long cultivated for the sake of the delicate succulent *receptacles* of the heads of flowers, taken before the flowers expand, which are boiled and eaten, or, on the continent of Europe, eaten raw with salt and pepper. The part used is the same which is called the *cheese* in thistles by children, and is sometimes eaten by them. The tender central leaf-stalk is also occasionally used in the same way as that of the Cardoon. Several varieties are in cultivation, differing in the more or less spiny leaves, and the more or less globose form of the head. Artichokes are generally propagated by rooted slips or suckers in spring. These are planted in rows about four feet asunder, and two feet apart in the row. The A. bed continues productive for several years. Seaweed is an excellent manure.—The CARDOON (q. v.) belongs to the same genus.—The JERUSALEM A. (q. v.) is a totally different plant.

A'RTICLE (Lat. *articulus*, a joint) signifies in general a part of a systematic whole. Thus, we speak of the several articles of a confession; the articles of war; a leading article, &c.

The use of A. as a grammatical term arose as follows. In such a sentence as, 'He found *that* (or *the*) man *that* he was looking for,' the Greeks considered the defining particles as connecting the two parts of the sentence, and called them joints (Gr. *arthra*, Lat. *articuli*); the name was subsequently confined to the first of the two, the other being called the relative.

In English, there are two articles—the definite *the*, and the indefinite *a* or *an;* and other modern languages have corresponding words. But articles are not essential to language. The Latin had no articles, and the Greek, as well as the older Germanic languages, the Mœso-Gothic and Old Norse, e.g., had only the definite A. 'In no language,' says Dr. Latham, 'in its oldest stage, is there ever a word giving, in its primary sense, the idea of *an* or of *the*. As tongues become modern, some word with a *similar* sense is used to express the relation. In the course of time, a change of form takes place, corresponding to the change of meaning.'

The definite articles originate uniformly in demonstrative pronouns. Eng. *the* is only a weakened form of *that* (Anglo-Sax. *thæt*). The same is the case with Ger. *der;* and Fr. *le*, Ital. *il* and *lo*, and Sp. *el*, are all from the Lat. *ille*, 'that.' In like manner, *an* or *a* is from the old form of *one* (ane); Ger. *ein* is both *one* and *a;* and so are Fr. *un*, Ital. and Sp. *uno*, both from Lat. *unus=one*.

In the Scandinavian tongues, the article is attached to the end of the word; the Danish, for example, writes *kong-en*, the king; *huset*, the house.

A'RTICLES OF WAR are regulations made for the government of the military and naval forces of the country. They are of three classes—1. Those relating to the army, including therein the forces in India, according to the provisions of the 21 and 22 Vict. c. 106; 2. Those relating to the marine forces; and 3. Those relating to the navy.

1. *A. of W. for the Army.*—These regulations were formerly issued under the authority of the annual MUTINY ACT (q.v.). By the 68th sect. of the Army Discipline and Regulation Act, 1879, Articles of War can be made by the Queen for the better government of the forces, other than the marines, to whom that Act relates. The Admiralty enjoys like power in the case of marines. The Articles are to be judicially taken notice of by all judges and in all courts whatsoever; provided that no person shall by such A. of W. be subject to be kept in penal servitude, or to suffer any punishment extending to life or limb, except for crimes which the Act declares shall be so punishable. And for the enforcement of such A. of W., a power is given to the Crown to erect, or grant authority to convene, *courts-martial* to try and punish offences according to the Articles. In order, however, to limit the power conceded to the Crown in this matter, it is enacted that nothing therein contained shall be construed to exempt any officer or soldier from being proceeded against by the ordinary course of law; and that when he is accused of any offence against a subject of the realm, punishable by the laws of the land, he shall be delivered to the civil magistrate. The offences against which these A. of W. are directed, relate to the soldier's duties and obligations; to crimes and offences and their punishments; to courts-martial; and to rank. The crimes and offences referred to are those against divine worship, perjury, mutiny and insubordination, desertion and absence without leave; offences in the field, camp, garrison, or quarters; drunkenness, disgraceful conduct, false returns, billets and carriages, recruiting and miscellaneous offences. By the third Article it is ordered that every recruit shall, within ninety-six hours, have the 40th and 46th Articles read to him, and shall within ninety-six hours, but not sooner than twenty-four, make the following oath before some qualified authority: '*I do make oath, That I will be faithful and bear true allegiance to Her Majesty, her heirs and successors, and that I will, as in duty bound, honestly and faithfully defend Her Majesty, her heirs and successors, in person, crown, and dignity, against all enemies, and will observe and obey all orders of Her Majesty, her heirs and successors, and of the generals and officers set over me. So help me God.*' The 191st Article is to the effect, that whenever any forces shall have embarked on board ships of war or transports, the officers and soldiers shall, from the time of embarkation, strictly conform themselves to the laws and regulations established for the government and discipline of the ship; and shall consider themselves, for these purposes, under the command of the senior officer of the particular ship, as well as under the superior officer of the fleet (if any), to which such ship belongs. See A. of W. for the Marine Forces.

2. *A. of W. for the Marine Forces*, till 1879 made under the authority of another annual Mutiny Act, are now regulated by the Army Discipline Act. Unlike the A. of W. for the army, they do not issue directly from the Crown, but are made by the Lord High Admiral, or by the commissioners for executing that office, and they are authorized so to be made by the last-mentioned Mutiny Act. With this exception, they are much the same as the A. of W. for the army. They relate exclusively, however, to the marine forces *while on shore*, and this specialty is expressed in the preamble of the Act, which recites that 'the said forces may frequently be quartered, or be on shore, or sent to do duty, or be on board transport-ships, or merchant-ships, or vessels, or they may be under other circumstances in which they will not be subject to the laws relating to the government of Her Majesty's forces by sea.' While doing duty in any of Her Majesty's ships or vessels in commission, the marines, like other naval forces, are subject to the A. of W. for the government of the navy.

3. *A. of W. for the Navy.*—In regard to such regulations, the navy is differently situated. It is not governed by any annual Mutiny Act, but the A. of W. relating to it are contained in the Naval Discipline Act, 29 and 30 Vict. c. 109 (1866), which supplies the law of the sea-service. The Naval A. of W. were eminently Draconian, but by the Naval Courts vastly mitigated in practice. The first Naval A. of W. authorized by parliament were contained in the 13 Chas. II. c. 9, said to have been drawn up by Admiral Montague, afterwards Earl of Sandwich, with the approbation of Lord Chancellor Clarendon and other members of the privy council. But the statute and subsequent supplementary Acts were repealed by the 22 Geo. II. c. 33, the forerunner of the later Naval Discipline Act. See Mr. Prendergast's *Law of the Navy*, 1852, Part I. p. 15.

The Mutiny Act and the Marine Mutiny Act, both now superseded by the above Act of 1879, vested power to make Articles of War in the Crown and Admiralty respectively. These were very voluminous, and often merely a repetition of the clauses of the Mutiny Act, while including others relating to lesser crimes and punishments than there mentioned, as also more details as to the constitution and procedure of courts-martial. The Army Discipline and Regulation Act has so far incorporated the Mutiny Acts and the Articles published with them, that there seems but little necessity for further A. of W. to issue; while rules of procedure, issued by the Crown, under the authority of the Act, and concurred in by the Admiralty, are now published with the Act.

A'RTICLES, THE SIX, often mentioned in the ecclesiastical history of England in the 16th c., were articles imposed by act of parliament in 1539, when Henry VIII. being displeased with some of the bishops most favorable to the Reformation, their opponents for a time regained the ascendency. These A. asserted the doctrine of transubstantiation, declared communion in both kinds not to be necessary, condemned the marriage of priests, enjoined the continued observance of vows of chastity, and sanctioned private masses and auricular confession. The act imposing them was popularly called 'the six-stringed whip.' Severe penalties were appointed for writing or speaking against them, and for abstaining from confession or the sacrament at the accustomed times, for priests failing to put away their wives, and for persons writing or speaking against the doctrine of transubstantiation. Archbishop Cranmer vainly opposed the act in the House of Lords: the king was resolute to have it passed. Its severity was mitigated by a subsequent act of his reign (1544), and although it continued substantially unrepealed, it was transgressed with impunity even by ecclesiastical dignitaries.

A'RTICLES, THE THIRTY-NINE, of the Church of England, are the articles of religion which were agreed upon by the archbishops and bishops of both provinces and the whole clergy in the convocation held at London in the 4th year of Elizabeth, 1562, under Archbishop Parker. To have a clear view of the history of these important articles, we must go back to the promulgation of the original ones, forty-two in number, in the reign of Edward VI. The council appointed by the will of Henry VIII. to conduct the government during the king's minority, was for the most part favorably disposed towards the Reformed opinions, and the management of church affairs devolved almost entirely upon Archbishop Cranmer. In the year 1549, an act of parliament was passed, empowering the king to appoint a commission of 32 persons, to make ecclesiastical laws. Under this act, a commission of 8 bishops, 8 divines, 8 civilians, and 8 lawyers (amongst whom were Cranmer, Ridley, Hooper, Coverdale, Scory, Peter Martyr, Justice Hales, &c.) was appointed in 1551, and one of its first acts was to draw up a code of articles of faith. These were forty-two in number, and were set forth by the king's authority in 1553. Strype and Burnet make it appear that these forty-two articles were agreed upon in the convocation that was sitting in 1552, but this was not the case. Fuller, speaking in his quaint way of this convocation, declares that it had 'no commission from the king to meddle with church business, and,' he adds, 'every convocation in itself is born deaf and dumb, so that it can neither hear nor speak concerning complaints in religion till first *Ephphatha*, "Be thou opened," be pronounced unto it by royal authority.'

'However,' he continues, 'this barren convocation is entitled the parent of those forty-two articles which are printed with this title, *Articuli de quibus in Synodo Londinensi* 1552 A. D. *inter Episcopos et alios concenerat.*' To these articles was prefixed the Catechism, and there is no doubt of Cranmer having had the principal hand in their composition; for he owned before Queen Mary's commission that they were his doing. But immediately after their publication, Edward died, and one of the first acts of the convocation summoned with the parliament in the first year of Queen Mary, was to declare that these forty-two articles had not been set forth by the agreement of that House, and that they did not agree thereto. In 1558, Elizabeth succeeded her sister. In 1559, Parker was installed in the see of Canterbury, and immediately the other vacant sees were filled up. And now came a fresh opportunity of drawing up some articles of faith which might serve as a test of orthodoxy in the Reformed Church. Parker applied himself to this work, and for the purpose, revised the forty-two articles of King Edward, rejecting four of them entirely, and introducing four new ones, viz., the 5th, 12th, 29th, and 30th as they now stand, and altering more or less seventeen others. This draft Parker laid before the convocation which met in 1562, where further alterations were made; and the 39th, 40th, and 42d of King Edward's, which treated of the resurrection, the intermediate state, and the doctrine of the final salvation of all men, were finally rejected. The 41st of King Edward's, which condemned the Millenarians, was one of the four which Parker omitted. Thus the articles were reduced to thirty-nine. They were drawn up and ratified in Latin, but when they were printed, as was done both in Latin and English, the 29th was omitted, and so the number was further reduced to thirty-eight. From these thirty-eight there was a further omission, viz., of the first half of the 20th article, which declares that 'the church hath power to decree rites and ceremonies, and hath authority in controversies of faith.' As all the records of

convocation perished in the great fire of 1666, it is very difficult to ascertain how these omissions arose. However, in 1571. the articles once more underwent revision. Archbishop Parker and Bishop Jewel made a few trifling alterations, and the 29th being restored, the convocation which was then sitting ratified them both in Latin and English, and an act of parliament was passed in that year compelling the clergy to subscribe 'such of them as only concern the confession of the true Christian faith, and the doctrine of the Sacraments. There still, however, remained some difficulty as to which was the authorized copy, some of the copies being printed with, and others without, the disputed clause of the 20th; but this was finally settled by the canons passed in the convocation of 1604, which left the thirty-nine articles as they now stand. 'His Majesty's Declaration,' which precedes them, and directs that they shall be interpreted 'in their literal and grammatical sense,' was prefixed by Charles I. in 1628.

It may be interesting to know from what other sources the thirty-nine articles are derived. Some of them, as the 1st, 2d, 25th, and 31st, agree not only in their doctrine, but in most of their wording, with the Confession of Augsburg. The 9th and 16th are clearly due to the same source. Some of them, as the 19th, 20th, 25th, and 34th, resemble, both in doctrine and verbally, certain articles drawn up by a commission appointed by Henry VIII., and annotated by the king's own hand. The 11th article, on justification, is ascribed to Cranmer, but the latter part of it only existed in the articles of 1552. The 17th, on predestination, may be traced to the writings of Luther and Melanchthon.

The thirty-nine articles have been described as 'containing a whole body of divinity.' This can hardly be maintained. They contain, however, what the Church of England holds to be a fair scriptural account of the leading doctrines of Christianity, together with a condemnation of what she considers to be the principal errors of the Church of Rome, and of certain Protestant sects. As far as they go (and there are many things unnoticed by them) they are a legal definition of the doctrines of the Church of England and Ireland; though it is to the *Book of Common Prayer* that members of that communion look for the genuine expression of her faith. They were adopted by the convocation of the Irish Church in 1635, and by the Scotch Episcopal Church at the close of the 18th century. Corpus Christi College, Cambridge, contains the only copies of the A. in manuscript or print that are of any authority. Amongst them are the Latin manuscript of the A. of 1562, and the English manuscript of the A. of 1571, each with the signatures of the archbishops and bishops who subscribed them. See *An Account of the Thirty-nine A.*, by Dr. Lamb.

For other 'Articles,' see LAMBETH, PERTH, and SCHMALKALD.

ARTICULA'TA (or ARTICULATED ANIMALS), one of the great primary divisions of the Animal Kingdom, according to the system of Cuvier (see ZOOLOGY), and including those animals of which the body is distinctly segmented—the higher worms, as well as Insects, Crustaceans, Arachnids and Myriapods. The four latter groups were separated from the Annelida (q. v., and see also the article WORMS) by Von Siebold, on account of their possession of hollow jointed limbs, into a separate subkingdom, Arthropoda.

ARTHROPODA.—In this great division of the Animal Kingdom, the body consists of a usually definite number of segments, each bearing a pair of hollow and almost always jointed limbs, into which the body muscles proceed.

In all cases, the epidermis gives rise to an external horny layer of *Chitine* (q. v.) which usually attains considerable strength and thickness, and in Crustaceans is further strengthened by impregnation with salts of lime. The segments of the body and their corresponding appendages exhibit a considerable degree of differentiation, especially in the anterior region of the body, where also some or many segments may completely coalesce, their appendages also becoming extraordinarily modified for various functions; so that it requires the combined research of both the embryologist and the comparative anatomist, to analyze the organism into its constituent parts. The nervous system is a ventral chain of ganglia united by longitudinal and transverse commissures, and one pair of ganglia is developed for each segment, although some of these also coalesce more or less completely in the adult.

The A. divide naturally into two great alliances—the water-breathers, or *Branchiata* (see GILLS), and the air-breathers, or *Tracheata* (see RESPIRATION); the former including the *Crustacea*, and the latter the *Prototracheata* or *Peripatidea*, the *Myriapoda*, the *Arachnida*, and the *Insecta*. The relation of the Arthropoda to other groups will best be understood from the article ZOOLOGY. Separate articles will be found on the CRUSTACEA, MYRIAPODA, ARACHNIDA, and INSECTS; the group *Peripatidea* having been most recently established as a distinct class.

The *Peripatidea* are represented by a single genus, *Peripatus*, which appears, both from its extreme simplicity of structure and its wide distribution (S. America and the Antilles, S. Africa, New Zealand) to be of very remote antiquity. At first supposed to belong to a mere subclass of Annelids, its arthropod character was only established during the voyage of the *Challenger*, by the discovery of distinct tracheæ, which open irregularly over the surface of the body, instead of being disposed in regular relation to the segments. Its segments and their appended limbs, its visceral anatomy, and its development are all distinctly arthropodan, and show that we have here almost the most primitive imaginable form of the Tracheate Arthropoda. *Peripatus* is about 1½ inches long, inhabits decayed wood, and has the curious and suggestive habit of spinning a web over itself when alarmed. (See Moseley. *Notes of a Naturalist in the Challenger.*)

ARTICULATION. See JOINTS.

ARTIFI'CIAL LIMBS. With the exception of the celebrated artificial hand of the German knight, Götz von Berlichingen*—who flourished in the early part of the 16th c. (1513), and who was named *The Iron-handed*—which weighed 3 pounds, was so constructed as to grasp a sword or lance, and was invented by a mechanic of Nuremberg, our knowledge of artificial limbs dates from the time of Ambrose Paré whose *Œuvres de Chirurgie* were published in 1575. The twelfth chapter of that volume, as translated by Thomas Johnson in 1605, shows 'by what means arms, legs, and hands may be made by art, and placed instead of the natural arms, legs, and hands that are cut off or lost.

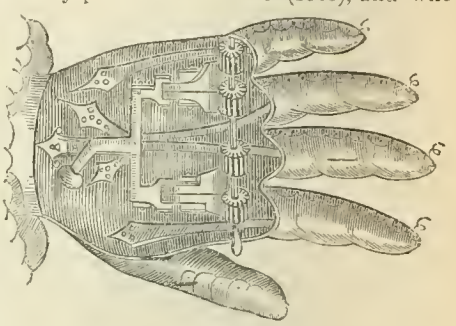

Fig. 1.

The accompanying figures are copies of his drawing of 'an hand made artificially of iron (fig. 1),' and of 'the form of an arm made of iron verie artificially (fig. 2).' He also gives a drawing of 'a wooden leg made for a poor man' (fig. 3), which is simply the common wooden leg with bucket receptacle still in use. No improvements worthy of record were made from the time of Abrose Pare to the beginning of the present century, when Baillif of Berlin constructed a hand which did not exceed a pound in weight, and in which the fingers, without the aid of the natural hand, not only exercised the movements of flexion and extension, but could be closed upon and retain light objects, such as a hat and even a pen. 'Artificial hands,' says Mr. Heather Bigg, 'are now constructed, by means of which a pin may be picked up from the ground, a glass raised to the lips, food carried to the mouth, and a sword drawn from its scabbard, and held with considerable firmness; while a combined arm and hand is fabricated, which is equal to the ordinary requirements of histrionic declamation.'—*Orthopraxy*, 1865. p. 157. The utility of an artificial arm depends much on the nature of the stump. A stump above the elbow is best suited for an arm when it gradually tapers to its lowest end, and terminates in a rounded surface. When an arm is removed at the shoulder-joint, and there is no stump, an artificial arm can still be fixed in its proper place by means of a corset. In amputation below the elbow joint, the best stump is one which includes about two-thirds of the fore-arm; while a stump formed by amputation at the wrist is very unsatisfactory. The simplest form of artificial arm intended to be attached to a stump terminating above the elbow, 'consists of a leathern sheath accurately fitted to the upper part of the stump. The lower end of the sheath is furnished with a wooden block and metal screw-plate, to which can be attached a fork for holding meat, a knife for cutting food, or a hook for carrying a weight.'—*Op. cit.* p. 160. The arm should be so carried as to represent the position of the natural arm when at rest. It is

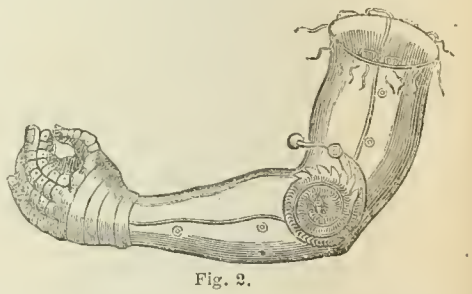

Fig. 2.

* The iron hand of this knight, who has been immortalized by Goethe, is preserved at Jaxthausen, near Heilbronn, and a duplicate of it is in the Schloss at Erbach, in the Odenwald. It is stated in Scott's *Border Antiquities*, vol. ii., p. 206, that the family of Clephane of Carslogie 'have been in possession from time immemorial of a hand made in the exact representation of that of a man, curiously formed of steel,' which was conferred by one of the kings of Scotland on a laird of Carslogie, who had lost his hand in the service of his country.—See *Notes and Queries* for July 17, 1867, p. 35.

retained in its position by shoulder and breast straps, and forms a light, useful, and inexpensive substitute for the lost member. More complicated, and therefore more expensive pieces of apparatus are made, in which motion is given to the fingers, a lateral action of the thumb is obtained, and the wrist-movements are partially imitated; and a degree of natural softness is given to the hand by a covering of gutta-percha and India-rubber. Such a hand, says Mr. Bigg, is often more symmetrical in aspect than the natural hand, but it possesses no efficient grasping power. Hence provision has to be made for attaching various instruments to its palm, such as special hooks, which can be removed at pleasure, for driving, shooting, &c.; apparatus for using the knife and the fork, for grasping the pen, &c.: indeed, the number and variety of instruments capable of being applied to an artificial hand are extremely great. Nothing has tended so much to the very highest development of artificial arms and hands, as an accident which happened more than a quarter of a century ago to the celebrated French tenor, M. Roger, who lost his right arm above the elbow.

It was necessary, for his future appearance on the stage, that he should have an artificial limb, which would serve the purposes of histrionic action, and permit him to grab a sword and draw it from its scabbard. Such a contrivance was invented in 1845 by Van Petersen, a Prussian mechanician, and the French Academy of Sciences commissioned MM. Gambey, Rayer, Valpeau, and Magendie to report upon it. For a history of the nature of the limb, the reader is referred to the report which appeared in the *Comptes Rendus* for that date, or to Mr. Bigg's *Orthopraxy*, pp. 176—181. The apparatus, which weighs less than 18 ounces, was tested upon a soldier who had lost both arms. By its aid he was enabled to pick up a pen, take hold of a leaf of paper, &c.; and the old man's joy during the experiment was so great, that the Academy presented him with a pair of these arms. Van Petersen's conceptions have been extended and improved by Messr. Charriere, the celebrated surgical mechanics of Paris, aided by M. Huguier, the well-known surgeon. A very marvelous arm has also been almost simultaneously constructed by M. Bechard, which, 'by means of a single point of traction, placed in pronation, executes first the movement of supination, next in succession the extension of the fingers and abduction of the thumb: the hand is then wide open.' —Bigg, *op. cit.* p. 190.

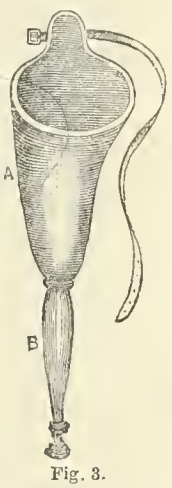

Fig. 3.

Artificial legs having fewer requirements to perform than artificial arms, are comparatively simple in structure. We borrow the description of our figure of the ordinary bucket leg in common use amongst the poorer classes from Mr. Bigg's *Orthopraxy*. 'It consists of a hollow sheath or bucket, A, accurately conformed to the shape of the stump, and having—in lieu of the more symmetric proportions of the artificial leg—a 'pin,' B, placed at its lower end to insure connection between it and the ground. This form of leg is strongly to be recommended when expense is an object, as it really fulfils all the conditions excepting external similitude embraced by a better piece of mechanism. It is likewise occasionally employed with benefit by those patients who, from lack of confidence, prefer learning the use of an artificial leg, by first practicing with the commonest substitute.' As, when the body rests on a single leg, the center of gravity passes through the tuberosity of the ischium, it is essential that the bucket should be so made as to have its sole point of bearing against this part of the pelvis.

Of the more complicated forms of artificial leg three are especially popular. The first of these is of English origin, and owing to its having been adopted by the late Marquis of Anglesea, is known as the *Anglesea leg*. For a description of it, the reader is referred to Gray's work on *Artificial Limbs*, one of the firm of Grays having been the constructor of the legs used by the marquis. This was for a long time *the* fashionable artificial leg. The second leg worthy of notice is that invented by an American named Palmer, and called the *Palmer leg*. From its lightness and the greater ease of walking with it, it has long superseded the Anglesea leg in America. In the third of these legs, also invented in America, and known as *Dr. Bly's leg*, the principal faults of the two other legs have been completely overcome. The advantages of this leg are thus summed up by Mr. Brigg, who has fully described and figured its mechanism: (1.) Adaptation to all amputations either above or below the knee. (2.) Rotation and lateral action of the ankle-joint. (3.) Power on the part of the patient to walk with ease on any surface, however irregular, as, owing to the motion of the ankle-joint, the sole of the foot readily accommodates itself to the unevenness of the ground, which is an advantage never before possessed by any artificial limb. (4.) The ankle-joint is rendered perfectly indestructible by ordinary wear, owing to its center being composed of a glass ball resting in a cup of vulcanite; thus it never gets out of repair, as the Anglesea leg but too frequently does, and the original cost is almost the only one the patient incurs. (5.) The action of the ankle-joint is created by five tendons, arranged in accordance with the position assigned to them in a natural leg. These tendons are capable of being rendered tight or loose in a few instants, so that the wearer of the leg has the the power of adjusting with precision the exact degree of tension from which he finds the greatest comfort in walking, and also of giving the foot any position most pleasing to the eye. (6.) There is a self-acting spring in the knee-joint, urging the leg forward in walking, and imparting automatic motion, thus avoiding the least trouble to the patient, who finds the leg literally and not metaphorically walk by itself. (7.) The whole is covered by a beautiful flesh-colored enamel, thus avoiding the clumsy appearance of the wood, as is always found in an Anglesea leg, admitting of its being washed with soap and water like the human skin. (8). At the knee-joint there is a mechanical arrangement representing the crucial ligaments, and affording natural action to that articulation by which all shock to the stump in walking is avoided. This leg is patented, and as might be expected, is somewhat expensive.

In cases of arrested development of the lower limbs, short-legged persons may be made of the ordinary height by the use of two artificial feet placed twelve or more inches below the true feet, and attached to the legs by means of metallic rods, jointed at the knee and ankle.

Other parts not entitled to be called limbs, can also be replaced by mechanical art—such as the nose, lips, ears, palate, cheek, and eye. In the present advanced state of plastic surgery, deficiencies of the nose, lips, and palate can usually be remedied by an operation; cases, however, may occur where an artificial organ is required. Artificial ears are molded of silver, painted the natural color, and fixed in their place by a spring over the vertex of the head. Loss of an eye causes sad disfigurement; but the artificial eyes of Boissonneau (see his *Renseigements Généraux sur les Yeux Artificiels, leur Adoption et leur Usage*), which have been shown in all the recent public exhibitions, completely throw all others in the shade, and cannot be detected without the closest inspection. For further details on all these subjects we must refer to Mr. Bigg's volume, which is a complete encyclopædia on these and allied topics.

ARTILLERY sometimes means large cannon or ordnance of every kind; sometimes it includes the shot and shell; sometimes it applies to the soldiers who manage the cannon. In the present work, the large pieces of ordnance, as a class, are described under CANNON; specialties are noticed at CARRONADE, HOWITZER, GUN, MORTAR, &c.; and in some cases under the names of the inventors, as ARMSTRONG GUN, LANCASTER GUN, &c. See also FIREARMS, RIFLED ARMS, GUNNERY, SHELLS, SHOT. It may, however, be well here to explain that the term *Equipment of A.* is applied to a combination of men, material, and horses, suitable for coast-defences, sieges, or the arming of fortified posts. There are several kinds of equipments of *light* A., under the names of horse, field, rocket, mountain, and reserve; and others of *heavy* A., for the attack and defence of coasts and fortified places. These various equipments are generally divided into smaller collections called *Batteries* (q. v.), for more easy control and manœuvring. *Park of A.* is a collective name given to the whole of the guns, carriages, ammunition, and other appurtenances essential to the working of field or siege A.

Artillery Corps.—Before the invention of gunpowder, the larger projectile weapons, sometimes called *engines of war*, sometimes *artillery*, were worked by rough soldiers, who needed no particular apprenticeship to that art. When, however, large balls of iron came to be propelled by the irresistible force of gunpowder, a great revolution gradually took place, though garrison-guns and siege-guns were improved more rapidly than field-guns. Nevertheless, field-guns changed the whole aspect of military tactics; for it became necessary that an army should form in order of battle at a much greater distance from the enemy than in older times. And when the cannon were made more rapidly movable, so did tactics vary. Gradually, a body of men were set apart to study the force and action of gunpowder, the flight and range of projectiles, the weight and strength of cannon, and the manœuvring of heavy masses. The French were the first to make these researches; after them, the English; and still later, the Germans. During the Thirty Years' War, an important step was taken in Germany—that of including the artillerymen, who were till then a sort of guild, as a component in the regular army. Gustavus Adolphus in Sweden, Frederick II. in Prussia and Napoleon I. in France, all attached a very high degree of importance to the A. as an arm of the service. After the great wars in the beginning of the present century, nearly all the states of Europe formally recognized the A. as the third great branch of military service (next after the infantry and cavalry); indeed, in almost all present armies, it takes practically the first place.

A. corps, or artillerymen, are divided into land-A. and marine-A. The land-A. is divided into field, coast, garrison, and siege A. The field-A. is sub-divided into horse and foot. There are also the special appellation of reserve, light and heavy A. In most European states, the artillerymen are divided into regiments, battalions, brigades, and companies; but in Britain the whole form one enormous regiment, which is expanded or contracted according to the exigencies of the service. See below.

When military men speak of *the* field-A., they usually include cannon, carriages, horses, ammunition, and stores of every description, as well as the artillerymen. The distinction between heavy and light A. depends on the size of the cannon, and the weight of the shot and shell propelled from them. For obvious reasons the construction of very large field-guns is avoided. Military men are not quite agreed as to the precise figures; but there was in the time of Napoleon I. a general concurrence in opinion that a well-appointed field-force should have two or three A. guns to every 1000 infantry, and five or six horse A.-guns to every 1000 cavalry. The proportion is necessarily affected by the kind of country and the amount of available transport. During the Peninsular War, Wellington had seldom more than 1 gun to every 1000 soldiers; when he entered France, he had 3 to the 1000. Napoleon preferred 2 per thousand, with a larger supply of ammunition than had before been deemed necessary; and many foreign governments followed his example. Since the Franco-German war, it is held that there should be always with the army 3 guns per 1000 infantry.

The Royal Regiment of Artillery is the collective name for the whole of the A. belonging to the British army. Under *Artillery Corps*, the origin of similar bodies on the continent of Europe is briefly noticed. There was no regular regiment or corps of A. soldiers in the English army till the time of Queen Anne, when the present Royal Regiment was formed. Since that period, from some anomaly difficult to explain, all the additions have been made to the same regiment, instead of forming new regiments, to be combined into a division or corps. The regiment is now almost an army in itself; and to increase the anomaly, it comprises horse as well as foot. The foot-A., with medium guns, attend infantry in the battle-field; and with heavier guns, besiege and defend fortified places; while the horse-A., with lighter guns, accompany the cavalry. The mounted artillerymen were organized long after those who manœuvre on foot. Though both corps form one regiment, they have distinct designations—the *Royal A.*, and the *Royal Horse-A.* Besides these two corps, the regiment is considered to include the *Master Gunners* and the *Coast Brigade*.

The regiment has varied from 18,000 to 36,000 strong (including those placed upon the East India establishment), during the last 20 years. Formerly, the foot were divided into *battalions*, and the horse into *troops*. Each company, with its quota of guns and stores, constituted a *field-battery;* and each troop, with its quota, constituted a *horse-battery*. The terms 'company' and 'troop' are now altogether abandoned as being properly applicable to infantry and cavalry, and both foot and horse are divided into *brigades* and *batteries*. Under the old organization, there was no major among the working officers, the designations being captain, second-captain, and lieutenants. The grades now are major, captain, and three lieutenants per battery. A battalion in former times usually comprised eight companies. When the number of the regiment was 18,000, it comprised 119 companies and troops, averaging somewhat over 150 men each; at other times, the companies varied from 130 to 200 men each. At present, a brigade usually comprises 8 batteries of horse, or 10 of field, or 7 of garrison A. A horse-battery has 5 officers and 151 men; a field-battery (at home), 5 officers and 152 men; and a garrison-battery, 4 officers and from 100 to 150 men, according to the guns of position in its charge. The brigades of foot-A. are designated by ordinal numbers; the brigades of horse-A. are designated by letters, from A to F (omitting E). In the old nomenclature, the companies and battalions of foot-A. had numbers—i.é., 6th company, 12th battalion; and the troops of horse-A. were designated by letters.

The following table, from the Army Estimates of 1882—1883, shows the numbers of the force:

ROYAL ARTILLERY.		
Commissioned officers	1,072	
Non-commissioned officers	1,807	
Rank and file	25,470	
Horses		7,576
ROYAL HORSE-ARTILLERY.		
Commissioned officers	181	
Non-commissioned officers	271	
Rank and file	3,978	
Horses		3,344
Total men	32,779	
Total horses		10,920

Of this number of men 12,065 are placed at the disposal of the East Indies, to be paid for out of Indian revenues. A general order was issued in April, 1882, giving details of the new organization of the Royal A. The former divisions of this regiment (which is the largest in the world, numbering some 21,000 men) were 3 brigades of horse, 6 of field, and 5 of garrison A. The new organization provides for 2 horse brigades, 4 field brigades, and 11 divisions of garrison A., in each of which the first brigade consists of regulars, while the Militia Artillery regiments in each district are formed into the junior brigades of their divisions, to each of which a territorial designation is given. The first, or Northern Division, has its headquarters at Newcastle, and the Durham, Northumberland, and Yorkshire Artillery are attached to it. The second, or Lancashire Division, includes the Lancashire Militia, and is domiciled at Liverpool. The third, or Eastern Division, hails from Yarmouth, and its second and third brigades are furnished by the Norfolk and Suffolk Artillery Militia. The fourth is the Cinque Ports Division, stationed at Dover, and embracing the Kent and Sussex Militia. The fifth, or Woodwick Division, is formed entirely of regulars, and contains only one brigade. The Southern Division has its depot at Portsmouth, and takes in the Hants and Isle of Wight regiments; and the Western Division at Plymouth takes charge of the Devon and Cornwall regiments. A Scottish and a Welsh Division absorb the militia regiments at each of their districts, their headquarters being at Leith and Pembroke Dock respectively; and the North and South Irish Divisions, with depôts at Carrickfergus and Cork, account for the militia of the sister isle. Recruiting for the Royal A. will be carried on by the infantry regimental district officers. See also the articles BATTERY, ARMY ORGANIZATION, AND MARINES.

The Honorable Company of Artillery is the oldest volunteer corps in Britain. Four military bodies—the *Artillery Company*, the *Sergeants-at-Arms*, the *Yeomen of the Guard*, and the *Gentlemen Pensioners*, were established as far back as the time of the Tudors; they all still exist, but under greatly altered circumstances. In 1537, Henry VIII. granted a patent creating a guild ultimately known as 'The Masters, Rulers, and Commonalty of the Fraternity or Guild of Artillery of Long-bows Cross-bows, and Hand-guns.' Its members were empowered to keep arms and to exercise themselves in shooting. In 1638 the corporation of the city of London presented to the Company the plot of ground ever since called the Artillery Grounds, near Moorfields, as a field for military exercise. Royal princes frequently enrolled themselves as members of the Company, usually as 'captain-general.'

In 1719, George I. issued an order that all the commission and staff officers of the City Train-bands (a metropolitan militia) should become members of the Company, and exercise with the other members at all convenient times. The word 'artillery' had heretofore been considered as applying to bows and arrows as well as to firearms; but the members of the Company, like other marksmen, had almost abandoned archery, without, however, making any change in their designation. The Company, like many other city guilds, has nearly outlived its original purpose. In 1780, when the 'Lord George Gordon riots' afflicted the metropolis, the members of the Company effectually protected the Bank of England; in 1848 and again in 1859, the Company was on the alert to render good service if needed; but it has never been engaged in actual warfare with an enemy.

The Company consists of members elected by the ballot of a Court of Assistance, consisting of officers and others *ex officio*, and twenty-four annually elected. The members pay two guineas annual subscription, and £5 entrance fee, and supply themselves with uniforms, but not with arms and accoutrements. These payments, together with the rental received from some real property, constitute the fund out of which the expenses are defrayed. The members learn rifle-shooting as well as artillery practice; there are meetings twice a week at Moorfields; and every summer there are certain days of camping at some country place. The corps comprises six infantry companies, a troop of light cavalry, who furnish their own horses; and a battery of A., as well as a company of veterans. Until 1849, the members elected their own officers; but since that year the crown has appointed them. The lieutenant-colonel appoints the non-commissioned officers. The total number of all arms, is about 600. The regiment has of late years taken a very good position in shooting at Wimbledon. Martini-Henry rifles were lately served out to them, instead of Sniders, a privilege not accorded to the same extent, as yet, to other volunteer regiments. The Company is also the only volunteer body allowed to march through the streets with bayonets fixed. Compare G. H. Raikes *History of the Hon. Artillery Company*, 2 vols.

Artillery Schools.—The first school for A. instruction was established by the Venetians in the beginning of the 16th century. Soon afterwards, Charles V. established similar schools at Burgos and in Sicily. The French founded a school of practical A. in 1675; and in 1679, they added to it a theoretical school at Douai. At present, France has no fewer than seven such establishments. Saxony had an A. school in 1766; but the other German states were more tardy in this work. In Prussia, the A. and engineer schools are combined; but in others of the European states, a

separation between these two arms of the science is made. In most schools of A., the officers' studies comprise mathematics, as much of physics and chemistry as is necessary to the duties of an artillerist, field and permanent fortification, garrison-warfare, field-tactics, military history and topography, military surveying and sketching, drawing from the model, &c. The practical exercises include the serving and firing of guns and mortars, the laying out and constructing of field-batteries, and the operations of the laboratory and A. workshop.

The headquarters for A. instruction in England are at Woolwich. A *Royal Military Academy* was established there in 1741, to impart professional instruction to the artillerists and engineers belonging to the royal army. The East India Company sent their A. cadets to this Academy from the year 1798 to 1810; but afterwards, until 1861, they maintained a separate establishment at Addiscombe (which, however, was not wholly for artillery). At the present day, the students in the Academy are recruited by fair open competition. They enter between the ages of seventeen and twenty; and they remain two years, or such longer time as may fit them to pass an examination for the Royal A. or Engineers. The sons of military officers are admitted on lower terms than those of other persons. The financial control is under the Secretary of State for War; but the Commander-in-chief regulates the discipline and internal arrangements. There are 22 professors and instructors of various kinds. Besides this Royal Military Academy, there is at Woolwich a *Department of A. Studies*, for the instruction of junior officers of A., and for facilitating their visits to the fortifications and public works of foreign countries. There is also a *Select Committee*, whose duties are not so much educational as experimental; it is a small establishment for examining and reporting on the numerous inventions relating to artillery, brought before the War Office. The School of Gunnery at *Shoebury Ness*, subordinate to the headquarters of the A. at Woolwich, is for experiments upon ordnance, gunpowder, and projectiles, and to exercise young A. officers in the practical and mechanical duties of their profession. See ARTILLERY in AM. SUPP.

ARTIODACTYLA. The great mammalian order Ungulata (see MAMMALIA; UNGULATA) is divided into two groups; first, the *Perissodactyla*, including the horse, tapir and rhinoceros, besides a multitude of extinct forms, and distinguished by the third digit of each limb being symmetrical in itself, by the presence of an odd number of digits on the hind-foot, by the number of dorso-lumbar vertebræ being at least twenty-two, and so on; while the second sub-order, the *Artiodactyla*, possess the third digit, unsymmetrical in itself, but forming a symmetrical pair with the fourth digit. While the hind-foot bears an even number of digits, the number of dorso-lumbar vertebræ never reaches twenty-two, and rarely exceeds nineteen. Numerous minor osteological differences exist between the two sub-orders, which broadly correspond to the ancient divisions of solid-hoofed and cloven-hoofed respectively. In the article FOOT will be found some details as to the differences in the feet of various animals of the ungulate order.

The A. again divide into two groups—the *Non-Ruminantia* and the *Ruminantia*. The former have usually more than one pair of upper incisors, and the molars have a more or less tuberculated pattern, whence they are frequently called *Bunodonta*. The metacarpal and metatarsal bones remain separate, and there are no horns. The stomach has rarely more than two divisions. The *Non-Ruminantia* include two existing families, *Suidæ* and *Hippopotamidæ*. The *Suidæ* (pigs) have the skin moderately thick and hairy; the third and fourth toes are much longer than the second and fifth. The teeth are frequently as many as forty-four, and the molars are multituberculate. The *Hippopotamidæ* have the skin extremely thick, with scanty hairs; the head, body, and limbs extremely massive; and the four toes all resting on the ground. The *Ruminantia* have never more than one pair of upper incisors. In the lower jaw, the canines closely resemble and are situated beside the six incisors, which thus seem to have increased to eight. The molars bear a double series of crescentic ridges, whence the name *Selenodonta* is frequently applied to the ruminant group. The stomach has at fewest three, and usually four divisions. Thus in the sheep or ox, the cardiac portion of the stomach is differentiated into the enormous *rumen*, or paunch, and the *reticulum*, or honey-comb stomach, with which it communicates. After the fodder has been chewed again, it passes readily into the third division, the *psalterium*, or manyplies, which acts as a filter, and only allows the finely-comminuted portions of the food to enter the highly glandular *abomasum*, or rennet stomach, in which gastric juice is secreted, and proteid digestion goes on.

The existing groups of ruminants are the *Tragulidæ*, the *Cotylophora*, and the *Camelidæ*. The *Tragulidæ* (sometimes erroneously termed musk-deer) are the least differentiated forms, and show interesting affinities to the non-ruminants. The *Cotylophora*, including the ox and deer tribes (Bovidæ and Cervidæ), are the central family, which are broadly distinguished by the cotyledonary placenta and the structure of their horns; those of the Cervidæ being naked, deciduous, and annually renewed processes of the frontal bones; while those of most Bovidæ (sheep, antelopes, oxen, buffaloes) are non-deciduous processes of the frontal bones, covered by the thickened and hardened epidermis known as horn. But in one sub-family, the giraffes, the horns arise as separate ossifications, and are covered by hairy skin.

The third family, the *Camelidæ*, are aberrant ruminants. They walk on broad integumentary cushions, developed below the phalanges of the third and fourth toes, which are alone developed, the nails not forming hoofs. Large pointed canines are present in each jaw. The stomach has a characteristic structure. The placenta is diffused. There are only two existing groups—the Camels of the Old World, and the Llamas of the New.

See RUMINANTIA, BOVIDÆ, DEER: also HOG, HIPPOPOTAMUS; ANTELOPE, SHEEP, OX, BUFFALO, GIRAFFE, CAMEL, LLAMA, ALPACA, &c.

ARTOCARPA'CEÆ, a natural order of Monochlamydeous exogens, of which the Bread-fruit (*Artocarpus incisa*) is the type; very nearly allied to that of *Moraceæ* (Mulberries, Figs, &c.), and, like it, by many botanists regarded as a sub-order of *Urticaceæ* (Nettles, &c.). The distinction between Artocarpaceæ and Moraceæ lies chiefly in the straight embryo and large cotyledons of the former. The fruit is often a *sorosis* (a single succulent fruit formed of the aggregated ovaries of a whole head of flowers) as in Bread-fruit (q. v.). There are upwards of fifty known species, natives exclusively of the tropics. The milky juice of some yields CAOUTCHOUC (q. v.); and that of a few species is so bland as to be used as a substitute for milk (see COW-TREE). The juice of others is, however, very poisonous, as that of *Antiaris toxicaria*, the Antjar poison, one of the poisons called Upas by the Javanese. The fruits are wholesome; the importance of Bread-fruit in the South Sea Islands is well known; and the seeds of the *Musanga* of the Gold Coast of Africa, and of *Brosimum alicastrum* in the West Indies, are eaten as nuts. The fibrous bark of the Bread-fruit Tree is made into cloth; its wood is used for building, its male catkins for tinder; its leaves serve as substitutes for table-cloths and wrapping-papers, and its milky juice for birdlime. The bark of *Antiaris saccidora* is used in Western India for making sacks, which are formed by cutting a branch of the dimensions of the sack wanted, and simply turning back and drawing off the bark after it has been soaked and beaten, the wood being sawn off so as to leave a little portion to form the bottom of the sack. The fibrous bark of *Cecropia peltata*, or Trumpetwood, is used for cordage. The stem and branches are hollow, and are used for wind instruments. The wood of some species is valuable, such as *Letter-wood* (q. v.).

Bread-fruit (*A. incisa*).

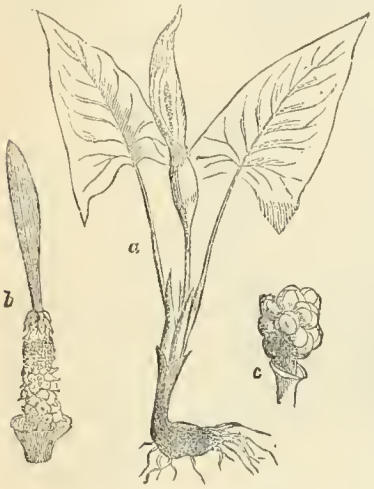
ARTOIS was formerly a province of France, bounded by Flanders and Picardy, and almost corresponding with the modern department of *Pas-de-Calais* (q. v.). The capital of A. was Arras. Louis IX., in 1239, made A. a county, and gave it to his brother Robert, who was succeeded by his son, Robert II., surnamed Posthumous, who died in 1302. Afterwards it passed into the hands of Flanders and Burgundy, but was ceded to France by treaties in 1659 and 1678. Charles X., in his early life, and also after his abdication, was known by the title of Count d'Artois.

ARTS, DEGREES IN. The term 'Arts,' or 'Liberal Arts,' as technically applied to certain studies, came into use during the middle ages, and on the establishment of universities, the term 'Faculty of Arts' denoted those who devoted themselves to Science and Philosophy, as distinguished from the faculty of Theology, and afterwards of Medicine and Law. The number of 'Arts' embraced in the full medieval course of learning was seven: Grammar, Logic, Rhetoric (constituting the *Trivium*), Music, Arithmetic, Geometry, and Rhetoric (the *Quadrivium*). The terms Master and Doctor were originally applied synonymously to any person engaged in teaching. In process of time, the one was restricted to the liberal arts, the other to Divinity, Law, and Medicine. When regulations were established to prevent unqualified persons from teaching, and an initiatory stage of discipline was prescribed, these terms became significant of a certain rank, and of the possession of certain powers, and were called *gradus*, 'steps' or 'degrees.' The

passing of the initiatory stage, said to have been first instituted by Gregory IX. (1227—41), conferred the title of *bachelor* (q. v.), and an additional course of discipline and examination was necessary to obtaining that of *master*. The title of Master of Arts originally implied the right, and even the duty of publicly teaching some of the branches included in the faculty of Arts; a custom which is still retained, to some extent, in the German universities, but has fallen into disuse in Britain and France, where the title is nearly honorary. The subject will be more fully considered under the general head of DEGREE. LL.A. (Literate in Arts) is a minor degree, recently instituted at some of the Scottish universities, and at St. Andrews is open to women. The degrees of Bachelor and Doctor of Science are granted for eminence in subjects some of which belong to the Faculty of Arts.

ARTVI'N, a town of Asiatic Turkey, in the vilayet of Trebizond, 100 miles east from the town of Trebizond. The inhabitants, about 6500 in number, mostly belong to the Roman Catholic Church.

A'RUM, a genus of Spadicifloral endogens, belonging to the natural order *Araceæ* or *Aroideæ*. This order comprises herbaceous plants, some of which are stemless; shrubby plants, some of which are arborescent; and plants which climb by aërial roots, clinging to the trees of tropical forests. The leaves are sheathing at the base, convolute in bud, usually with branching veins. The flowers are male and female, naked, arranged upon a *spadix*, which is generally enclosed in a *spathe* (q. v.); the male flowers at the upper part of the spadix, and the female flowers at its base. The ovary is free. The fruit is succulent, the seeds pulpy, the embryo in the axis of fleshy or mealy albumen, with a lateral cleft in which the plumule lies; the albumen, however, is wanting in some plants of the order.—As thus defined, this order contains almost 200 known species, natives chiefly of tropical countries, but some of the herbaceous kinds belong to colder climates.—The limits of the order are, however, sometimes extended, so that it includes as suborders *Typhaceæ*, *Pistiaceæ*, &c.—The genus *A.* has a convolute spathe; the spadix naked at the point. In some species, a stench like that of carrion is produced during flowering, as well as a remarkable degree of heat. Plants are of course slightly warmer than the air around them, the heat being produced by the breaking up and oxidation of their protoplasm, and by the true respiration, in short, which goes on in all living tissues (see ANIMAL HEAT; but flowers, in general, are only 1°, or 1½°, warmer than the air, whereas the flowers of some of the Arums and nearly allied plants are sensibly warm to the touch, and that of *A. cordifolium* has been found to have a heat of 120° F., while that of the air was only 66° F.



Arum maculatum.
a, leaves and root; *b*, spathe, with base of spadix exposed; *c*, fruit.

The only British species is *A. maculatum*, CUCKOW-PINT or WAKE-ROBIN, which is abundant in England and most parts of Europe, growing chiefly in moist shady woods and under hedges. It has a tuberous perennial root; its leaves are all radical, on long stalks, strongly arrow-shaped, often spotted; the spathe greenish yellow, enclosing a rather short violet or brownish red spadix. It produces scarlet berries, 1—2 seeded, about the size of peas, clustered upon the spadix. The root has a burning acrid taste, which however, it loses in drying or boiling. In a fresh state, it is a drastic purgative, too violent for medicinal use; and, indeed, it, as well as the leaves, is an active poison; yet a nourishing farina is prepared from it, after the acrid juice has been removed. This farina, is a pure starch, and is known in England by the name of Portland Sago or Portland Arrow-root. It was formerly prepared to a considerable extent in the isle of Portland, where also the tubers (corms) themselves are eaten by the country-people. A cosmetic, called Cypress Powder, is made from them in France, and they are used in Switzerland as a substitute for soap. They contain, indeed, a quantity of *Saponine*, to which their acridity is supposed to be owing. They lose great part of their acridity in drying and were formerly used in medicine as a stimulant in impaired digestion, a diuretic in dropsies, and an expectorant in chest complaints. The plant is extensively cultivated in India for food—*A. Indicum* is also much cultivated in Bengal for its esculent stems and small pendulous tubers.—Acridity in the juice, and the presence of an amylaceous substance of very nutritious quality, from which the acrid juice is easily separated, are characteristics of many plants of this order, particularly species of *Caladium* and *Colocasia*, much used for food in warm countries, under the names COCCO (q. v.), EDDOES, &c.—*Amorphophallus campanulatus* (*A. campanulatum*), called OL by the Bengalese, is very much cultivated in some parts of India for its roots (flat underground corms), which form a very important article of food; yet in a fresh state it is so acrid that it is employed as an external stimulant, and is also used as an emmenagogue. Other species of *Amorphophallus* are still more powerfully stimulant.—Two large species of *Arisæma*, another genus very closely allied to *A.*, were found by Dr. Hooker to afford food to the inhabitants of the Sikkim Himalaya at an elevation of upwards of 10,000 feet. Their tuberous roots are bruised by means of wooden pestles, and thrown into small pits with water, until the commencement of acetous fermentation, when the acridity is mostly dissipated; but the process is so imperfect that cases of injury from the poisonous juice are frequent. The tubers of *Arisæma atrorubens* (*A. triphyllum* of Linnæus), a native of the United States, and there known as Dragon-root and Indian Turnip, yield a pure white starch like that of *A. maculatum*. Their medicinal uses are also similar; they are employed as a stimulant of the secretions.—The DRAGON-PLANT, *A. Dracunculus*, a native of the south of Europe, is not uncommon in gardens in Britain, although it has a carrion-like smell, and its emanations are apt to produce headache and other disagreeable effects. It has a singular appearance—straight stalks, three feet high, curiously spotted like the belly of a snake.—The peculiar acridity of the *Araceæ* is most remarkably displayed in the DUMB CANE (q.v.).

A'RUN, a river rising in St. Leonard's Forest in the middle of North Sussex, and after a course of 35 miles, falling into the English channel. A canal unites it with the Wey, a feeder of the Thames.

A'RUNDEL, a small town 5 miles inland from the mouth of the Arun, in a tertiary and chalk district, on the south side of the South Downs, in the S. W. of Sussex. It consists mainly of a very steep street rising from the right bank of the Arun to the summit of a hill crowned by a castle. The Arun is navigable for vessels of 150 tons up to the town. Bark and timber are the chief exports. Pop. in 1871, 2956. A was disfranchized by the Reform Bill of 1867. It is governed by a mayor, four aldermen, and twelve councillors. The castle, from its site, is a striking object, and was built soon after the Norman conquest. It is an oblong, including 5½ acres within its walls. It was laid in ruins during the civil wars of Charles I., but, being the baronial residence of the Dukes of Norfolk, the late duke restored it to its former Gothic magnificence. The keep, containing the dungeon, is a circular Norman tower of imposing strength.

A'RUNDEL MARBLES, part of a collection of ancient sculptures, formed about the beginning of the 17th c. by Thomas Howard, Earl of Arundel, and presented in 1667 to the university of Oxford, by his grandson, Henry Howard, afterward Duke of Norfolk. The principal portion of it is the 'Parian Chronicle,' consisting of the fragments of an inscription in marble, supposed to have been executed in the island of Paros, about 263 B.C. In its perfect state, this inscription contained a chronological table of the principal events in Grecian history from the time of Cecrops (1582 B.C.) to the archonship of Diognetus (264 B.C.). The chronicle of the last ninety years is lost, and the extant portion of the inscription is much corroded and defaced. This curious and interesting monument, the authenticity of which has been questioned and vindicated with almost equal ingenuity and learning, was purchased for the Earl of Arundel, along with many other relics of antiquity, at Smyrna, by Mr. (afterwards Sir William) Petty. The inscription, and all the other principal sculptures in the Oxford Collection, are to be found fully illustrated in the relative publications of Selden, Prideaux, Maittaire, and Chandler, under the various titles of *Marmora*, *Arundelliana* and *M. Oxoniensia*.

The nobleman whose name is associated with these ancient marbles is worthy of remembrance, independently of his general merits, as the first of his order in England who liberally encouraged the fine arts, and communicated the influence of his own taste and enthusiasm in their cultivation to a wide circle of imitators and successors. Among the scholars and artists on whom his liberal patronage was specially bestowed, were Francis Junius the Younger (his librarian), and Oughtred the mathematician, Wenceslaus Hollar the engraver, whom he brought over to England, Vandyck and Inigo Jones, and the sculptors Stone, Le Sœur, and Fanelli. His collection of works of art, for the supply of which, from the treasures of antiquity, he engaged the service of two distinguished men of letters, Evelyn and Petty, rivalled the galleries of princes. After his death, it was unfortunately dispersed, and many of its choicest treasures were for ever lost sight of. His collection of sculpture alone, when entire, numbered 37 statues, 128

busts, and 250 inscribed marbles, besides altars, sarcophagi, fragments, and gems.

A'RUNDEL, Thomas, Archbishop of Canterbury in the reigns of Richard II., Henry IV., and Henry V., born in 1353, was the second son of Robert Fitz-Alan, Earl of Arundel and Warren. He was first Archdeacon of Taunton, and at the early age of twenty-one, he was, by the pope's appointment, consecrated Bishop of Ely. In 1388, he was, by the same authority, transferred to the archiepiscopal see of York. He was also for some years Lord High Chancellor of England. Having been banished from the kingdom for taking a leading part in the first attempt which was made to deliver the nation from the oppression of Richard II., he was honorably received at Rome, and by Pope Boniface IX. nominated Archbishop of St. Andrews, with a promise of future preferment in England. In 1396 he was enthroned, with great pomp, as Archbishop of Canterbury. He was a bitter persecutor of the Lollards and followers of Wickliffe, and a chief instrument for procuring the horrible act for the burning of heretics (*De Heretico Comburendo*), passed in the reign of Henry IV. He even carried his bigotry so far as to solicit from the pope a bull for digging up Wickliffe's bones, which, however, was wisely refused him. He also procured a synodal constitution, which forbade the translation of the Scriptures into the vulgar tongue. Amongst others whom he caused to be convicted of heresy, and sentenced to the flames, was Lord Cobham, one of the principal patrons of the new sect, at the commencement of the reign of Henry V. Soon after, A. was seized with an inflammation in the throat, which proved fatal. He died 20th February, 1413.

ARVI'COLA. See Vole.

A'RYAN RACE, A'RYAN LANGUAGES. The name Aryan (less properly, Arian) Race or Aryan Family of Nations is now generally used to designate that ethnological division of mankind otherwise called Indo-European or Indo-Germanic. It consists of two branches, geographically separated, an eastern and a western. The western branch comprehends the inhabitants of Europe, with the exception of the Turks, the Magyars of Hungary, and the Finns of Lapland (see Europe); the eastern comprehends the inhabitants of Armenia, of Persia, of Afghanistan, and of Northern Hindustan (see Hindustan). The evidence on which a family relation has been established among these nations is that of language. Between Sanscrit (the mother of the modern Hindu dialects of Hindustan), Zend (the language of the ancient Persians), Greek (which is yet the language of Greece), Latin (the language of the Romans, and the mother of the modern Romanic languages, i. e., Italian, French, Spanish, Portuguese, Wallachian), Celtic (once the language of great part of Europe, now confined to Wales and parts of France, Ireland and Scotland), Gothic (which may be taken as the ancient type of the Teutonic or Germanic languages—including English—and of the Scandinavian), and Slavonic (spoken in a variety of dialects all over European Russia and a great part of Austria), the researches of philology have within the present century established such affinities as can be accounted for only by supposing that the nations speaking them had a common origin.

No one of these nations, whether existing or historical, can claim to be the parent nation of which the others are colonies. The relation among the languages mentioned is that of sisters—daughters of one mother, which perished, as it were, in giving them birth. No monuments of this mother-language have been preserved, nor have we any history or even tradition of the nation that spoke it. That such a people existed and spoke such a tongue is an inference of comparative philology, the process of reasoning being analogous to that followed in the kindred science of geology. The geologist, interpreting the inscriptions written by the finger of Nature herself upon the rock-tablets of the earth's strata, carries us back myriads of ages before man appeared on the scene at all, and enables us to be present, as it were, at creation itself, and see one formation laid above another, and one plant or animal succeed another. Now languages are to the ethnologist what strata are in geology; dead languages have been well called his fossils and petrifactions. By skilful interpretation of their indications, aided by the light of all other available monuments, he is able to spell out, with more or less probability, the ethnical records of the past, and thus obtain a glimpse here and there into the gray cloud that rests over the dawn of the ages.

When these linguistic monuments are consulted as to the primitive seat of the Aryan nations, they point, as almost all ethnologists are agreed, to Central Asia, somewhere probably east of the Caspian, and north of the Hindu Kush and Paropamisan Mountains. There, at a period long anterior to all European history—while Europe was perhaps only a jungle, or, if inhabited at all, inhabited by tribes akin to the Finns, or perhaps to the American Indians—dwelt that mother-nation of which we have spoken. From this center, in obedience to a law of movement which has continued to act through all history, successive migrations took place towards the north-west. The first swarm formed the Celts, who seem at one time to have occupied a great part of Europe; at a considerably later epoch came the ancestors of the Italians, the Greeks, and the Teutonic peoples. All these would seem to have made their way to their new settlements through Persia and Asia Minor, crossing into Europe by the Hellespont, and partly, perhaps, between the Caspian and the Black Sea. The stream that formed the Slavonic nations is thought to have taken the route by the north of the Caspian. At a period subsequent to the last north-western migration, the remnant of the primitive stock would seem to have broken up; part poured southwards through the passes of the Himalaya and Hindu Kush into the Punjab, and became the dominant race in the valley of the Ganges; while the rest settled in Persia, and became the Medes and Persians of history.

It is from these eastern members that the whole family takes its name. In the most ancient Sanscrit writings (the Veda), the Hindus style themselves Aryans; and the name is preserved in the classic Arii, a tribe of ancient Persia, Aria, the modern Herat, and Ariana, the name of a district, comprehending the greater part of ancient Persia, and extended by some so as to embrace Bactriana. Ariana, or Airyana, is evidently an old Persian word, preserved in the modern native name of Persia, Airan or Iran. *Arya*, in Sanscrit, signifies 'excellent,' 'honorable,' being allied probably to the Greek *ari* (stos), the best. Others connect it with the root *ar* (Lat. *arare*, to plough), as if to distinguish a people who were tillers (*earers*) of the earth from the purely nomadic Turanians or Turks.

The several members of this ethnological group will receive special notice each in its place. As to the hypothetical mother-nation—the primitive Aryan stock before separation, it might seem impossible to affirm anything beyond its mere existence and locality. But the ethnologist does not content himself with this. In an admirable essay on *Comparative Mythology* (Oxford Essays, 1856), Professor Max Müller has drawn a picture of the Aryan family while yet one and undivided, in which the state of thought, language, religion, and civilization is exhibited in a multitude of details. Where the same name for an object or notion is found used by the widely spread members of the family, it is justly inferred that that object or notion must have been familiar to them while yet resident together in the paternal home. It is in this way established, that among the primitive Aryans not only were the natural and primary family relations of father, mother, son, daughter, hallowed, but even the more conventional affinities of father-in-law, mother-in-law, sister-in-law; that to the organized family life there was superadded a state organization with rulers or kings; that the ox and the cow constituted the chief riches and means of subsistence; and that houses and towns were built.

One general observation made by Müller is so interesting that we take the liberty of quoting it entire. 'It should be observed,' he says, 'that most of the terms connected with chase and warfare differ in each of the Aryan dialects, while words connected with more peaceful occupations belong generally to the common heirloom of the Aryan language. The proper appreciation of this fact in its general bearing will show how a similar remark made by Niebuhr, with regard to Greek and Latin, requires a very different explanation from that which that great scholar, from his more restricted point of view, was able to give it. It will show that all the Aryan nations had led a long life of peace before they separated, and that their language acquired individuality and nationality as each colony started in search of new homes—new generations forming new terms connected with the warlike and adventurous life of their onward migrations. Hence it is that not only Greek and Latin, but all Aryan languages have their peaceful words in common; and hence it is that they all differ so strangely in their warlike expressions. Thus the domestic animals are generally known by the same name in England and in India, while the wild beasts have different names, even in Greek and Latin.'

In this mainly pastoral life, the more important of the primitive arts were known and exercised: fields were tilled; grain was raised and ground into meal; food was cooked and baked; cloth was woven and sewed into garments; and the use of the metals, even of iron, was known. The numbers as far as a hundred had been named, the decimal principle being followed. The name for a thousand had not come into requisition until after the dispersion, for it differs in different Aryan tongues.

Finally, it was among the yet undivided Aryans, while abstract language did not yet exist, while every word was a metaphor, and the setting of the sun, for example, could only be expressed by his growing old and dying, that those stories of gods, heroes, and monsters originated, which, with more or less of variety, but still with a family-likeness, formed the pagan mythology of every member of the group.

AS was the designation both of a Roman weight (called also *libra*) corresponding very nearly to an English *pound* (q. v.), and also of a coin made of the mixed metal *aes*, or bronze. The As

(coin) originally no doubt weighed a (Roman) pound; but it was gradually reduced to $\frac{1}{96}$ of a pound, and even lower. It is thus difficult to assign any fixed value to the *As*. About 270 B.C., the denarius (=8½d.) contained 10 ases; so that the value of the As was then a little more than 3 farthings; when 16 ases went to the denarius, the value was about a halfpenny. It was by the *sestertius* (q. v.) that money was reckoned at Rome. The oldest form of As usually bore the figure of an ox, a sheep, or other domestic animal (*pecus*); from which it is usually supposed that the Latin word for money, *pecunia*, is derived.

As.

ARZIGNA'NO, a town of North Italy, 11 miles west-by-south from Vicenza, in a plain surrounded by hills. It manufactures woollens, leather, and silk twist. Pop. (1871) 2706.

A'SA, son of Abijah, and grandson of Rehoboam, was the third king of Judah. At the beginning of his reign, he was very young, and his character apparently undeveloped, for he allowed his grandmother, Maachah, to encourage idolatry; but on assuming the reins of government, one of his earliest acts was to remove her from all authority 'because she had made an idol in a grove' (1 Kings, xv. 13; 2 Chron. xv. 16). His zealous efforts to extirpate the vices and impieties of the people were on a whole successful. He took away the Sodomites out of the land, and the altars of the strange gods, broke the images, and cut down the groves. For the next ten years, he devoted himself to strengthening the defences of his kingdom, and organized a magnificent army of more than half a million, which seems to have been looked upon as a menace by other monarchs, for one of these, Zerah the Cushite, took the initiative, and penetrating through *Arabia Petræa*, invaded Judah, but was defeated with immense slaughter.

Before the battle commenced, Asa had invoked the aid of Jehovah: and some time after the victory, he and all his people entered into a solemn covenant 'to seek the Lord God of their fathers with all their heart and with all their soul' (2 Chron. xv. 12). Peace lasted for twenty years in the kingdom, but in the 35th year of Asa's reign, war again broke out between him and Baasha, king of Israel. He sought and obtained the aid of the Syrian monarch, Benhadad, but at the expense of 'the treasures of the house of the Lord;' and although successful against his adversary, he was indignantly upbraided and threatened by the prophet Hanani for not relying on Jehovah alone. Asa, flushed with success, threw the prophet into prison, and, it would appear, 'in his rage' oppressed some of the people at the same time—perhaps those only who sided with Hanani, for we know that at his death the nation honored him with a splendid funeral; and the sacred historian pays the highest tribute to his memory, declaring that Asa's heart was perfect with the Lord all his days.' He reigned from 955 to 914 B.C.

A'SA DULCIS (i. e., Sweet Asa), a drug in high repute among the ancients as an antispasmodic, deobstruent, and diuretic; also for supposed virtues of the most extraordinary kind, such as neutralizing the effects of poison, curing envenomed wounds, restoring sight to the blind, youth to the aged, &c. Its value was estimated by its weight in gold. The princess of Cyrene caused a figure of the plant producing it to be struck on the reverse of their coins, and it was sometimes called *Laser Cyrenaicum*. The plant is of the genus *Thapsia* (of the natural order *Umbelliferæ*), either *T. Garganica*, or a nearly allied species *T. Silphium*—perhaps the drug was produced by both. They are natives of the south of Europe and of Barbary, and appear to be very active purgatives.

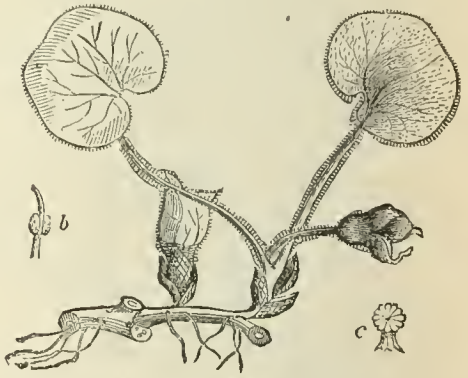
ASAFŒ'TIDA, or ASSAFŒTIDA (i. e., Fetid Asa or Assa), is a gum-resin, which has been supposed to be identical with the exuded juice of the *Silphion* of Dioscorides, so highly esteemed among the Greek physicians; but which, perhaps, was rather the *Asa dulcis*. Its name is derived from the Persian word *asa*, which means *a staff*. This drug is brought from Persia and Afghanistan, and is procured by drying the milky juice which flows from the root of the plant *Ferula* (*Narthex*) *A.*, which has been referred to the genus *Ferula* by Linnæus, and to *Narthex* by Dr. Falconer. The root of the A. plant is long, and generally undivided; white inside, but having a black covering; and contains in its interior a quantity of juice of an overpowering odor, which much resembles that of garlic. *Ferula* or *Narthex A.* has its radical leaves tripartite, their segments bipinnatifid, and nearly two feet in length. The gum-resin is said by some to be obtained also from *Ferula Persica*, a plant which has the root-leaves very much divided, and all either tripinnate or quadripinnate. The name *ferula*, like the Persian *asa*, refers to the appearance of the stem of the plant. *Ferula Persica* has long been propagated successfully in Britain, and even brings its seeds to perfection.

A. is prepared in the dry southern provinces of Persia, but chiefly in Khorassan and Afghanistan, and also to the north of the Hindu Kush range of mountains. About April, the root-leaves are taken away, and the root itself is more or less exposed by removal of the soil from about it. After a lapse of six weeks, a slice is cut horizontally from its summit, and a thick white juice exudes, the smell of which even exceeds in strength that of the drug when dry. The drug is sometimes met with in the market in the form of tears, but more frequently in lumps, which are made up of irregularly-shaped tears, agglutinated together by a softer substance. A. is extensively used in medicine and possesses stimulant and anti-spasmodic properties. When taken internally, it undergoes absorption, and may be detected in almost every secretion of the body, as the saliva, breath, and urine. According to the analysis of Pelletier, A. is composed of the following substances: resin, 65 parts; volatile oil, 3·6; gum, 19·44; bassorin, 11·66; various salts, ·30. In many parts of the East, this drug is used as a condiment, in which respect it seems to take the place of the garlic of some European nations.

A'SAPH, St., a cathedral city and a station on the Vale of Clwyd Railway, stands on a small hill between the rivers Clwyd and Elwy, in the north-west of Flintshire, Wales. The cathedral is a cruciform building, 178 by 68 feet, and was built in 1284 on the site of a wooden structure founded before 596. It has a tower 93 feet high, is one of the smallest of British cathedrals, and stands on the top of the hill on which the city is built. Kentigern, or St. Mungo, Bishop of Glasgow, and his disciple, St. A., are said to have founded the see of St. A. in the 6th c. The bishop, who has a revenue of £4,200, is patron of 121 of the 148 benefices in the diocese. Pop. in 1871, 1900. St. A., with the Flint district of boroughs, returns one member to parliament.

A'SAPHUS. See TRILOBITE.

ASARABA'CCA (*A'sarum Europæum*), a plant of the natural order *Aristolochiaceæ* (see ARISTOLOCHIA), a native of Europe, growing in woods; rare, and perhaps not truly indigenous, in Britain. The whole plant has acrid properties; the roots and leaves are aromatic, purgative, and emetic. The use of A., however, as an emetic has been much superseded by that of ipecacuanha, which is milder and safer. The powdered roots and leaves enter into the composition of cephalic snuffs, which cause sneezing, and are employed as a counter-irritant in cases of headache, ophthalmia, toothache, &c. The plant contains a volatile oil, and a crystalline substance called *Asarine*, to which it seems to owe its active properties. The genus *Asarum* is distinguished by twelve horned stamens, distinct from each other and from the style, and by a bell-shaped three-lobed perianth. *A. Europæum* has a very short stem with two shining kidney-shaped leaves on long stalks, from the axil of which springs a single drooping greenish-brown flower.—A nearly allied species, *A. Canadense*, a native of Canada, is stimulant and diaphoretic, and is used under the name of CANADA SNAKEROOT, instead of *Aristolochia Serpentaria*. It is also called WILD GINGER, and used as a spice, being of a warm aromatic quality, and not acrid, like its European congener.



Asarabacca (*Asarum Europæum*).
b, detached anther; *c*, style.

ASB'EN, or A'IR, a country of Central Africa, situated in 15° —20° N. lat., and 6°—11° E. long. Pop. estimated at 64,000. Its territory comprises a large amount of desert, as well as considerable tracts of mountain land. The inhabitants are chiefly of Berber extraction, and generally profess the religion of Mohammed. They are of a degraded character, and given to marauding. The climate is rather healthy, and generally hot and dry. The rainy season is from August till October. The soil in many places is

fertile, producing the doom palm, dates, and senna. Dr. Barth, the traveler, says of the aspect of the country: 'Rocky ground, overtopped by higher mountain masses or by detached peaks, and hollows overgrown with rich vegetation, and preserving for a longer or shorter time the regular form of valleys, succeed each other by turns, and constitute the predominant feature of the country of Asben.' The capital is Agades (q. v.).

ASBE'STOS, a mineral very closely allied to tremolite, actinolite, and hornblende, and which, along with tremolite and actinolite, is often ranked among the varieties of hornblende. It consists chiefly of silica, magnesia, lime, and oxide of iron, and is of a fine fibrous character, the fibres sometimes combined together in a compact mass, sometimes easily separable, elastic and flexible. It is generally of a whitish or greenish color. The variety called *Rock-cork* very much resembles cork, is soft and easily cut, and so light as to swim in water. *Rock-leather* and *Rock-wood* are varieties somewhat similar to rock-cork, but not so light. The finest fibrous variety with easily separable fibres is called *Amianthus* (from a Greek word signifying *unpollutible*, as A. is from a Greek word signifying *indestructible*), because cloth made of it was cleansed by passing it through fire. This cloth was used by the ancients to enwrap dead bodies placed on the funeral pile, so as to preserve the ashes of the body unmixed. Amianthus has sometimes been used for the wicks of lamps, and is often employed to fill vinaigrettes, being moistened from time to time with a few drops of aromatic vinegar. The finest amianthus is found in the Tarentaise in Savoy. It is particularly abundant in Corsica. It is found also in Cornwall, at Portsoy in Scotland, and in several of the Shetland Islands. The main supply came, till of late, from the older crystalline rocks of the Alps and Pyrenees, from North America and Silesia. Of late, much comes from Tasmania, and great quantities of a valuable kind have been obtained in New South Wales. A. is now applied to many purposes. A novel use for A. is for making non-conducting gloves for electricians. Minerals which resemble A. in their fibrous character are sometimes called *asbestous* or *arbestiform*, and some are believed to be varieties of augite rather than of hornblende.

A'SCALON, or A'SHKELON, a ruined city of Palestine, on the shore of the Mediterranean, 36 miles W.S.W. of Jerusalem. Its name often occurs in the Old Testament. It was in ancient times a fortified city, and the principal town of one of the five lordships of the Philistines. Herod the Great embellished it with baths, palaces, and fountains; but it suffered in the wars with the Romans. There was a celebrated temple of Derketo, the Venus of the Syrians, at A. After continuing long under the dominion of the Roman empire, the city came into the possession of the Saracens in the 7th c. In 1099 a great battle was fought on the plains of A., between the Crusaders and Saracens, when the Christians gained a decisive victory. The city, however, a number of years after, was recaptured by the Moslems, and held by them as a strongly fortified place until 1153, when it was taken by the Crusaders under Baldwin III. In 1187 it was retaken by the Saracens, but afterwards (1192) fell into the hands of Richard Cœur de Lion. Subsequently, being more than once dismantled and repaired during the wars between Richard and Saladin, it was reduced to desolation by Sultan Bibars in 1270.

The ruins of this ancient city occupy an extensive semicircular eminence, sloping gently to the east, but abrupt and steep towards the sea. Part of the walls are still standing, with the remains of Gothic churches, a palace, and several edifices of more ancient date, which attract the notice of the traveler and the antiquary.

A'SCARIS, a genus of *Entozoa*, or intestinal worms of the order *Nematoidea* of Cuvier and others. The ascarides have a body approaching to cylindrical, but thickest in the middle. They inhabit the intestines of animals. The species are numerous. One of the best known is *A. lumbricoides*, often called the common round worm, which occurs in the intestines of man and of some of the lower animals, as the hog, ox, horse, &c., and which often occasions severe disease, and sometimes death, particularly when it ascends from the intestines to the stomach.

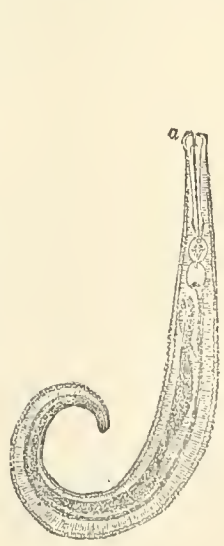
Its presence even in its most ordinary situation in the small intestines, is attended with unfavorable effects upon the general health; and the greater the number present—which, however, is not usually large—the greater, of course, is the injury; although when they remain in the intestines, worms of this species are less injurious and less annoying than other, and even much smaller intestinal worms. In subjects otherwise diseased, they occasionally find their way out of the intestines into the closed serous cavities of the body, and even pass through ulcerated parts of the external integument; but the mouth is formed only for suction, and is provided with no means of boring through the healthy intestine. An immense number of remedies (anthelmintics or vermifuges) have been proposed and used in order to expel this parasite, some of which are very effectual. They do not in general kill the worms, but act by making their dwelling-place disagreeable to them (see VERMIFUGE). It is, however, remarked by Küchenmeister, in his work on Parasites, that the treatment of cases of this description is as yet purely empirical, because, although there must be a condition of the intestinal canal which favors the thriving of worms, we are by no means certain what it is.

Ascaris lumbricoides (male).
One-third of the true linear dimensions; *a* is the head of the worm

The *A. lumbricoides* is ordinarily, in size and appearance, pretty much like the Common Earthworm (*Lumbricus terrestris*), from which resemblance it has received its specific name, although the resemblance is rather in general form than in more essential characteristics. It has been seen fifteen inches in length. Its mouth consists of three fleshy tubercles, which can be spread out upon the intestine to form a broad circular sucker, and within which there is a small tube capable of being protruded. The alimentary canal consists of a muscular gullet and stomach, and a thin-walled intestine. Between the muscular layers of the body is produced a pale reddish oily matter, with a strong and very peculiar odor, which is gradually communicated to spirit in which the worm is preserved. The males are smaller than the females, and much more rare. The females produce eggs in great numbers; but it is uncertain if they are developed within the intestine in which the parent worm resides. They are certainly capable of being developed elsewhere, and probably the young enter the intestines of the animals of which they are eventually to be the parasites, after having spent a certain stage of their existence in very different circumstances; the worm in a very young state having never been found in the intestines of man or of quadrupeds, the situation of its perfect development. The inhabitants of damp valleys are believed to suffer more than others from the *A. lumbricoides*. It is said also to be particularly frequent in persons who are much accustomed to eat raw leaves and roots; and it has been supposed that the young may exist, perhaps in an encysted state, in the bodies of insects or other very small animals which are accidentally eaten along with such food, as the young tapeworm finds its way into the human intestines from its residence as a creature of very different size and form in the flesh of the sheep or the pig. The once prevalent idea of the equivocal generation of these worms is now completely abandoned.

The mouth of Ascaris lumbricoides, magnified.
Showing the fleshy tubercles spread out, with cockscombe-like muscles interior to them, and the entrance to the intestinal canal.

A vermicularis is another species usually referred to this genus,



Ascaris vermicularis (male).
Magnified twenty-five diameters: *a*, the mouth.

Ascaris vermicularis (female).
Magnified eight diameters.

and is the only other species troublesome to mankind. It is known as the Thread-worm or Maw-worm, and is very common both in children and adults. It infests chiefly the lower part of the intestines, and particularly the rectum, great numbers being often

present together, and occasioning intolerable itching, irritation, and loss of sleep, although there is not in general much serious injury to health. The same anthelmintics employed against other intestinal worms are found efficacious also in the expulsion of this; and clysters are often employed with great success. The Thread-worm is white not more than half an inch in length, the male much less. Some recent authors of high reputation have separated this species from A, and call it *Oxyuris vermicularis* but the term *Ascarides* is often employed in medical works with exclusive reference to it; and indeed this name, derived from the Greek *askarizo* to jump or move briskly, probably owes its origin to the liveliness of motion which this species exhibits. It has been recently, discovered that its nervous system is very highly developed, consisting of many ganglia, with connecting and ramifying cords.

ASCE'NSION, one of the comparatively few single islands on the globe, being about 800 miles to the north-west of St. Helena, and almost as far to the south south-west of St. Matthew. It is said to have received its name from the circumstance of its having been discovered by a Spanish navigator on Ascension-day. It is nearly in the middle of the South Atlantic, the lat. of its fort being 7° 55′ 55″ S., and its long. 14° 25′ 5″ W. A. is 8 miles long by 6 broad; its area being about 35 square miles. Though it was discovered as early as 1501, yet it remained uninhabited till 1815, when, in connection with Napoleon Bonaparte's detention in St. Helena, the English took possession of it. It is now used as a naval victualling-station and hospital. Pop. (census of 1871) 27, 15 being residents on the island, and 12 being in the Royal Naval Hospital. Like St. Helena, it is of volcanic origin, and generally mountainous—one peak rising to a height of 2870 feet. From the extreme dryness of the climate, which, however, is healthy, the surface is nearly destitute of verdure. Among indigenous productions are the tomato, caster-oil plant, and pepper; European vegetables are cultivated. See Mrs. Gill's *six months in A.* (1879).

ASCE'NSION, RIGHT (Lat. *ascensio*, a rising; Ger. *gerade aufsteigung*), the name given in astronomy to one of the arcs which determine the position relatively to the equator of a heavenly body on the celestial sphere, the other being the declination. See ARMILLARY SPHERE. It is the arc of the equator intercepted between the first point of Aries (q. v.), and the point at which the circle of declination passing through the star cuts the equator. Measured always from west to east, right A. on the heavens corresponds to longitude on the earth. The right A. of a heavenly body is ascertained by means of the transit instrument and clock. The transit instrument determines its meridian passage, and the transit clock gives the time at which this takes place. When the first point of Aries is in the meridian, the clock stands at 0 hours, 0 minutes, 0 seconds, and it is so arranged as to indicate 24 sidereal hours, the time that elapses between two successive passages of that point. The reading of the clock, therefore, at the passage of any heavenly body gives its right A. in time, and this, when multiplied by 15, gives the same in degrees, minutes, and seconds. The right A. is usually given, however, in time. The old term, *oblique* A., was given to the right A. of the point of the equator that rose simultaneously with the heavenly body; and the difference of the oblique and right A. was called the 'ascensional difference.'

ASCE'NSION-DAY, or HOLY THURSDAY, one of the great religious festivals of the Episcopal, and also of the Roman Catholic Church. It is held on the fortieth day after Easter, and is intended to commemorate the ascension of Christ into heaven. It is one of the six days occurring in the year for which the Church of England appoints special psalms, and the same church also particularly recommends it as a fitting day for the receiving of the communion. Ascension-day has been observed from the earliest times of the Christian Church. St. Augustine believes it to have been instituted either by the apostles themselves, or the primitive bishops succeeding them. Connected with the religious observances of this day were certain civic ones, which in some parts of England and Scotland are continued to this day—viz., *beating the bounds, or riding the marches*, though their religious connection is apparently forgotten. See ROGATION DAYS and PERAMBULATION.

ASCE'TICISM. Among the Greeks, *askesis* denoted the exercise and discipline practised by the athletes or wrestlers, who had to harden their bodies by exertion and to avoid all sensual and effeminating indulgences. In the schools of the philosophers, especially of the Stoics, the same word signified the practice of mastering the desires and passions, or of severe virtue. In these senses it passed into the language of the early Christians. The language of St. Paul in comparing the Christians to wrestlers who had to contend with Satan, the world, and the flesh, contributed to this. But the philosophy of the time had more to do with it, which held the freeing of mind from matter to be the means of union with God; or, at least, that the refraining from all luxurious pleasure was the way to restore the soul to its original purity. To understand the vast influence that ascetic ideas have exercised on the Christian religion, we must look beyond the bounds of its history. Their root lies in the oriental notion, that the Absolute or All is the only real existence; and that individual phenomena, especially matter in all its shapes, are really nothing, and are to be despised and avoided, as involving the principle of separation from the Absolute. The East, accordingly, is the native soil of A. The glowing imagination of the oriental carries the practice of it to a monstrous extravagance, as is seen in the frightful self-tortures inflicted by the yogins (see YOGA) and fakirs (see FAKIR), the suicides in the sacred Ganges and otherwise, and the practices recently prevalent of offering children in sacrifice, and of burning widows; most of which, however, have been humanely suppressed by the efforts of the British government. Buddhism, which may be considered as a kind of puritan revival or reformation—the methodism of the Indian religion—carried the principle beyond its previous bounds. In its contemning the world; in its inculcating a life of solitude and beggary, mortification of the body, and abstinence from all uncleanness and from all exciting drinks, the object was to keep as distant and detached as possible from this 'Vale of Sorrow' (see BUDDHISM and NIRVANA). The sober Chinese, and the more moral and rational Persians, never carried asceticism to these extravagances; and the earnest Egyptians sought to confine it to monogamy of the priests, abstaining from the flesh of swine and from beans, rigid purity, circumcision, moderate flagellation, and frequent contemplation of death (which there were arrangements for bringing to remembrance, even in the midst of festivities). These are certain milder forms of A., but the principle is the same.

It is in the light of this fore-history that we must consider Judaic and Christian asceticism. In the oriental mind, especially in Egypt, circumcision, avoiding all uncleanness, and fasting, were signs of humiliation before God; and in the Mosaic ritual they were conditions of the favor of the holy Jehovah. Voluntary vows, abstaining even from lawful food, wine, &c., were held to have a special purifying, consecrating efficacy, particularly for prophets and men of special callings. But self-castigation continued for long foreign to the sobriety of Judaism, and even hermitism came into established practice only shortly before Christ, in Palestine among the Essenes (q. v.); in Egypt among the Therapeutæ (q. v.); though doubtless Jewish A. had become more stern and gloomy since the exile in Babylon.

A. was far less congenial to the reflective nations of the West, above all to the cheerful Greeks. A Greek felt himself entitled to enjoyment as well as his gods; hence Greek religious festivals were pervaded by cheerfulness. The only exception appears to be the Eleusinian mysteries, which never took hold of the people generally, and the passing phenomenon of the Pythagorean fraternity. The attack made by the Socratic school upon the body as the prison of the soul—a view reminding one of the East—and the extravagant contempt for the elegances, and even decencies of life, professed by the later Stoics and Cynics, were no genuine fruits of the popular Greek mind; and we must also ascribe to the infusion of oriental philosophy the ascetic tendencies of Neoplatonism, in holding abstinence from flesh and from marriage as chief conditions of absorption into the divinity.

It was into the midst of these ideas that Christianity was introduced. The Jewish converts brought with them their convictions about fasting. Fasting and Nazaritic observances were thought sanctifying preparatives for great undertakings; and the inculcation of abstinence from marriage, on the ground of the expected speedy re-appearance of Christ, falls in with the same notion, namely, that the flesh, that is, the sensuous part of our nature, is the seat of sin, and must therefore, before all things, be rigorously chained. The old oriental traditions of A.; the spirituality of Christianity, pointing away from earth to heaven; opposition to the corruption of the heathen world; the distinction made between belief and knowledge, as a higher and lower stage of intelligence, leading to a corresponding distinction of a higher and lower stage of virtue: all combined to make the Christians of the first two centuries hold aloof from the world and its wisdom, and favor abstinence from marriage, more especially on the part of the clergy. This ascetic spirit began as early as the commencement of the 2d c. to court trial in the perilous practice of men and women living together under vows of continence. We find Cyprian dissuading from the dangerous experiment, and even the authority of the church interposed to the same effect. But during the first three centuries no irrevocable vows yet bound the devotees to a life-long A. Fasting was also comparatively rare.

But the tendency to outward manifestations now began to grow stronger. The inward and spiritual life of the Christians had greatly declined; and if the previous bloody persecutions had driven individuals from human society into the deserts, the growing secularization of the church, after Christianity became the state religion, had the same effect to a still greater degree. All this paved the way for the chief manifestation of A.—namely, monasticism, which the church found herself compelled by the over-

whelming tide of opinion within and without to recognize, and to take it under her protection and care. See MONACHISM. From the African Church, represented by Tertullian and Augustine, a spirit of gloomy and crushing supernaturalism spread deeper and deeper over the Western Church generally, intensifying the ascetic tendencies, and leading to still more marked separation from a despised world. There were not wanting healthier minds—as Jovianus, Vigilantius, and others—to raise their voices against fasting, monkery, and the outward works of A. generally; but such protests were vain, and became ever rarer.

From the 11th c., the Cathari, Waldenses, and other sects, though ascetics themselves in a way, yet assailed the external A. of the church; the classic Petrarch fought on the same side; and so did Wickliffe, Huss, and Jerome of Prague, in their premature struggles at Reformation. After a preliminary skirmish by Erasmus, the struggle was decided in the reformation of the 16th c. The fundamental principle of that movement, that salvation is secured by justification through faith, and not through dead works, struck at the root of monkery and mortification in general. But the victory has not been so complete as is often assumed. The ascetic spirit often shows itself still alive under various disguises even in Protestantism. The Mennonites inculcated a rigid A.; and with the Shakers of America, celibacy is practised as a virtue. The essence of A. is to hold self-denial and suffering to be meritorious in the sight of God, in and for itself, without regarding whether it promotes in any way the good of others or the improvement of the individual's own character. In this light, many traits presented by Puritanism, Methodism, and Quakerism appear ascetic. It is not impossible that vegetarianism, total abstinence, and other recent austerities, though advocated on other grounds, recommend themselves to the feelings of many from their falling in with this deep-seated propensity to A.; which seems a relic of that dread of the malignity of the invisible and supernatural powers which haunts the human mind in an unenlightened and savage state.

Even in the Romish Church, ascetic practices have been modified in recent times; fastings are less rigorous, and the self-sacrifice of conventual life is more directed to beneficial ends. Mohammedanism has undergone the same change. In the Greek church, monasticism had always a milder form.

ASCH, a town in the west of Bohemia 100 miles west-north-west from Eger. It has cotton, linen, and woollen manufactures. Pop. (1869) 9405.

ASCH, a town in the west of Bohemia, 100 miles west-north-west from Eger. It has cotton, linen, and woollen manufactures. Pop. (1880) 13,209.

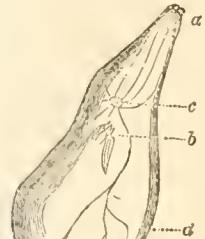
ASCHA'FFENBURG, the chief town on the right bank of the Maine, in the Bavarian district of Unterfranken (lat. 50° 1′ N., long. 9° 7′ E). It is built upon an eminence, and has both a healthy and attractive situation, but the streets are narrow, irregular, and slope steeply towards the river. The castle of Johannisberg, built between 1605—1614, by Johann Schweikhardt, Elector of Mentz, and the favorite hunting residence of many of his successors, forms a quadrangle, with towers at each corner, and overlooks the whole town. Besides the collegiate church, the military barracks, and the town-hospital, A. possesses a Roman villa, built by the late King Louis, in imitation of the Castor and Pollux edifice discovered at Pompeii. It is celebrated for its manufacture of colored papers, besides carrying on a considerable trade in wood, building-stone, tobacco, wine, &c. Pop. (1875) 10,849, principally Catholics. A. existed as early as the invasion of Germany by the Romans, who built a castle here. In 974, Otto I., Duke of Swabia and Bavaria, founded the collegiate church, which greatly increased the prosperity of the place. After Otto's death, it came into the possession of the archbishops of Mentz, and remained with them until the dissolution of the Germanic empire. In 1814, along with the principality of which it is the capital, it was ceded to Bavaria by Austria.

ASCHAM, ROGER, a distinguished English writer and classical scholar, was born in 1515 at Kirby Wiske, in Yorkshire. He received his early education in the family of Sir Anthony Wingfield, and in 1530 entered St. John's College, Cambridge, where he took his degree of M. A. in 1536. The study of the classics, especially Greek, had recently been revived at Cambridge, and the natural bent of A. impelled him with ardor to these studies. His reputation as a classical scholar soon brought him numerous pupils; and there being at that time no Greek chair, he was appointed by the university to read lectures in the public schools. He at first opposed the then new method of pronunciation which is still used in England; but afterwards adopted and defended it. His leisure hours were devoted to music, penmanship, in which he excelled, and archery.

In defence of the latter art, he wrote, in 1544, a treatise entitled *Toxophilus*, the pure English style of which, independently of its other merits, ranks it among the classical pieces of English literature. For this treatise, which was dedicated to Henry VIII., he was rewarded with an annual pension of £10, equivalent to about £100 of our present money. About the same time, he was appointed university orator. In 1548, on the death of his former pupil, Grindal, he was called to supply his place as master of languages to the Lady Elizabeth. In this office he gave the highest satisfaction; but at the end of two years abruptly resigned it, on account of some offence he had taken at some persons in the princess's household. That he did not lose favor at court, however, is manifest, from his having soon after been appointed secretary to Sir Richard Morysine, ambassador to the court of Charles V. He spent three years in Germany, and published an account of his observations in that country. He also made a short tour in Italy. During his absence, he had been appointed Latin secretary to Edward VI. On his return, after the death of the king, the interest of Gardiner, Bishop of Winchester, secured his appointment to the same office under Mary; his pension also was doubled. His prudence and moderation preserved him from offending by his Protestantism. After the death of Mary, Elizabeth retained him at court in the double capacity of secretary and tutor, which he discharged till his death, in 1568. His principal work, *The Schoolmaster*, a treatise on classical education, was published in 1571 by his widow. His Latin letters and poems have been frequently reprinted. The best edition of the former is that of Elstob (Oxford, 1703). To an edition of his English works, by the Rev. J. Bennet (1767), is prefixed a life by Dr. Johnson.—ASCHAM, a case for the reception of the bow, arrows, strings, and other accoutrements of the archer, derives its name from the author of the *Toxophilus*.

ASCHERSLE'BEN, a town in the district of Magdeburg, in the province of Prussian Saxony, lat. 51° 46′ N., long. 11° 27′ E. It is situated on the river Eine, is 32 miles distant from Magdeburg, and has a pop. of (1875) 17,532. The inhabitants are chiefly occupied in agriculture and gardening, but its trade is not very important. It has, however, considerable manufactures of woollens, linens, earthenware, &c. In the vicinity are some ruins erroneously supposed to be those of the old burgh of Ascania, the original seat of the House of Anhalt.

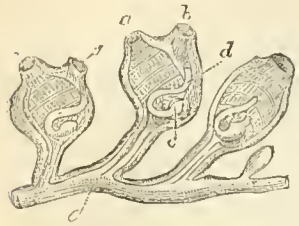
ASCI'DIA, a Linnæan genus of marine mollusca, now much restricted as a genus, but the type of a family called *Ascidiadæ*. The name Ascidians is also commonly employed to designate all those tunicated mollusca which form the order *Saccobranchiata* of Owen, or in which respiration is carried on by means of gill-sacs (*branchial sacs*); and these are divided into Compound and Solitary Ascidians (*Aggregata* and *Solitaria*). The ascidians, along with the other *Tunicata*, are acephalous, or destitute of a head, and are enclosed, not in a shell, but in an elastic tunic with two orifices composed of a substance apparently identical with the *cellulose* of plants, consisting only of carbon and hydrogen. Within the external tunic is a muscular membrane, regarded as corresponding to the *mantle* of other mollusca, and the openings of which agree with those of the tunic. The greater part of the cavity of the mantle forms a branchial sac, the lining of which, folded in various ways, constitutes the gills (*branchiæ*); and into it currents of sea-water are continually brought by the respiratory movements, passing out through the vent or anal orifice. Multitudinous *cilia* in the mouth and branchial sac, cause by their action this continual flow of water. The motion of the cilia is apparently quite involuntary. By this flow of water, the particles of food requisite for the animal are brought in, so that the aëration of the blood and the supply of the stomach are carried on together by the same means. The œsophagus or gullet opens from the branchial sac, which is indeed regarded as probably an expansion of the upper part of it—a dilated pharynx. Under the branchial sac is the stomach; and the alimentary canal, which is more or less tortuous, finally returns upon itself, so that the two orifices are not far separate. The liver consists of follicles produced into tubes, and communicating with the stomach by a single opening. There is a heart and a circulation of blood, with the remarkable peculiarity of alternations in its course, the circulation now and then pausing and being reversed. The transparency of many of the ascidians permits these and other internal movements to be easily observed. The nervous system is very simple, consisting of a single ganglion, situated between the mouth and the anal orifice, and which sends out filaments to both of them, and other branches over the surface of the mantle. The mantle is capable of contracting suddenly to eject a jet of water, and along with it any body the presence of which is disagreeable. It also contracts and ejects water, if the animal is touched, and this appears to be the only means of defence which these creatures possess. There is no trace of eyes or of other organs of special sense



Nervous System of Ascidia.

a, mouth; *b*, vent; *c*, ganglion; *d*, the mantle (the external tunic being removed).

The ascidians are found in all seas, and often constitute an important part of the food of fishes. Some of them are occasionally used as human food, as *Cynthia microcosmus* on the shores of the Mediterranean. Many of them are very small, but some attain a size of five or six inches in diameter, and when touched, eject water to a considerable height, the largest of them to about three feet. They are all fixed by the base, in their natural state, to some solid substance, as a rock or seaweed; sometimes by the intervention of a stalk or peduncle. In some kinds (*Social Ascidians*), the peduncles of a number of individuals are connected by a tubular stem, and to some extent they have a common circulation of blood, although each has its own heart, respiratory apparatus, and digestive system; and if a ligature is drawn around the peduncle of one so as to cut it off from the common circulation, circulation takes place in it as in a solitary ascidian. In other kinds (more strictly called *Compound Ascidians*—which designation, however, is by some authors applied to those just described, whilst these are called *Aggregate Ascidians*), the tunics of many are united into a mass, and they form systems like zoophytes. The compound system sometimes bears a general resemblance to an actinia. Very frequently it forms a slimy crust upon algæ, shells, &c., or projects in globular or conical masses, 'more like a lump of inanimate matter than a being endowed with vitality'—'a curious and interesting internal organization, veiled by the coarsest exterior.' The individuals are sometimes connected by a gelatinous flesh, which consists of cellulose, and there is sometimes a calcareous deposition in this connecting substance as in the compound polypes. The individuals in these systems have always sprung by gemmation from one, and both the solitary and compound ascidians propagate by eggs.



Section of Social Ascidian.

a, mouth; *b*, vent; *c*, stomach; *d*, intestinal canal; *e*, common tubular stem.

Ascidian (young).

The young have the power of active locomotion, resemble tadpoles in form, and swim by means of a vibratile tail, which disappears when they settle, being usually detached by contradiction at the base. The sexes are supposed to be distinct only in some of the ascidians. The ovaries are usually large, and the ova are carried away by the stream which passes through the animal. It is in the solitary ascidians that the highest organization is to be observed, and in which alone a distinction of sexes appears. In them, a muscular ring surrounds the mouth, and can be closed to exclude what is unfit to enter. Within this aperture there is also a fringe of tentacula, short and simple, or longer and minutely divided. In the compound ascidians, gemmation does not begin till the single animal has been fully developed; thereafter, bud after bud is produced, according to the plan upon which the compound system is constructed, and the procreative force of the germ-mass finally exhausts itself in the formation of male and female organs, in which that force is again mysteriously renewed under its two forms of the spermatozoon and the germinal vesicle, by the combination of which the reproductive cycle again begins its course.'

The name ASCIDIAN ZOOPHYTES (*Zoophyta Ascidivida*) has been used to designate those zoophytes or polypes which form the class *Polyzoa* of Thompson, *Bryozoa* of Ehrenberg and which in certain features of their organization resemble the A., although in other respects they differ widely from them. The *Alcyonidium* and *Alcyonella*, already noticed in the article *Alcyonium*, belong to this class. See POLYPI and ZOOPHYTE.

ASCLEPIADA'CEÆ, or ASCLEPIA'DEÆ, a natural order of dicotyledonous or exogenous plants, mostly shrubs, often with twining stems, almost always with milky juice. The leaves are entire, and have cilia between their stalks in place of stipules. The flowers are peculiar in their structure, although symmetrical and regular. The calyx is divided into five segments, the corolla into five lobes; there are five stamens and the stigma has five angles. The filaments are usually united so as to form a tube, which is generally furnished with a coronet of peculiar hood-shaped appendages; the anthers are two-celled, the pollen grains cohering in wax-like masses, which fall out of the anther cells, and become attached to glands at the angles of the stigma; there are two ovaries and two styles very close together, and often very short, with one dilated stigma common to both. The fruit consists of two follicles, or, by abortion, of one only, having numerous imbricated seeds with thin albumen, the end of the seeds terminating in long down. There are about one thousand known species, chiefly natives of warm climates. Some of them are cultivated in gardens and hothouses upon account of their curious or beautiful flowers, among the most familiar of which are some of the species of *Asclepias* (q. v.) or Swallow-wort; perhaps none of them is more highly or deservedly esteemed than *Stephanotis floribunda*, the fragrance of which equals its beauty, and which, since its introduction into British hothouses, has been sought for the bridal-garlands of the highest aristocracy. No hothouse climber is better known than *Hoya carnosa*, at each flower of which a drop of honey is always found to hang.

Vincetoxicum officinale.

a, root; *b*, fruit; *c*, single seed.

A number of species are medicinal, as Indian Sarsaparilla (q. v.), (*Hæmidesmus Indicus*); Mudar (q. v.) (*Calotropis gigantea*), so highly prized in the East Indies; *Sarcostemma glaucum*, the Ipecacuanha of Venezuela; *Tylophora asthmatica* and *Secamone emetica*, the roots of which are used as emetics, and in smaller doses as cathartics, and the former of which is reckoned among the most valuable medicinal plants of India; *Cynanchum acutum*, which yields a purgative called Montpelier Scammony, and *Vincetoxicum officinale*, which possesses similar properties. Argel (q. v.), much used for adulterating senna, belongs to this order.—The down of the seeds is sometimes employed as a substitute for silk or cotton (see ASCLEPIAS); and the stems of not a few species afford useful fibres, as those of the *Asclepias Syriaca* (see ASCLEPIAS), the Mudar (q. v.) and other species of *Calotropis*, natives of India and Persia, *Hoya viridiflora*, *Holostemma Rheedianum*, &c. The Mudar or Yercum fibre is very highly extolled by Dr. Royle (*Fibrous plants of India*). The bark of *Marsdenia tenacissima*, a small climbing-plant, yields a fibre called *Jetee*, of which the Rajmahal mountaineers make bowstrings, remarkable for their great elasticity, which they are supposed in some measure to owe to the presence of caoutchouc. The fibre of *M. Roylei* is used in Nepal. *Orthanthera viminea*, which grows at the base of the Himalayas, and has long leafless wandlike stems of ten feet in height, yields a fibre of remarkable length and tenacity, and which is supposed to be peculiarly suited for rope-making. The fibres of *Leptadenia Jacquemontiana* and *Periploca aphyllum* are used in Sinde for making the ropes and bands used in wells as water does not rot them.—The milky juice of most species of A. is acrid, but in some it is bland, and they are used for food, as is the milk itself of the Kiriaghuma or Cow-plant of Ceylon (*Gymnema lactiferum*). A few species, as *Marsdenia tinctoria*, a native of Silhet, yield indigo of excellent quality. The flowers of the genus *Stapelia* have a strong smell of carrion, and flies sometimes lay their eggs upon them, as it were by mistake.—No species of A. is a native of Britain.—The order is generally regarded as nearly allied to Apocynaceæ.

ASCLEPI'ADES, a Greek physician, born at Prusa, in Bithynia, who flourished during the early part of Cicero's life. He has been confounded with several other persons of the same name, and, in consequence, our accounts concerning him are both confused and contradictory. He seems to have wandered about considerably before he finally settled at Rome, as we read of his being at Alexandria, Parium on the Propontis, and Athens. It is not known either when he was born or when he died. A. was opposed to the principles of Hippocrates in medicine. Pliny, who professes very little respect for him, reduces his medicinal remedies to five: abstinence from flesh, abstinence from wine under certain circumstances, friction, walking, and 'gestation' or carriage exercise, by which he proposed to open the pores, and let the corpuscles which caused disease escape in perspiration; for his leading doctrine was, that all disease rose from an inharmonious distribution of the small, formless corpuscles of which the body was composed. He is said to have been very popular with the Romans on account of his pleasant and simple cures. His maxim was, that a physician ought to cure surely, swiftly, and agreeably—a thing which, unfortunately, is not always possible. A. is also alleged to have been the first who distinguished between acute and chronic diseases, but his knowledge of anatomy was apparently very slight. The fragments of his which remain have been gathered together, corrected, and published by Gumpert, under the title, *Asclepiadis Bithyni Fragmenta* (Weimar, 1798).

ASCLE'PIAS, or SWALLOW-WORT, a genus of plants, the type of the natural order *Asclepiadaceæ*. The corolla is wheel-shaped and reflexed; the coronet fleshy, and each of its hooded tips has a horn. The species are generally upright—seldom climbing and twining—herbaceous plants with opposite, whorled,

or alternate leaves. They are mostly American. The flowers are disposed in simple umbels between the leaf-stalks.—*A. Syriaca*, Syrian or Virginian Swallow-wort, sometimes called Virginian Silk, appears to be a native of North America, and not of Syria, as was supposed. It is frequently cultivated in flower-gardens. It has an unbranched stem 4—7 feet high; thick, ovate leaves, covered with a grayish down on the under side; and large, stalked, nodding umbels of many dull red flowers, which diffuse a strong and sweetish odor. The whole plant is full of an acrid white milk, which contains caoutchouc. The young shoots are eaten in North America like asparagus, as those of *A. stipitacea* are in Arabia. A brown well-tasted sugar is prepared in Canada from the flowers; and the silk-like down of the seeds has been used for the manufacture of textile fabrics, either alone, or along with wool or silk, but is more frequently employed for the preparation of wadding, and for stuffing mattresses and pillows. The plant appears, however, to be chiefly valuable for the fibre of its stalks, which is used for the manufacture of thread, cloth, ropes, nets, &c., in many parts of North America, and on account of which it has been recommended for general cultivation in Europe. The fibre is said to be of very superior quality. The plant rapidly extends by its creeping roots, and readily becomes a weed, where it has been introduced.—The roots of several other North American species are used as diaphoretics and expectorants, as *A. incarnata*, *A. tuberosa*, &c. The latter is a very ornamental garden-flower, and is called Butterfly Weed and Pleurisy Root in the United States, where it is frequent on stony and sandy grounds. *A. Curassavica* is called Wild Ipecacuanha in the West Indies, and a decoction of it is used by the negroes as an emetic and purgative.

A'SCOLI (anciently, *Asculum Picenum*), an old city of Italy, capital of the province Ascoli-Piceno, and the seat of a bishop, latitude 42° 50′ N., longitude 13° 37′ E. It is built on a hill, on the right bank of the Tronto, which formed the boundary between the late Roman and Neapolitan territories. Pop. (1872) 22,937. From the Adriatic, it is distant 16 miles west; from Ancona, 53 south. Its harbor (Porto d'Ascoli) has some coasting-trade, and is defended by two forts. The town is beautifully situated, commanding a fine view of the fertile valley through which the river flows, and of the rugged Apennines, which here rise to an elevation of 7212 feet.

In ancient times, it was inhabited by the Piceni, the descendants of a colony of Sabines, who maintained their independence against the Romans until 268 B.C. Nearly two centuries after, they took a prominent part in the Social War; and on the taking of their town by Pompeius Strabo, were subjected to the severest punishments. The town was annexed to the Papal States by Pope Clement V. in 1426; and with them passed to the kingdom of Italy.

ASELLI, ASELLIO, or ASELLIUS, CASPAR, a celebrated Italian physician, was born at Cremona about the year 1581. He served at first as a military surgeon, but afterwards became professor of anatomy and surgery at Padua. In 1622, while at Milan, where he was in the habit of spending a great portion of his time, he discovered the lacteal vessels. Before A.'s time, anatomists had supposed that the chyle was carried from the intestines into the liver by the mesenteric veins. Happening one day to dissect a living dog, he noticed for the first time the multitude of little vessels, which suck up the nutritive portion of the food. At first, he took them for nerves, and did not pay particular attention to them; but on pricking one with the point of his scalpel, a white liquid spurted out, and the discovery flashed on him in a moment. He seems, however, never to have understood or described them with complete accuracy. He died at the age of 45, leaving a treatise on the subject of his discovery, which was published a year after his death. It is entitled *De Lactibus, sive Lacteis Venis, Quarto Vasorum Mesaraicorum Genere, Novo Invento, Dissertatio*, and has several times been reprinted.

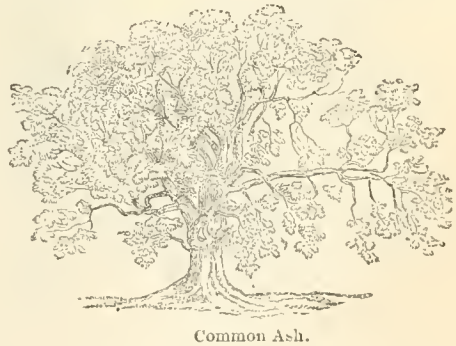
It is curious to reflect that such men as Gaspard Hoffman and Harvey zealously combated the opinions of A. It was nearly half a century before professional men admitted that a great discovery had been made in anatomy. See LACTEALS.

ASE'LLUS, in Ichthyology, a generic name now disused, but by which the cod and other *Gadidæ* were formerly sometimes designated. It is retained in the pharmacopœias, in the name of Cod-liver Oil, *Oleum jecoris aselli*.—The same generic name is now employed, in a different department of natural history, to denote a genus of small Isopod Crustaceans, one of which, *A. quaticus*, is common in stagnant ponds in Britain, and is sometimes called the Water Hog-louse. This genus is the type of a family, *Asellidæ*.

A'SES. The singular of this name in Old Norse is *As*, pl. *Aesir*; in Gothic, *Ans*; in Saxon, *Os* (*Es*). The A. are a race of gods in Northern or Scandinavian Mythology (q. v.), though not the oldest, yet the most powerful, like the Jupiter dynasty among the Greeks. They are usually considered as numbering twelve gods, and as many goddesses. The gods are—Odin, Thor, Baldur, Niord, Freyr, Tyr, Bragi, Heimdal, Widar, Wali, Uller, and Forseti; the best known of the goddesses—Frigga, Freyja, Idunna, Eira, and Saga. The worship of the A., or the Odin religion, was rooted not only among the nations of Scandinavia, but among the Germanic races generally, at least in its outlines. Besides other traces, proofs of its prevalence are to be found in a multitude of Gothic, Saxon, and Old High German proper names, many of which continue still in use, though their connection with German paganism passes unperceived: Oswald, Esmond, Oswin, Anselm, Ansgar, &c.

ASGILL, JOHN, an eccentric English *littérateur*, born about the middle of the 17th c. He studied for the bar, and at intervals during the whole of his chequered life transacted legal business in some form or other; but having early displayed a predilection for writing political pamphlets, he soon became involved, in spite of his cleverness, in serious pecuniary difficulties. Fortunately for *him*, parliament had just passed an act (1699) for the resumption of forfeited estates in Ireland, and commissioners were appointed to settle claims. A bright vision flitted across the mind of the much-harassed man. He sailed for the sister isle, and found the whole country wrangling in lawsuits. His talents, and the favor of the commissioners, secured to him a lucrative practice; and he even acquired sufficient influence to obtain a seat in the Irish parliament. Some time, however, before taking possession of his seat, A. had published a most extraordinary pamphlet, entitled *An Argument proving that, according to the Covenant of Eternal Life revealed in the Scriptures, Man may be translated hence into that Eternal Life without passing through Death, although the Humane Nature of Christ himself could not thus be translated till he had passed through Death* (1700). Much to A.'s surprise, the public flew into a rage against this absurd production; the Irish parliament voted it blasphemous libel, and the astonished author was expelled from the House after four days. In 1705, A. returned to England, and entered the English parliament as member for Bramber, in Sussex. But the fame of his unlucky pamphlet haunted him perpetually, and at last proved a Nemesis; for the English House, resolving not to be less virtuous than the Irish one, took up the treatise, condemned it to be burnt by the common hangman, as profane and blasphemous, and expelled A. on the 18th December, 1707. After this his circumstances rapidly grew worse, until at last he found something like peace in the King's Bench and the Fleet, between which two places his excursions were confined for the term of his natural life. Here he continued to practise professionally, and—for he never succeeded in overcoming this weakness—to indite innumerable pamphlets on political and theological topics. He died in November 1738.

ASH (*Fra'xinus*), a genus of trees belonging to the natural order *Oleaceæ*, and distinguished by very imperfect flowers, in which the



Common Ash.

calyx is obsolete, and the corolla either wanting or 3—4-partite; the fruit is a *samara*, a seed-vessel foliaceous at the extremity. The leaves are deciduous, and are pinnate with a terminal leaflet. There are about fifty species, mostly natives of Europe and of North America.—The COMMON ASH (*F. excelsior*) grows wild in the middle and south of Europe and north of Asia. It is an undoubted native of Britain. The flowers are quite naked; the leaves have five or six pairs of leaflets. The flowers appear before the leaves in spring, and the tree is not covered with leaves until the season is far advanced, losing them again early in autumn. It is, however, a most beautiful and umbrageous tree, highly ornamental in parks; but in parks or hedgerows it is extremely injurious to the grass or crops immediately around it. It rises to the height of 100—150 feet, generally with a smooth stem. The wood is white, tough, and hard, much valued by wheel-wrights, cart-wrights, coach-makers, joiners, and turners. It is also excellent for fuel. Sometimes it becomes irregular in the disposition of its fibres, and finely veined, and is then prized by cabinet-makers. The wood of the young trees is almost as valuable as that of the old. Indeed,

the value of the timber is greatest in trees of which the growth has been rapid, as it exhibits the characteristic toughness in the highest degree. The A. prefers a loamy soil, but grows in almost any, and succeeds in situations too elevated or too exposed for

Common Ash.

most other trees. It has of late been extensively planted in elevated situations in some parts of the north of Scotland, and there, in the more sheltered glens, it grows to a large size. Cultivation has produced and perpetuated a number of varieties, of which the most remarkable are the *Weeping A.*, with boughs bent almost straight down to the ground; the *Curled-leaved A.*, with dark-green wrinkled or curled leaves; and the *Entire-leaved A.*, a very curious variety, with many or all of the leaves simple (not pinnated), which has been erroneously regarded by some botanists as a distinct species, and named *F. simplicifolia*, *F. heterophylla*, &c.—The SMALL-LEAVED A. (*F. parvifolia*) and the LENTISK A. (*F. lentiscifolia*) are both natives of the shores of the Mediterranean, and are very graceful and ornamental trees.

The AMERICAN A., or WHITE A. (*F. Americana*), is readily distinguished from the Common A. by its lighter bark and paler green leaves. The flowers have a calyx, and the leaflets are shortly stalked and entire (those of the Common A. being sessile

Common Ash.

a, a branch with leaves; *b*, flowers; *c*, fruit on a considerably larger scale than the leaves and flowers.

and serrated). It is abundant in New Brunswick and Canada, but becomes rare to the south of New Jersey. The trunk often rises more than forty feet undivided. The wood is used for the same purposes as that of the Common A.—The RED A., or BLACK A. (*F. pubescens*), is very similar, but of smaller size, and has a deep brown bark. It is most abundant in Pennsylvania, Maryland, and Virginia, especially in swampy ground.—The BLACK A., or WATER A. of the New England States, New Brunswick, &c. (*F. sambucifolia*), is a large tree with buds of a deep blue color.—The BLUE A. of Ohio, Kentucky, Tennessee, &c. (*F. quadrangulata*), is also a large tree. The branches are quadrangular, the young shoots having on the angles four membranes which extend their whole length.—The GREEN A. (*F. juglandifolia*), readily recognized by the brilliant green of its young shoots, is chiefly found in the middle states; and the CAROLINA A. (*F. Caroliniana*), remarkable for the great size of its leaflets, chiefly in the southern states. Besides these, North America produces a considerable number of other species or varieties. The wood of all of them is used for somewhat similar purposes to that of the Common A.—In the south of Europe grows the MANNA A., or FLOWERING A. (*F. Ornus*, called *Ornus Europæa* by some botanists), whose flowers have a 4-partite calyx, and four small yellowish-white petals. The tree has much resemblance to the Common A. From it the substance called MANNA (q. v.) is obtained by means of transverse incisions in the bark; but in very favorable situations, it flows spontaneously during the greatest heat of summer. Manna is chiefly collected in Calabria and Sicily. A nearly allied species, *F. rotundifolia*, a native of Greece and the Ionian Islands, yields it also in perhaps equal quantity. The Common A. is said sometimes to produce the same exudation in the same warm climates.

The MOUNTAIN A. is the ROWAN TREE (q. v.), and belongs to a different natural order. Its resemblance to the A. is chiefly in its leaves.

The A. has a peculiar importance in Scandinavian mythology. The first man and woman formed were Ask and Embla (Ash and Elm). The court of the gods is represented in the Edda as held under an A., called Yggdrasil (q. v.). Connected, perhaps, with these traditions is the superstitious belief in A. twigs as a charm against witchcraft and magic.

ASHANTI′, or ASHANTEE′, a negro kingdom in Western Africa, on the north of the Gold Coast in lat. 6°—8° N., and long. 0°—3° W. It is mountainous, well watered and healthy, except in the lower alluvial districts. The principal rivers are the Volta, Prah, and Assinie. Pop. 1,000,000, of whom a fifth are warriors. The land is extremely fertile, producing maize, millet, rice, yams, tobacco, sugar, cocoa, the pine-apple, and other fine fruits, with gums, dye-woods, and timber. The principal exports are gold-dust and palm-oil, together with slaves. The natives are remarkable for their skill in certain articles of manufacture, their cottons are beautiful, as also their earthenware and sword-blades. The capital is Coomassie (q. v.).

The beginnings of the A. kingdom are obscure, but its traditions point to an emigration some hundreds of years ago from a region north of the Kong Mountains, probably caused by the spread of the Mohammedan empire of Timbuctoo. Our first positive glimpse of it is got in the year 1700, when Coomassie was made the capital by Osai Tootoo I., who conquered Akim, Assin, Gaman, Denkira, and other neighboring states, and became a sort of feudal sovereign over a large district. In their course of conquest over the Fantees, the Ashantis became involved in war with the British (1807—1826), and were finally driven from the sea-coast. In 1873—1874, in consequence of disputes arising in connection with the cession of the Dutch forts to Britain, they were again involved in a war with the same power; and an army under Sir Garnet Wolesley forced its way to the center of the kingdom. After a severe battle at Amoaful, and several days' fighting, Coomassie was taken, February 4, 1874, and burned on the 6th, and, though, the rainy season had set in, the army returned in safety to the coast. The people are sanguinary in disposition and in their religious ceremonies, but brave and more intelligent than the races along the coast.

A′SHBOURNE, a small town in a rich district near the left bank of the river Dove, in the west of Derbyshire. It lies on the steep south slope, with high hills on the north. It has a cruciform church, as old as the 13th c., with triplet lancet windows, which was restored in 1845 at the cost of £5000. Pop. in 1871, 2083, chiefly engaged in the cotton, lace, and iron manufacture, and in the cheese and malt trade. At A., in 1644, the parliamentary troops defeated those of Charles I. Pop. (1881) 3485.

A′SHBURTON, LORD (ALEXANDER BARING), born in 1774, a younger son of Sir Francis Baring, Bart., was, in early life, for many years commercially engaged in the United States and the Canadas, in the service of the great London mercantile house founded by his father. On the death of the latter, in 1810, he became the head of the firm of Baring Brothers & Co., and in 1812 was elected M. P. for Taunton. He represented that place, Callington, and Thetford, on the liberal interest, till 1831, and in 1832 was returned for North Essex as a moderate Conservative. In the short administration of Sir Robert Peel (1834—1835), he was President of the Board of Trade, and Master of the Mint, and was created Baron A. by patent in April 1835. This title had been conferred, in April 1782, on the celebrated lawyer John Dunning, who had married Alexander Baring's aunt, and it became extinct on the death of his cousin, the second Lord A., in 1823.

In 1842, Lord A.'s knowledge of business, and thorough acquaintance with American institutions, customs, and modes of thought, caused him to be appointed special ambassador to the United States, to settle the north-west boundary question, and other disputes, that then threatened to involve the two countries in war. In August of the same year, he concluded the famous treaty of Washington, commonly called the A. Treaty, by which

the frontier line between the state of Maine and Canada was definitely agreed to. By this treaty, seven-twelfths of the disputed ground, and the British settlement of Madawaska, were given to the United States, and only five-twelfths of the ground to Britain; but it secured a better military frontier to England, and included heights commanding the St. Lawrence, which the award of the king of Holland, who had been chosen arbiter, had assigned to the Americans. By the 8th and 9th articles, provisions are made for putting an end to the African slave-trade; and the tenth article provides for the mutual extradition of suspected criminals. Lord A. opposed free-trade, but strongly supported the penny-postage system when first proposed by Rowland Hill in 1837. He formed a valuable collection of old paintings. His death took place May 13, 1848.—His eldest son, William Bingham Baring, second Lord A. of this creation, born 1799, and educated at Oriel College, Oxford, entered parliament in 1836, as member for Taunton, and in September 1841 was appointed Secretary to the Board of Control. In February 1845 he became Paymaster-general of the Forces, and Treasury of the Navy. In 1855 he was made Commander of the Legion of Honor, and in 1860 he was president of the Geographical Society. He died in 1864.

A'SHBURTON, a small town in the south of Devonshire. It mainly consists of two paved streets crossing each other. It has a church in the Perpendicular style, with a tower 94 feet high. The population in 1871 was 2335,-employed in the mines, slate-quarries, and serge manufacture. Till 1868, A. returned one member to parliament.

A'SHBY-DE-LA-ZOU'CH, a small town near the source of the Mease, a tributary of the Trent, in the north-west of Leicestershire. Pop. in 1871, 7302. Leather-making is the principal manufacture, but nail-making, malting, wool-stapling, iron-smelting, and the manufactures of stockings, hats, and fire-bricks are carried on. In the neighborhood are collieries, and saline springs containing common salt in greater proportion than the sea; and ironstone, limestone, and fine clay are found. A canal 30 miles long, without a lock, connects the town with Coventry. The ruins of A. Castle stand on a height on the south side of the town. Mary, Queen of Scots, was once confined in this castle. St Helen's Church, an ancient structure with a tower, is the burying-place of the Hastings family, as well as of Selina, Countess of Huntingdon, the founder of the sect called the Countess of Huntingdon's Connection.

A'SHDOD. See AZOTUS.

ASHES, the remains of animal and vegetable bodies after burning. It is not strictly correct to speak of the ashes of a mineral. When lead, for instance, is exposed to heat, it turns to dross, which has the appearance of A., but is merely the lead combined with oxygen. In the same way, volcanic A., as they are called, are only a finer kind of pumice-stone, the solidified scum of molten lava. The ashes of organic substances destroyed by fire consist of the fixed salts contained in these substances. In land-plants, the most important are salts of potash, along with silica and lime, in sea-plants, soda takes the place of potash. By lixiviation of the A., the potash or soda is dissolved and separated from the insoluble mass, and is then purified by crystallization. The A. of sea-plants contain also more or less iodine. Peat and turf ashes contain, besides alkalies, more or less clay and sand; the same is true of pit-coal, which sometimes contains iron.

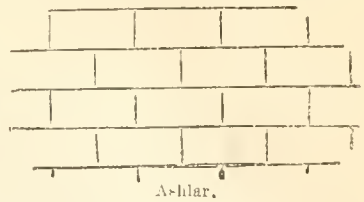
At one time, the A. or inorganic ingredients of plants were considered unessential to their existence. But the progress of vegetable chemistry has taught that a certain proportion of saline food is absolutely necessary to the development of plants. The analysis of the A. of the different kinds of vegetable substances has become of great interest.

The A. of animal bodies do not differ greatly from those of vegetables. Bone-A. consist essentially of lime united with phosphoric acid. This bone-earth is very valuable as manure for grain. In well-wooded countries, A. from burnt wood form an article of considerable trade. They are much used in the arts, as soap-boiling, bleaching, dyeing glassmaking, &c. Wood-A. are also used in washing and other domestic processes, as a cheap preparation of potash (q. v.).

The covering of the head with A. has long been a common sign of mourning among eastern nations, indicative of the very deepest distress. Instances of this are mentioned in Scripture. Penitents in the early Christian Church signified their sorrow and humiliation in like manner, by standing at the door of the church in 'sackcloth and ashes.' See ASH-WEDNESDAY.

ASHFORD, a small town on the west of the confluence of the two upper branches of the river Stour, near the middle of Kent. Pop. in 1871, 8458, which has largely increased from its having become the junction station of three great lines of railway. Damask is manufactured here.

A'SHLAR, or A'SHLER, building-stone squared and hewn, as distinguished from rubble, or rough stones which are used as they come from the quarry without being dressed. A. is laid in regular courses in building, and is of various kinds, according to the style of working that side of the stone which is to form the facing of the wall. Thus, there are *tooled* A.—the marks of the tooling being either *random* or in *grooves; polished* A., in which the face of the stone is rubbed smooth; and *rustic* A., in which only the joints are accurately hewn, the face of the stone being left projecting irregularly. Quarriers apply the term A. to squared stones before being hewn. In old documents, the term appears under a variety of forms, such as achlere, ashelar, aslure, and estlar.



Ashlar.

ASHLEY, LORD. See SHAFTESBURY.

ASHMOLE, ELIAS, a celebrated antiquary, was born at Lichfield on the 23d May 1617. In 1633, when only sixteen years of age, he commenced the study of law, and five years after, he was admitted to practice as a solicitor in Chancery. During the civil wars, he embraced the side of the Royalists, and was appointed captain in Lord Ashley's regiment, and comptroller of the Ordnance; but at the same time exhibited his love of study by joining Brazenose College, Oxford, where he sedulously applied himself to mathematics, natural philosophy, astronomy, and astrology. In 1646, he became acquainted with several famous astrologers; amongst others, William Lilly, whose conversation had a great charm for him; and in 1650, he published a work of Dr. Dee's, to which he subjoined a treatise of his own. Continuing with singular perseverance his researches in this dim region of superstitious philosophy, he was enabled, in the course of two or three years, to issue his *Theatrum Chymicum Britannicum*, which procured for him a high reputation, and the friendship even of men like John Selden. In 1658, appeared his *Way to Bliss*, a work on the philosopher's stone—the last he published in connection with astrology. At the restoration of King Charles various honors and emoluments were conferred upon him. In 1682, he presented to the university of Oxford a very fine collection of rarities, which properly, however, belonged to certain persons of the name of Tradescant. In this transaction he exhibited a rather mean ambition to exclude the rightful owners of the cabinet of curiosities from participating in the honor of the gift, and posterity has unfortunately gratified his wish by calling it the Ashmolean Museum. He died May 18, 1692, leaving behind him a large quantity of manuscript, a considerable portion of which has since been published.

ASHMUN, JEHUDI, an American philanthropist, was born at Champlain, in the State of New York, in 1794. He was educated with a view to the Christian ministry; but eventually became editor, in Washington, of a monthly magazine called *The Repertory*. In this periodical he advocated the views of the African Colonization Society for founding a colony of liberated negroes on the west coast of Africa. In 1821 he published a life of the Rev. Samuel Bacon, who had fallen a victim to an unsuccessful attempt to realize these views in the previous year. Learning the difficulties which surrounded a second attempt at planting a settlement in Africa, A. resolved to devote himself to the good work. Receiving an appointment as one of the agents of the African Colonization Society, he conducted a body of liberated negroes from Baltimore, and landed at Cape Mesurado, the seat of the infant colony, in the autumn of 1822. Dr. Ayres and the other agents of the Society having meanwhile abandoned the settlement from severe illness, he assumed the superintendence of affairs as the sole representative of that body. Here, for more than six years, he devoted his powers and his life to the establishing, on a fair and solid basis, this colony, so full of hope for the American negro. He showed great courage and tact in opposing the united forces of the natives at the outset of his management, and no less ability in after-negotiations with the chiefs, by which the colony acquired very considerable accessions to its territory. His health at length becoming sadly impaired, he bade adieu to the settlement, then recently called Liberia, in March, 1828, and landed at New Haven, Connecticut, in a state of great exhaustion. After a brief revival, he relapsed, and died on the 28th August 1828, in his thirty-fifth year. His remains were honored with a public funeral. A memoir of his life, by R. R. Gurley, appeared at Washington in 1835.

ASHTABU'LA, a rapidly increasing town of the state of Ohio, North America, on the Cleveland and Erie Railway, 3 miles from Lake Erie, and 49 miles north-east from Cleveland. It stands on a river of the same name, which flows into Lake Erie, and at the mouth of which there is a harbor. It is a place of considerable trade. Pop. (1880) 4445.

A'SHTAROTH. See ASTARTE.

A'SHTON-IN-MAKERFIELD, a small township in a carboniferous district in the Middle of South Lancashire. Pop. in 1871, 7463, chiefly engaged in collieries, and in the cotton manufacture.

A'SHTON-UNDER-LYNE, a town in the S.E. of Lancashire. Pop. (1871) 37,389; (1881) 43,389. It returns one member to parliament. It is a great seat of the cotton manufacture. The population is also employed in bleaching, dyeing, and calico-printing, in collieries, and in the manufacture of machines, bricks, &c. To the west of the town is a large moss or shaking bog, containing fir-trees full of turpentine, and black oak, with a loamy bottom at the depth of 10 feet.

ASH-WEDNESDAY, the first day of Lent (q.v.), so called from the Roman Catholic ceremony of strewing ashes on the head as a sign of penitence. This custom, probably introduced by Gregory the Great (590—604), was sanctioned by Pope Celestin III. in 1191, and afterwards generally prevailed. Before mass, the ashes were consecrated on the altar, sprinkled with holy water, and signed three times with the cross, while the priest recited the words *Memento quod cinis es, et in cinerem reverteris!* ('Remember that thou art dust, and must return to dust!') Next they were strewed on the heads of the officiating priests, the clergy, and the assembled people. The ashes were said to be those of the palms consecrated on the preceding Palm Sunday (q.v.)—The Protestant Church in Germany does not celebrate A. In the Church of England, it is observed by the stricter members, but without anything of the ceremony from which it derives its name; and the *commination*—a series of denunciations against impenitent offenders—is appointed to be read in the service for this day.

A'SIA, the largest division of land on the globe, generally regarded as the birthplace of the human race, and the most ancient seat of civilization. Its superficial area, including islands, has been estimated at from 16 to 20,000,000 square miles, and its population at 840,000,000. This enormous mass of continent lies almost entirely in the northern division of the eastern hemisphere, while its world of islands extend across the equator on the south-east. On three sides, it is surrounded by the ocean; but on the west, is partially connected with Africa and Europe. The continental mass is more than four times as large as Europe. Some idea may be formed of its vast extent by the calculation that, though it contains more than half of the whole population of the globe, the number of its inhabitants is so small compared with its area, that Europe may be said to be three times more densely populated. The coast-line is about 33,000 miles in length; and on the south and east, is diversified by seas, bays, and gulfs, affording advantages to navigation and commerce far superior to those of Africa, but inferior to those possessed by Europe and America. On the west side, the Dardanelles and the Sea of Marmora may be regarded as but a slight interruption of the great table-lands of Europe and A. which form the continent of the old world.

Horizontal Configuration.—A. is bounded N., by the Arctic Ocean; E., by the Pacific Ocean; S., by the Indian Ocean; and on the W., by Europe, the Black Sea, Archipelago, Mediterranean, and the Red Sea. On the extreme north-east the peninsular land of Kamstchatka is separated from North America only by the narrow Behring's Strait. On the south-east a bridge of numerous islands—Sumatra, Java, Borneo, Papua, &c.—extends towards Australia. The body of the continent may be regarded as a trapezium, of which the offsets, consisting of several large peninsulas, bear some resemblance to those of Europe; though in A. everything is on a more gigantic scale. Thus, one of these offsets, the peninsula of Arabia, is four times as large as France. On the west extends the peninsula of A. Minor, or Anatolia, divided from Europe by the Strait of Constantinople, the Sea of Marmora, and the Dardanelles, with the Black Sea on the north, and the Levant on the south. On the south of A., the peninsular configuration may be divided into three principal masses, corresponding to the southern coast of Europe: Arabia may be considered as a counterpart to Spain; Italy, with its neighbor-island Sicily, is represented by Hindustan and Ceylon; and, as in Europe, the broken Grecian peninsula is connected with A. by a bridge of numerous islands extending on the south-east, so, in A., the Eastern Peninsula (or India beyond the Ganges), lying between the Bay of Bengal and the Chinese Sea, is connected with Australia on the south-east by the vast Eastern Archipelago. This world of islands is divided into the several groups of the Philippine Islands, Borneo, Celebes, Molucca Islands, Sumatra and Java, Timor and the numerous adjoining isles. The east coast of A. is characterized by the deep indentations of the Pacific Ocean in the Chinese Sea, Yellow Sea, and Seas of Japan, Okhotsk, and Kamstchatka; all fringed with numerous islands, and separated by the peninsula of Corea, the island of Saghalien, and the peninsula of Kamstchatka. On the north, the Siberian coasts are also deeply indented, but rather by the embouchures of large rivers than by arms of the sea. The whole length of continental A., from the Dardanelles to the Japan Islands, is 6000 miles; its breadth, from Malacca to the north-east cape of Siberia, is 5300 miles; with its islands it extends from 10° S. lat. to 78° N., and from 36° E. long. to 190° E. or 170° W. Such an extent of surface must include all varieties of soil, climate, and production.

Vertical Configuration.—Equally grand are the features of this continent when regarded vertically: it has the most extensive lowlands, the most immense table-lands, the highest chains of mountains, and the most elevated summits in the world; tracts doomed to everlasting snow or scorching sterlity, salubrious valleys of continual verdure, and noisome jungles of the rankest growth. The table-lands of Asia occupy two-fifths of the whole continent. The eastern extremity is 2000 miles broad; the western, less than 1000. The whole mass may be regarded as consisting of two parts, separated, or, to speak more properly, perhaps, connected by the lofty, snow-covered mountain-isthmus of the Hindu Kush. These great divisions are styled respectively: 1. The Eastern Plateau, including the Table-land of Tibet, and the Desert of Gobi; 2. The Western Plateau, or Table-land of Iran. The former, a vast four-sided mass considerably larger than the whole area of Europe, extends 2800 miles from the mountain chain, Hindu Kush, to the Tonquin Gulf in China. On the south, the plateau is divided from the plains of Hindustan by the Himalaya Mountains, which have a mean height of 18,000 feet, while several of their summits rise from 25,000 to 29,000 feet above the level of the sea. Even the passes over this enormous range of mountains are almost as high as the summit of Mont Blanc. Here Dhwalagiri, long supposed to be the Mont Blanc of the Himalayas, and with precisely the same signification, viz., 'white mountain,' rising to 26,826 feet, leaves all the peaks of the Andes far below; while Kunchinjinga reaches to 28,156 feet, and Mount Everest, now believed to be the loftiest summit in the world, attains the height of 29,002 feet. Cultivation is found at 10,000 feet above the sea; while flocks graze some 4000 feet higher. In Eastern Tatary and Tibet, the ground is cultivated at a height only 2000 feet lower than the summit of Mont Blanc. On the east, the table-land of Tibet is bounded by the Chinese mountain ranges Yun-ling and Khing-khan, which, towards the south, are connected with wild Chinese alpine regions of which little is known; while towards the north, they extend into another mountainous region, where the eastern chain of Shangpe-shan opposes to the Pacific Ocean a wall of rock 3000 feet high. On the north, the chain of the Altaï Mountains, 3000 miles long, and divided into several groups, forms the boundary between the great plateau and the plain of Siberia, which is larger than the whole area of Europe.

The Western Plateau, or Table-land of Iran, rises generally about 5000 feet above the sea; but in some parts to 7000 feet; descending again, however, in the central and southern parts, where it spreads out into sandy and gravelly plains, to 2000 and 1200 feet. It has been divided into three sections: the Plateau of Iran proper; the Median-Armenian Alpine region; and the Anatolian Table-land. The *first* division, or the Plateau of Iran, has a mean altitude of about 3000 feet. Salt plains, with gravel and sand, form large portions of the surface, and mountain-walls on all sides hem it in. On the northern edge ascend the Persian mountains; on the east, the steep and lofty parallel chains of the Indo-Persian boundary mountains; and on the south, the plateau, for 1000 miles along the Persian Gulf and Arabian Sea, is bounded by the wild terraced regions of Beloochistan and Farsistan. The *second* division, or the Median Armenian Alpine region, includes the mountainous regions of Armenia, Kurdistan, and Azerbijan. Here the table-land is compressed to about half its general width. From this plateau, of which a part is mentioned in Scripture as 'the mountains of Ararat,' rises the volcanic cone commonly styled Mount Ararat, to the height of 17,212 feet above the sea-level. Anatolia, the *third* and most westerly division of the table-land, is bounded along the shores of the Black Sea by mountains rising to 6000 or 7000 feet, and partly covered with forests; on the south-west the Taurus chain of mountains, beginning in the islands of Rhodes, Cos, &c., extends in several ramifications through a part of Asia Minor, runs in a single range along the coast of Karamania, and in the east an occasional height of 12,000 and 13,000 feet.

The Western Plateau, thus divided into three sections, is full of diversities of soil and scenery. A great part of the table-land of Iran (or Persia) is extremely barren and arid, which serves to explain the enthusiastic terms in which the Persian poets have spoken of the beautiful valleys found here and there among the mountains. The coasts of the Persian Gulf are sandy wastes. Between Irak and Khorassan, a desert of clay, covered with salt and nitre, varied only by patches of verdure here and there, occupies 27,000 square miles, and joins the wide sandy desert of Kernan. A great part of Beloochistan is an arid plain, covered with red sand.

Besides these central masses, there are several detached mountain chains and plateaus. The Ural Mountains, forming the land-boundary between Europe and Asia, and separated from the Altaï chain by salt lakes, marshes, and deserts, are divided into three sections: the Northern, Central, and Southern Ural. The second of these divisions is rich in minerals—gold, platina, magnetic irons and copper. On the isthmus between the Black Sea and the Cas-

pian, the alpine ridges of the Caucasus reach a height of from 10,000 to 11,000 feet, while individual peaks tower up to the gigantic height of 17,000 or 18,000 feet, as, in the still faintly volcanic peak of Elbruz (18,493 feet) and Kasbeck (16,523)—both, however, on the northern or European side of the main mass of the Caucasus. The high lands of Syria rise gradually from the neighboring deserts to the height of 10,000 feet in Libanus and Antilibanus, and slope steeply in terraces down to the narrow coast-lands of Phœnicia and Palestine. The plateau of the Deccan, in India, rises to an average height of from 1500 to 2000 feet, and is divided on the west from the narrow coast-level of Malabar by the Western Ghauts, 4700 feet; on the east, from the broad level coast of Coromandel, by the Eastern Ghauts. On the north, it is divided from the low plains of Hindustan by the Vindhya and Malwah mountain chains; and, on the south, the Ghauts unite at the sources of the Cavery, and form the Neilgherry (or Blue Mountains, 8760 feet high), the loftiest in the peninsular portion of Hindustan. These slope steeply down to a low narrow plain, then rise again to a considerable height in the Aligherry range, sink into the sea at Cape Comorin, and reappear in the group of Adam's Peak in Ceylon. The Malayan Mountains, or chains of the Eastern Peninsula, may be regarded as offsets of the Sine-shan, and extend to the extreme south point of A., reappearing with volcanic peaks in the Sunda Islands.

The six great *Lowlands* of A. are, 1st, The *Siberian* lowlands in the north, which is by far the largest. It stretches from the northern declivities of the Altaï and Uruf Mountains to the shores of the Arctic Sea, and is, for the most part, cold, gloomy, and barren. 2d, The *Bucharian* lowland, or the wild sterile waste between the level of the Caspian Sea and Lake Aral, much of it beneath the level of the sea. It is composed to a large extent of gravelly soil. 3d, The *Syrian and Arabian* lowland, the south of which is hot and arid, with almost no oases; but the north is watered by the Tigris and Euphrates. 4th, The lowlands of *Hindustan*, comprising the great Indian desert, 400 miles broad, together with the vast and fertile plains of Bengal, generally called the Valley of the Ganges, and ranking, perhaps, next to China as a region of fertility. 5th, The *Indo-Chinese* lowlands, comprising the long levels of the Burman empire, through which flows the Irrawady, and the rich regions of Cambodia and Siam. 6th, The *Chinese* lowlands, commencing in the east at Pekin, and extending as far south as the Tropic of Cancer, containing 210,000 square miles, or an area seven times the size of Lombardy. It is watered by a copious river-system and numerous canals, and may be regarded as a vast garden, exceeding in productiveness all other parts of the world.

Hydrography.—The hydrography of A. displays as striking a variety as the structure of its land. The alpine regions send down in some directions torrents of water, which form rivers almost rivaling in magnificence those of America, and which flow for hundreds of miles through plains of unsurpassed fertility. On the other hand, there are wide stretching tracts, like the deserts of Africa, destitute of water, and doomed to eternal sterility. Only one large sheet of water, Lake Hamoon or Seistan (q. v.), refreshes the high table-land of Iran. The low steppe of Turan contains the Caspian Sea (q. v.), the largest of all lakes, and Lake Aral (q. v.). In the valley of Cashmere lies Lake Ular, 40 miles in circumference, and the only considerable sheet of water in the Himalaya chain. At the northern base of this mountain-chain, Lake Palte is remarkable for its annular form. In Tibet and the Altaï Mountains, lakes are very numerous.

One of the most striking characteristics of Asian river-systems is found in its double rivers, or two streams rising in the same region, flowing in almost parallel directions, and either uniting, or nearly so, before entering the sea. Among these twin rivers may be mentioned—the Syr-Daria and Amu-Daria, flowing into Lake Aral; the Euphrates and Tigris, in Western A., surrounding the plain of Mesopotamia, uniting at Koona, and together flowing into the Persian Gulf; the Ganges and Brahmaputra; and the Yang-tze-kiang and Hoang-ho, in China, rising near each other, then widely separated in their courses, but again approaching each other, and both falling into the Yellow Sea, only 100 miles apart.

The six great river-systems of A., comprising rivers which will be found fully noticed under their respective names, are—the Mesopotamian, that of North-west India, that of North-east India and Tibet, the Indo-Chinese, the Chinese, and the Siberian. The *first* comprises the two famous streams, the Tigris and Euphrates. The *second* comprises the Indus with its tributaries. The *third* system comprises the Brahmaputra and Ganges. The *fourth* system comprises the rivers of the Indo-Chinese peninsula; the chief of which are the Irrawaddy, the Martaban or Saluen, the Me-nam, and the Me-king or Cambodia. The *fifth* system is the Chinese. It comprises four great streams, all of which flow in an eastern or north-eastern direction into the Pacific; the Hong-kiang, or Canton River; the Yang-tze-kiang (or Son of the Sea); the Hoang-ho, or Yellow River; and the Amur. The *sixth* system comprises the large rivers of Siberia, the principal of which are the Obi, the Yenisei, and the Lena. They all have their sources in the Altaian Mountains; flow north, or nearly so; and for 800 or 900 miles before their embouchure, traverse a dreary, flat, monotonous waste, until their sluggish waters creep into the Frozen Sea.

Geology.—The geological structure of Asia is so complex, the different formations are so broken up and scattered, that a general description would be unintelligible. We must refer to separate notices, where the geological structure and phenomena of circumscribed districts will be given in detail, and the reader will, in this way, be enabled to form a correct impression of the geology of Asia as a whole. See INDIA, CHINA, TIBET, &c.

Natural History.—The vast extent of A., and its great diversities of climate, naturally lead us to expect in it a great variety of natural productions, both animal and vegetable. This expectation is heightened when we consider how completely this vast continent is divided into separate portions by mountain ranges of great altitude, and how extensive the mountainous tracts themselves are, as well as the great extent of the elevated plateaux or table-lands, and when we add to these considerations that of the peculiar character of wide regions—wastes of sand—level steppes—and extensive districts of which the soil is strongly impregnated with salt. Accordingly, we find, both in the flora and fauna of Asia, all the variety which such considerations might lead us to expect.

The most northerly part of the continent, however, differs comparatively little in its productions from the corresponding parts of Europe and America. It exhibits the same arctic flora, with differences comparatively inconsiderable. Pines, birches, and willows form, as in the other continents, the last forests of the north; but upon account of the more severe climate, they do not reach a limit so northerly as in Europe, and particularly in the west of Europe. Some of the common plants of Europe are abundant as far east as Kamstchatka; the Crowberry (*Empetrum vigrum*), so plentiful in the moors of Scotland, is still more plentiful throughout Siberia; the same *Vaccinia* (Bilberries, &c.) and *Rubi* (brambles, &c.) abound in the Kamstchatkan forests as in those of Scandinavia. There are, however, interesting differences. Heaths are comparatively rare in Asia, its flora agreeing in this respect with that of America, rather than with that of Europe. The larch, which in Europe occurs only on the central mountains, extends far northward at the mouth of the Obi to the utmost limits of arborescent vegetation; probably a mere variety of the same species, although it has been described as distinct. In Kamstchatka, a different kind of birch replaces the common birch of Europe as a forest tree, and the Siberian stone pine is different from that of the south of Europe. Siberia in its less frigid regions produces a luxuriant vegetation, of which herbaceous plants of unusually large size for a cold or temperate climate are a characteristic feature; as species of Rhubarb, Angelica, and Cow-parsnip (*Heracleum*), some of which are now well known in Britain. It is indeed from the central and eastern temperate parts of Asia that the cultivated species of rhubarb are derived, and from the same region the rhubarb root, so valuable in medicine, is brought. In the abundance of *Grossulariaceæ* (Currants), the warmer parts of Siberia resemble North America, although most of the species are different.

To the south of the Altaian Mountains, the flora of Asia corresponds in part with that of the great eastern plain of Europe; but it exhibits also peculiarities which may in some measure be ascribed to the saline character of large districts, the stony or sandy desolation of others, and the elevation of the great central plateau. The flora of Asia Minor and of Syria has a general resemblance to that of the south of Europe, although exhibiting also features which belong rather to that of India or of Africa. Shrubby *Labiatæ* are particularly characteristic of this region, from which not a few of them have found their way into the gardens of Europe and of other parts of the world, upon account of their fragrance, their medicinal qualities, or their use for the grateful seasoning of food.—The tropical flora of Arabia abounds in trees which yield fragrant balsams and resins, particularly of the natural order *Amyridaceæ*. Indeed, both the warmer temperate and the tropical regions of Asia excel other parts of the world in the number and variety of the odoriferous drugs which they produce, with odors of the most various characters, from myrrh and frankincense to asafœtida. Arabia has long been noted for the production of coffee, which is now also pretty extensively cultivated in other warm parts of A. The date-palm is as characteristic of Arabia as it is of Egypt. Acacias and mimosas also abound.—The flora of Persia in part resembles that of Arabia, although it is less tropical, and the altitude of its mountains gives to it in some places an extremely different character.—The abundance of *Scitamineæ* is regarded as particularly characteristic of India; and plants of this order yield ginger, galangal, cardamoms, turmeric, and other articles of commerce, amongst which not the least is a kind of arrow-root. Its *Leguminosæ* are also very numerous, both herbaceous and shrubby, or arborescent, many of them exhibiting great beauty of foliage and splendor of flowers; some producing useful kinds of pulse; others timber, gum, medicines, &c. The number of valu-

able medicinal plants which belong to the Indian flora is very great, as is also that of dyewoods; and it abounds in fine fruits, of which the mango and mangosteen may be particularly noticed. *Cucurbitaceæ* (Gourds) are very numerous; as are also trees of the genus *Ficus* (Fig), some of which produce caoutchouc, and amongst which are the sacred peepul and the banian-tree, so remarkable for the roots which descend from its branches to become new stems, and for the extent of ground which it canopies. Palms are numerous in the tropical parts of A., and particularly in the south-eastern regions, but less numerous than in the tropical parts of South America. The cocoa-nut is one of the most common palms in the vicinity of the sea. Some of the Asiatic palms are valuable for the sago which they yield. The natural order *Dipteraceæ* is one of those that are peculiar to India and south-eastern A., and includes some of the noblest timber-trees; but the Indian teak, so valuable for ship-building, is of the order *Verbenaceæ*.

The flora of the Eastern Peninsula, Siam, Cochin-China and, the south-eastern part of A. generally, differs considerably from that of India, and exhibits, if possible, a richer variety. The change from the Indian flora is still greater in the islands, and a resemblance to that of Polynesia and of Australia begins to appear. The bread-fruit takes the place of its congener, the jack of India. These regions produce nutmegs, cloves, and other spices. The *Lauraceæ* are abundant, yielding cinnamon, cassia, and camphor. Gutta-percha has recently been added to the number of the most valuable exports. China and Japan have many plants peculiar to themselves, and are remarkable for the prevalence of the *Ternstræmiaceæ*, the natural order to which the tea-plant and the camellia belong. It is scarcely necessary to mention how extensively tea is cultivated in China, and how important it is in the commerce of the world. The diversity of climate, however, both in China and Japan, is so considerable, as to imply no small diversity of productions. In like manner, the Himalaya Mountains possess a flora very different from that of the Indian plains, and which in some of its most characteristic features, particularly in the prevalence of large rhododendrons and magnolias, has been found remarkably to agree with the flora of the southern parts of the United States; whilst at still greater altitudes there is a strong resemblance to that of more northern regions, or of the European Alps; forests of pines appear, and along with them the *deodar*, a cedar scarcely, if at all different from the cedar of Lebanon. The mountains of Java also produce oaks and other trees resembling those of the temperate zone, although the species are peculiar. But many parts of A. have as yet been very imperfectly explored.

Many of the cultivated plants of Europe are known to be natives of A., and others are supposed to be so. As the cradle of the human race, and the scene of the earliest civilization, it is natural to suppose that it supplied the first fruits and other vegetable productions which man sought to improve by cultivation; and of some which, as the apple and the cherry, are probably natives of Europe, it seems probable that the first improved varieties were introduced from A. We do not know with certainty of what part of the earth some of the principal cereal plants or grains are natives—as wheat, barley, oats and rye; but there seems great probability in the supposition that they are of Asiatic origin. Rice certainly is. It has been cultivated from time immemorial in some of the warm parts of A.; and its introduction into other quarters of the world is comparatively recent. Maize—introduced from America—is now to be reckoned among the most important cultivated plants of A., and its cultivation is rapidly extending, as is that of the potato. Wheat, oats, barley, rye, beans, pease, and buckwheat, are the principal crops of regions similar in climate to those in which they are cultivated in Europe. Barley and buckwheat are cultivated in the Himalayas at the extraordinary elevation of almost 12,000 feet, and crops of barley are to be seen even at 15,000 feet above the sea.

Millet of different kinds, durra, and other grains of inferior importance, are cultivated to some extent in India and other warm regions; also different kinds of pulse. The banana and plantain are of the same importance as in other tropical countries; and the yam and cocco or eddoes contribute largely to the supply of human food. The sugar-cane is cultivated in the warm parts of A., but not with so much spirit or success as in America, although it is a native of the East and not of the West Indies. Pepper is one of the native productions of the East Indies, and is extensively cultivated. Tobacco, whether or not any species of it is indigenous to A,, is now produced in large quantities. Indigo is extensively cultivated in India, and the opium poppy too extensively. Different species of cotton are natives of India, and have long been cultivated there and in China. Hemp is cultivated in India, not for its fibre, but to afford the means of intoxication; and flax chiefly for the oil of its seeds; but both hemp and flax are extensively cultivated for their fibres in other parts of A.; and India and the other tropical regions produce many plants valuable for their fibres, among which are species of *Musa*, *Corchorus* (yielding the jute of commerce), and *Urtica* (nettle). Among the crops of India is sesamum, valued for the oil of its seeds.

It seems probable that we are indebted to the warmer temperate parts of A. not only for the orange, the lemon, and all the other species of the genus *Citrus*, but also for the olive, the peach, and nectarine, the apricot, the fig, the mulberry, and the vine, with many other of the fruits now most generally esteemed and cultivated. China and Japan being the seats of an ancient civilization, many useful plants have long been cultivated there, which have scarcely yet found their way into other parts of the world. Floriculture has been practised there with great assiduity from a remote antiquity; and varieties of Hydrangea, Camellia, Tree Pæony, Chrysanthemum, &c., have, from time immemorial, been scarcely if at all less numerous than those of the tulip and hyacinth in Holland.

The zoology of A. is not less interesting than its botany. Amongst domestic animals, the most important are the ox and buffalo, the sheep, the goat, the horse, the ass, the camel, and the elephant. A number of species of ox and buffalo are natives of A., from more than one of which the domesticated races appear to have derived their origin. Very distinct from all the others is the yak (q. v.) of Tibet, a creature which is of great use to the inhabitants of the elevated regions of the Himalayas, and is to them almost what the reindeer is to the Laplander. The sheep and goat are natives of the mountainous parts of Central A. The horse and the ass seem to belong to the same regions; and all of these have been domesticated from the earliest times. The camel is of incalculable value as a beast of burden in the regions of heat and drought, and as affording the means of traversing the great deserts. It is used principally in the southwest of A. and in India. The elephant is a native of the tropical parts of A., but is of a different species from that of Africa. The reindeer constitutes the chief wealth of some of the tribes of the north. Dogs are also used by some of the Siberian tribes for drawing their sledges. Different races of dogs are domesticated in different parts of A., and a small kind is fattened for its flesh in China; but in the Mohammedan parts of A., the dog is reckoned an unclean animal, and is known chiefly as a prowler about towns and villages, and a devourer of offal.

The tropical parts of A. abound in monkeys, of which the species are very numerous. Among them are some with long, and some with short tails, but none with prehensile tails, like the sapajous of America. Many are altogether tailless, and among these is the orang-outang, found in the south-eastern islands. A much larger ape, called the pongo, has been said to exist in Borneo, but it is still a doubtful species. The same warm regions abound in bats, many of which are of large size, and feed upon fruits, not upon insects. The flying lemur or colugo is another remarkable animal of the Indian Archipelago.—Bears are found in all parts of A.—the white bear in the extreme north, and other formidable species in the more temperate parts; whilst the tropical regions produce bears which are by no means ferocious, and feed chiefly on insects, fruits, and honey. Badgers are also found in A., and quadrupeds of several other plantigrade genera, allied to the bear, but of comparatively small size and inoffensive habits, as the beautiful Panda (*Ailurus*) of the north of India, and the Binturongs (*Ictides*) of Malacca and the neighboring archipelago.—Animals of the Weasel family (*Mustelidæ*) are numerous, among which the Teledu (*Mydaus meliceps*) of Java rivals the skunks of America in the horrible stench with which it surrounds itself for defence. More important are the sable and sea otter, pursued in the northern regions upon account of their furs.—Of the Dog family, or *Canidæ*, A. has not only wild dogs, but also wolves, foxes, hyænas, and jackals; the two former abounding chiefly in the colder, the two latter in the warmer regions. The arctic fox inhabits the most northerly shores and islands. The warmer parts of A. produce a number of species of the allied family of the *Viveridæ*, among which are the mangouste or Indian ichneumon—famous, like the Egyptian ichneumon, for the destruction of serpents—and the civet, from which is obtained a celebrated perfume.—Of feline animals, the most dreadful are the lion and tiger; the latter of which is peculiar to A., abounding in the warm regions of the south and east, never extending westward beyond the mountains and deserts which separate India from Persia; but, on the contrary, advancing far to the north, beyond the limits to which the lion advances, and even to the confines of Siberia. The leopard, the ounce, and many other cats, some of them large and dangerous, are found in A., especially in the warmer parts of it. Among them may be mentioned the chetah, or hunting-leopard, tamed for the chase in India.—A few small marsupial (or pouched) quadrupeds (*Phalangers*) are found in the Moluccas, and form one of the links by which the natural history of A. is connected with that of Australia.—The *Glires* or *Rodentia*, on the contrary, are numerous in all parts of A., and many species are peculiar to it. Squirrels, marmots, rats, mice, hares, &c., are common in all except the most northerly regions. The brown rat, now so common in Europe, is said to have emigrated from Persia so recently as the beginning of the 18th c. Lemmings abound in Siberia and the Tatarian deserts, of which the jerboa is also an inhabitant. Porcupines are frequent in the warmer parts of A.,

and the beaver is found in the north.—Of Edentate quadrupeds, the Pangolins (*Manis*) alone are Asiatic, and these are confined to the tropical regions.—Of *Pachydermata*, there are, besides the elephant, the horse, &c., already mentioned, several species of rhinoceros, wild boars, the babyroussa, and a species of tapir; all, except the wild boar, natives of the warmest etimates. One of the most interesting facts, however, connected with the natural history of A., is the abundance of remains of the mammoth, or fossil elephant, in the coldest parts of Siberia, its tusks still affording a considerable supply of ivory.—Of ruminating animals, besides those of the ox-kind, already mentioned, and the sheep and goat, there are deer, antelopes, and musks or musk-deer.

The reindeer and elk are natives of Siberia; further south, the species of deer are much more numerous, and the same countries produce many species of antelope. The musks are found in the central and southern parts of the continent; one of them, a native of the highest mountains, yielding the much-prized perfume from which it derives its name.—A. possesses vultures, eagles, and other *Falconidæ*, owls, ravens, and other birds of the crow kind, herons, storks, cranes, &c. Swans, geese, ducks of various species, and many other *Anatidæ*, frequent its waters, some of them abounding even in the coldest regions. Albatrosses are very numerous on the Kamstchatkan shores; flamingoes on those of the more southern countries. Pigeons abound, and among them is the turtle-dove. The gouras of the Indian Archipelago are birds of the pigeon family, of which one species is almost as large as a turkey. There are many kinds of thrush, finch, warbler, bunting, sparrow, and other birds identical with or allied to those of Europe, among which is the nightingale, often mentioned by the Persian poets, and many also, particularly in the warmer regions, which are peculiar and characteristic. Of these may be mentioned the splendid birds of paradise of the south-eastern islands, peacocks, pheasants, &c. The gallinaceous birds of Asia are numerous, and from this continent were probably derived the domestic poultry of other parts of the earth. The abundance of the parrot tribe constitutes a point of resemblance between the tropical parts of Asia and other tropical countries, but lories are peculiar to the East Indies. The ostrich inhabits the deserts of Arabia as well as of Africa. The cassowary is found in the south-eastern islands. The edible swallows' nests of the East Indian coasts have long been celebrated.—Lizards and other saurian reptiles are very abundant in the warmer parts of Asia; and great crocodiles and gavials infest the rivers of the East Indies. Boas, pythons, and other great serpents, are found in the tropical regions, which produce also many venomous serpents. The cobra da capello is one of the most dreaded. But the temperate parts of Asia have also venomous serpents, scarcely less dangerous. Some of the East Indian tortoises are remarkable for their great magnitude, and turtles are found in the seas.—Both the salt and fresh waters of Asia produce many kinds of fish. The *Salmonidæ* of the rivers of Siberia supply an important part of the food of its inhabitants. The goldfish, now so well known in Britain, is a native of China. Some of the fish of the tropical parts of Asia have attracted attention from the peculiarity of their form or habits. Insect life is exceedingly abundant in the warm parts of Asia, as in all other warm countries. Bees are numerous, and honey is produced in great quantities. Of other insects, it seems only necessary here to mention the silk-worm, which was introduced from Asia into Europe; and the locust, which sometimes devastates great tracts of the Asiatic countries bordering on the Mediterranean and the Black Sea, and occasionally extends its ravages into regions further west. Of molluscous animals, the pearl-oyster deserves particular notice, upon account of the important pearl-fisheries which exist in different places.

Ethnography.—The whole population, consisting of 840,000,000 people, may be divided into the Mongolian, Aryan, and Semitic groups. The *first* of these includes all the peoples and tribes in the east, north, and south-east of Asia; the *second* (see ARYAN RACE) embraces the inhabitants of Northern India, Afghanistan, Persia, and part of Asiatic Turkey; the *third* includes the Syrian, Hebrew, and Arabian races (see ETHNOLOGY).

A further subdivision and classification may be made as follows: 1. The *East-Asian group*, including the people of Tibet, China, Japan, Corea, and the Indo-Chinese peninsula; all alike in the use of monosyllabic languages. This last people, however must be subdivided into Western and Eastern, the former comprising the inhabitants of the Burman empire, Pegu, Laos, and Siam, having affinities with the Hindus; and the latter, comprising the inhabitants of Tonquin, Cochin-China, and Cambodia, have affinities with the Mongolians of Tibet and China. 2. The *Tartar group*, including the Turkomans, Mongols, and Tungusians, who are spread over the whole table-land of Central Asia and the neighboring lands in the north. The Turkoman family is divided into three sections—the first including the east Turkomans, inhabiting Tashkend, Khiva, Balkh, and Usbekistan; the second including the so-called Tatars of the Urals and the neighborhood of Astrakhan and Kazan; the third including the Turks or Osmanli. With the exception of a few small tribes in Siberia, all the Turkish varieties are Mohammedans, use the Arabic alphabet, and employ numerous Arabic words in their dialects. 3. The *Siberian group*, including the Samoiedes, people of Kamstchatka, &c., speaking languages which have only recently been studied by philologists. 4. The *Malay-Polynesian group*, mixed with Australasian negritos, are spread over all the islands of Polynesia and the Indian Archipelago. The Malayan people of Java, Sumatra, Celebes, the peninsula of Malacca, the Sunda Islands, Moluccas, and Philippines, have an incipient literature, which has been formed under Moslem and (since the 16th c.) under European influence. The South Sea islanders are clearly divided into two races by physical form, color, and language. One race is allied to the Australasian negrito, and the other to the Malayan. In most of the islands, there is a partial intermixture of the two races, but generally the distinction is obvious. It is probable that all the copper-colored Polynesians belong to the same family with the people of the Indian Archipelago. 5. The *Deccan group*, including all the people employing the Tamul, Carnatic, Telugu, and Singalese languages, all having a certain measure of civilization and a literature. 6. The *Indo-Germanic* or *Aryan group*, marked and subdivided by the three languages, Sanscrit, Persian, and Armenian. About thirty distinct nations, each having a peculiar dialect and literature, belong to the first subdivision; the second includes the peoples of Beloochistan, Afghanistan, Persia, and Kurdistan; the third, the Armenians. All these families have literatures partly written in dead languages — the Sanscrit, Pali, Zend, and old Armenian. 7. The heterogeneous tribes inhabiting the Caucasus, whose affinities are not yet settled. 8. The *Semitic group*, including all the peoples whose languages are related to the Hebrew and Arabic.

Religions.—The same Asian characteristic of variety and wide contrast is found in the creeds as in the countries and tribes of people: the Brahminical religion of India; the doctrines of Buddha, Confucius, and of Lao-tse in China; the worship of the Grand Lama in Tibet; the creed of Islam in several varieties in Arabia, Persia, and India; the rude heathenism of the north; the various sects of native Christians in Armenia, Syria, Kurdistan, and India; the Greek Church in Siberia; these and other forms of faith or religious profession display diversities and contrasts nearly as striking as those of Asian geography. Christianity, now the religion of Europe and America, owes its origin to Asia. For an account of the existing religious systems of Asia, see articles MOHAMMEDANISM, INDIA (*Religion*), BUDDHISM, LAMAISM, &c.

Civilization.—The number of people civilized—in the Asiatic sense of the word—is far greater than that of wild and nomadic hordes; but culture here, when arrived at a certain point, assumes a stationary character, widely differing from the restless intellectual activity and industrial progress of Europe. The laws of states, families, industry, commerce, art, and science are, in India and China, so many branches of one fixed and permanent religious system, which has maintained its sway through many centuries, and would long remain unchanged, if left undisturbed by European influence. The Arabs, Persians, and Turks, collectively known as the Easterns, are distinct in civilization from the Hindus and Chinese. The institution of slavery among the former, of *caste* among the Hindus, and the civil and political equality of China, are distinguishing marks. The Turk is a monotheist and fatalist; the Hindu is either a mystical pantheist or polytheist, acknowledging a multitude of gods; the Chinese is rather a utilitarian moralist.

Industry.—The industry and commerce of the Asiatic continent bear no adequate proportion to its capabilities—such as they are, they will be described under the different countries.

Political Aspect.—The political institutions of A. present to us some striking contrasts. While the barbarous hordes in the north live almost without the idea of government, and scarcely know that the Russian czar claims them as his subjects; and the nomadic tribes, under their khans or sheiks, have a sort of patriarchal government, subordinate to higher powers; the most extreme forms of monarchy and despotism have existed among the more cultivated nations. The government of China is an absolute monarchy in form, but, in fact, is strictly limited by the force of tradition. The emperor is apparently unlimited in authority; but it is an essential duty of an emperor to rule exactly according to the precepts handed down by his ancestors.

Reverence for ancestors and their institutions is, therefore, the sole presiding and conservative principle which has so long preserved the great Chinese empire from political changes. A., now so passive, anciently took an active part in the great movements of the world's history; contended against Egypt and Greece, and afterwards contributed to the greatness and glory of the Macedonian and Roman empires. From the north of the Caspian Sea, came the vast hordes of the Huns who spread themselves abroad over Europe. The armies of Genghis Khan and Tamerlane overran the Slavonian plains, while the Arab califs, with their fanatical troops, established their religion and government in three quarters of the world. Under the Osmanli fell the eastern Roman empire,

and still the Turk maintains a political position in Europe, but one now becoming very feeble and insecure. In proportion as Europe has advanced, A. has declined in political power, so as to countenance the theory of a gradual movement of the spirit of civilization and progress from the eastern to the western world. So soon as the Asiatic nations have reached a certain moderate pitch of culture, the history of civilization ceases so far as they are concerned, and is followed by the mere chronology of states or dynasties. It would appear that all great future changes in the destinies of the peoples of Asia must proceed from European impulses. When Portuguese ships had rounded the Cape and so reached India, a new era of Asian history began. The Portuguese, the Spaniards, Dutch, French, Danes, and English planted their standards on Indian soil. The English speedily extended their dominion here, and soon overshadowed all the other European powers; though the Portuguese and French still maintain their footing in Hindustan, and the French, the Spaniards, and the Dutch own large territories in Further India or the Indian Archipelago. Lately England has increased her influence in the extreme west of Asia; having secured the right to occupy Cyprus, while guaranteeing the defence of the Asiatic dominions of the Porte. Meanwhile Russia has extended her sway over Siberia, Caucasia, and Turkestan; securing thus the keys of China and the approaches to Persia. Even in some of the nominally independent powers, European influence is very powerful; the throne of Persia, for example, is surrounded by European diplomatists. And while Russia and Britain are striving to share between them supremacy in Asia, the French and the Americans have a large share of the commerce of the Eastern coasts.

The following table gives an approximate estimate of the area and population of A., according to the more important existing political divisions:

State.	*Area in Square Miles*	*Population.*
Chinese Empire:		
China Proper,	1,530,000	405,000,000
Dependencies of Mantchuria, Mongolia, Tibet, Corea, &c.	2,410,000	28,500,000
Japan	155,517	33,299,014
Independent Arabia	956,000	3,700,000
Persia	630,000	5,000,000
Afghanistan	275,000	4,000,000
Kafiristan	20,000	300,000
Beloochistan	105,500	1,000,000
Independent Turkestan:		
Turkoman Territory	79,000	175,000
Khiva	22,000	700,000
Bokhara	83,000	2,286,000
Eastern Turkestan (q. v.)	427,000	580,000
Dzungaria	133,000	500,000
Further India:		
Anam	196,000	21,000,000
Burmah	190,000	4,000,000
Siam	305,000	5,750,000
Tribes south of Assam	18,000	130,000
Cambodia	33,000	890,000
Independent Malacca	31,000	209,000
Asiatic Turkey, including the Turkish possessions in Arabia	742,000	13,171,000
British Possessions in Asia:		
Hindustan: Immediate possessions	899,341	191,095,445
Native States more or less completely under English influence	557,903	492,203,053
Straits Settlements	1,206	308,097
Hong-Kong	32	121,985
Labuan	45	4,898
Nicobar and Andaman Islands	3,276	18,500
Russian Possessions:		
Caucasus (partly in Europe)	172,170	4,893,332
Siberia	4,765,400	3,405,084
Central Asia	1,079,283	3,356,759
Ferghana (Khokand)	28,160	960,000
French Possessions:		
Cochin China	21,632	1,526,867
French India (including Chandernagore, Karikal, Mahé, and Pondicherry)	196	266,308
Portuguese Possessions:		
Goa, Salcète, Bardez, &c.	1,390	474 234
Damao	30	40,980
Diu and Gogola	12	12,303
In Indian Archipelago	5,506	[?] 250,000
In China [Macao]	1	71,834
Dutch Possessions in the Indian Archipelago [Java, parts of Sumatra, Celebes, Borneo,] &c	612,520	24,370,600

ASIA, CENTRAL. This term is usually, in its geographical sense, used of the region lying between the Altai Mountains and the Persian Gulf, and includes part of Siberia, all Turkestan, Afghanistan, Beloochistan, and part of Persia. An earlier usage —that of Humboldt—gives this name to the khanates of Bokhara and Independent Tartary. In Russian official language, Central Asia is an administrative division of the empire lying to the S. W. of Siberia, and comprising, with part of what used to be called Siberia, the recent Russian annexations in Turkestan. Russian Central Asia is divided into the governments of Akmollinsk, Semipalatinsk, Turgai, Uralsk, Semiretchensk, Syr-Darai, Saref-chan, Kuldja, Amu-Daria, the Trans-Caspian territory, and Ferghana. The total area is given at 1,227,000 sq. miles, and the pop. at 4,490,000.

ASIA'GO, a town of North Italy, 22 miles North from Vicenza. It stands on a ridge, among the Southern spurs of the Alps. It is celebrated for the manufacture of straw-hats, and also for carpenter-work and turning. Pop. 5140. The surrounding district known as the 'Seven Communes,' is well wooded, and abounds in sheep and cattle (SETTE COMMUNI).

A'SIA MI'NOR, the ancient name of what is now called Anatolia (q. v.). Here, in Ionia, was the early seat of Grecian civilization, and here were the countries of Phrygia, Lycia, Caria, Paphlagonia, Bithynia, Lydia, Pamphylia, Isauria, Cilicia, Galatia, Cappadocia, &c., with Troy, Ephesus, Smyrna, and many other great and famous cities. Here, from the obscure era of Semiramis (about 2,000 years B. C.), to the time of Osman (about 1300 A. D), the greatest conquerors of the world contended for supremacy; and here took place the wars of the Medes and Persians with the Scythians; of the Greeks with the Persians; of the Romans with Mithridates and the Parthians; of the Arabs, Seljuks, Mongols, and Osmons with the weak Byzantine empire. It was here that Alexander the Great and the Romans successively contended for the mastery of the civilized world. But, notwithstanding all these wars, the country still continued to enjoy some measure of prosperity till it fell into the hands of the Turks, under whose military despotism its ancient civilization has been sadly brought to ruin.

ASINALU'NGA, or SINGA LONA, (anc. *Ad Meusulas*), a town of Tuscany, North-Italy, in the province of Siena Railway. It is beautifully situated on hills bordering the Val di Chiana, and is a well-built town, with wide and well-paved streets, and a handsome collegiate church, in which are many fine paintings. Pop. of commune, 8500.

ASKEW, or ASCOUGH, ANNE, one of the sufferers for Protestant opinions at the dawn of the Reformation in England. Having embraced the views of the reformers, she was turned out of doors by her husband, a gentleman of Lincolnshire, and a zealous Roman Catholic. On this she went up to London to sue for a separation; but was eventually arrested on a charge of heresy, and was examined by the Bishop of London and others on the doctrine of transubstantiation, the truth of which she denied. After further examination and torture by the rack, she was burned at the stake, in Smithfield, July 16, 1546.

ASMANNSHAU'SEN, a village in the jurisdiction of Rüdesheim, Nassau, is famed for the wine which is produced on the slate-mountains in its vicinity. Of this there are two kinds, red and white, the former of which is greatly preferred. It has a rich red, color, like Burgundy, possesses a rare aromatic flavor, and is noted for its uncommon strength and fire. But it retains its excellent qualities only about three or four years; after which, year by year it becomes weaker, and loses its color. The choicest sort, which is preferred by connoisseurs to all the red wines of the Rhine, and even to Burgundy itself, is cultivated in the ducal vineyards at Wiesbaden.

ASMODE'US (properly, ÂSCHMEDAI, 'the destroyer'), an evil genius or demon mentioned in the later Jewish writings. A. was described as the author of many evils. In the Book of Tobit (q. v.), he is represented as slaying the seven husbands of Sara, and hence, in modern times, has been jocularly spoken of as the destroying demon of matrimonial happiness. In the Talmud, A. is described as the prince of demons, and is said to have driven Solomon from his kingdom.

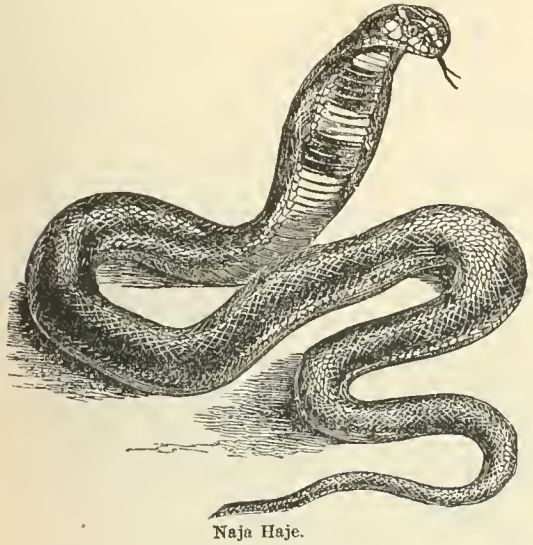
ASMONÆ'ANS. See MACCABEES.

ASO'CA (*Jonesia Asoca*), an Indian tree of the natural order *Leguminosæ*, sub-order *Cæsalpineæ*, remarkable for the beauty of its red and orange flowers. The leaves are abruptly pinnate, shining, and very beautiful. The A. is often mentioned in Indian poetry, and is connected also in various ways with the Hindu mythology.

ASO'LA, a fortified town of Northern Italy, in the province of Brescia, situated on the left bank of the Chiese, 19 miles west-north-west from Mantua. It is a place of great antiquity. The chief branch of industry, not agriculture, is the manufacture of silk twist. Pop. of commune, 5500.

ASP (*aspis*), a venomous serpent, the name of which has come down from ancient times; the vague description of ancient authors, however, causing uncertainty as to the species. It is very generally supposed to be the *Naja Haje*, the El Haje or Haje Nasher of the Arabs, which is very common in Egypt, Cyprus, &c., and often appears in hieroglyphic and other sculptures as one of the sacred animals of ancient Egypt. It is sometimes from 3 to 5 feet in length, of nearly equal thickness throughout, with a gradually tapering tail; brownish, varied with dark and pale spots; the scales of the neck, back, and upper surface of the tail slightly carinated; the tail about one-fourth of the whole length of the animal. The neck is capable of considerable dilatation, through the

distension of its loose skin, although not so much as that of the nearly allied cobra da capello of India (*Naja tripudians*). The dilatation of the neck takes place when the serpent is irritated. The jugglers of Egypt are accustomed to perform tricks with this serpent, as those of India with the cobra da capello, causing it to dance to their music; after they have first, however, carefully extracted the poison-fangs. It is very venomous. Several varieties exist at the Cape of Good Hope, one of which is nearly white; and one is called Spuugh Slang, or Spitting Snake, by the colonists, from its supposed power of ejecting its poison to a distance



Naja Haje.

when irritated; the poison which distils from the fangs in such circumstances being probably carried off by the forcible expirations which the creature makes—a characteristic, however, not exclusively belonging to a particular variety.—Other serpents of the same family, *Viperidæ*, are by some believed to be the true asp, particularly *Vipera Echis* and *V. Cerastes*. The former is of a grayish or yellowish brown color, with rays and eye-like spots on the upper parts; it is found both in India and the north of Africa. The latter is of a grayish color, and has a very broad heart-shaped head, a short obtuse rounded muzzle, and the superciliary or eyebrow scales remarkably developed, so that one of them is often produced into a sort of spine; it inhabits the deserts of Northern Africa.—The name asp is now generally given to *Vipera Aspis*, a native of the Alps, found also in the south-east of Europe and in Sicily, which much resembles the common viper, but is more slender, and has a larger head; it is also more venomous.

ASPA'RAGINE ($C_8H_8N_2O_6$,2HO) is a crystalline substance which exists ready formed in common asparagus, in the marsh-mallow, in comfrey, in potatoes, in chestnuts, in the leaves of the deadly nightshade, in liquorice-root, in the milky juice of the lettuce, in the tubers of the dahlia, and in the young shoots of vetches, peas, beans, &c. According to Piria, the young shoots of these plants, when formed in the light, contain as much asparagine as when they are grown in the dark, but the asparagine disappears as the plant arrives at the flowering stage. Other chemists, including Pasteur, find that vetches grown in light are free from asparagine. This substance is readily obtained from the expressed juice of the young shoots of asparagus, of young vetches, &c., which, after filtration and evaporation to a syrup, soon deposits it in crystalline prisms of a right rhombic form. These crystals dissolve freely in boiling water, the cooled solution having a mawkish and cooling taste, and a slight acid reaction. Asparagine exhibits two remarkable transformations. (1.) When its aqueous solution is heated with alkalies or acids, it is decomposed into aspartic acid ($C_8H_7NO_8$) and ammonia; from this and other reactions, there is no doubt that it should be regarded, according to modern views, as the Amide (q.v.) of aspartic acid. (2.) While a solution of pure asparagine-crystals remains unchanged, if any coloring matter is present the solution passes into fermentation, and the whole of the asparagine is converted, by the assimilation of hydrogen, from the pigment into succinate of ammonia, a reaction which may be expressed as follows:

Asparagine. Succinate of Ammonia.

$$C_8H_8N_2O_6,2HO + H_2 = 2NH_4,C_8H_4O_8.$$

Like most of the amides, this substance unites both with acids and alkalies, but the resulting compounds are of little general interest. That asparagine plays an important part in the physiology of plants, is obvious from its wide distribution.

ASPA'RAGUS, a genus of plants of the natural order *Liliaceæ*, having an almost bell-shaped six-partite perianth upon an articulated stalk, six stamens, one style, with three recurved stigmas, and the cells of the berry two-seeded. The species of this genus are herbaceous or shrubby plants, natives chiefly of the south of Europe and of Africa, with abortively diœcious flowers; the stem is unarmed in some, in others thorny; at its first sprouting leafless, and covered with scales at the top; afterwards very much branched, with numerous fasciculate, generally bristle-like leaves. The most widely diffused species is the Common A., *A. officinalis*, a native of Europe, which grows on the banks of rivers and on the seashore, in meadows and bushy places, especially in sandy soils, occurring in a few places in Britain, and is also in general cultivation as a garden vegetable; its young shoots, when they first sprout from the earth, forming a much esteemed article of food, which, however, is only in a slight degree nutritious. These sprouts contain a peculiar crystalline substance, called *Asparagine*, and have a specific action on the urinary organs, so that their long continued use in very large quantities is apt even to produce bloody urine.

They are no longer retained in the pharmacopœia, but both the shoots and the roots of A. are still occasionally used as a diuretic in dropsies, and as a lithic to dissolve urinary calculi. For these purposes, the root is preferred, and is administered in the form of an infusion or decoction.—The thick and tender kinds of A. are most esteemed for the table. It is one of those plants which have been much increased in size, and considerably altered in general appearance, by cultivation, being seldom more than a foot high in its wild state, and not much thicker than a goose-quill, whereas it has been obtained in gardens more than half an inch in diameter, and its stems rise to the height of four or five feet. It was a favorite vegetable of the ancient Romans. It is generally planted in rows, at distances varying from 1 foot to 2½ feet. Litter or vegetable mould is spread over it in autumn. It is allowed to occupy the same ground for many years, and the shoots are not gathered for use till the plants are four years old. Some of the growers of A. for the London market have 100 acres under this crop.

Asparagus.
a, a young shoot; *b*, flowers; *c*, the upper end of a stem, showing branches, leaves, and fruit [all reduced].

—The seeds have been used as a substitute for coffee, and are recommended for that use upon the continent, even at the present day. A kind of spirit has been made from the fermented berries. The young shoots of several other species are also eaten, as those of *A. tenuifolius*, *A. acutifolius*, and *A. albus*, natives of the south of Europe; the last of which is much used in Spain and Portugal as a salad, in soups, and as a boiled vegetable. On the other hand, the sprouts of the Bitter A., *A. scaber*, which is very similar to the Common A., are uneatable, on account of their great bitterness.

ASPA'RAGUS STONE. See APATITE.

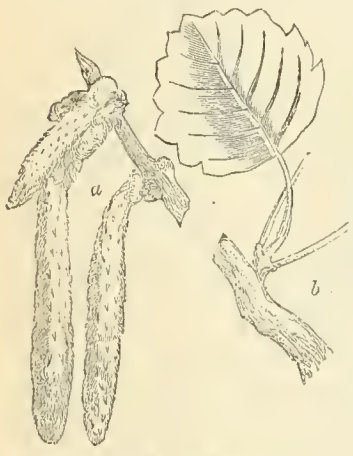
ASPA'SIA, one of the most remarkable women of antiquity was the daughter of Axiochus, and born at Miletus. The circumstance that in Athens all foreign women, whatever their character, were equally esteemed, or rather disesteemed, and that their children, even when begotten in wedlock, were held illegitimate, has originated the erroneous notion that A. was a courtesan. She certainly broke through the restraint which confined Athenian matrons to their own homes; for after her union with Pericles, who had parted from his first wife by her own consent, her house became the rendezvous of all the learned and distinguished people in Athens. Socrates often visited her. Her eloquence and knowledge of politics were extraordinarily great. Her husband—though, strictly speaking, the Athenian law would have refused this appellation to Pericles—was honored with the title of Olympian Jove, while she herself was dignified with the name of Juno. From the comic writers and others, she received much injustice. It was Hermippus, the comic poet, who took advantage of a temporary irritation of the Athenians against Pericles, to accuse A. of impiety; but the eloquence of the great statesman disarmed the enmity of the judges, and procured her acquittal. Her influence over Pericles must have been singularly great, although this has obviously been exaggerated, and even caricatured. The brilliant

but not historically accurate Aristophanes charges her with the origin both of the Samian and Peloponnesian war, the latter on account of the robbery of a favorite maid who belonged to her. Plutarch vindicates her against such accusations; and Thucydides, who details minutely the causes of the Peloponnesian war, does not once mention her name in connection with these. After the death of Pericles, A. married Lysicles, a cattle-dealer (an important, lucrative, and dignified profession in ancient times), who, through her influence, soon became an eminent man in Athens. The name of A. was, after her death, applied to many women of remarkable accomplishments and amiability.

A'SPECTS, in Astronomy, are certain positions of planets with respect to one another, as seen from the earth. In the days of astrology, there were five aspects—Conjunction (indicated by the Symbol (☌), Sextile (*), Quartile (□), Trine (△), Oppysition (☍). Two planets are in conjunction when they have the same longitude; the aspect is sextile when they are 60° apart; quartile, when the distance is 90°; trine, when it is 120°; and at 180° they are opposite to one another, or in opposition. Astrology ascribed to these A. great influence over the fate of individuals and of nations. The only two of the terms now in use are *conjunction* and *opposition*.

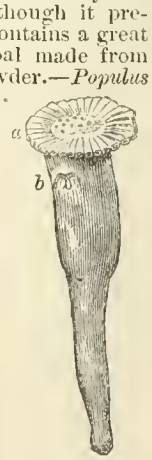
A'SPÉ, a town of Valencia, Spain, in the province of Alicante, and 21 miles west from Alicante, near the river Elcha. It is pretty well built, but the streets are narrow and winding. It has numerous flour-mills and oil-mills, also soap-manufactories and brandy distilleries. There is a considerable trade in wine. Pop. 6744.

A'SPEN, or TREMULOUS POPLAR (*Po'pulus tre'mula*, see POPLAR), a tree which grows plentifully in Europe and Siberia. It is a native of Britain, and is frequent in Scotland, where it is found even at an elevation of 1500 feet above the sea. It has received the specific name *tremula*, from the readiness with which its leaves are thrown into a tremulous motion by the slightest breath of wind — a property for which, indeed, the aspen-leaf has become proverbial. The leaves are nearly orbicular, but broadly toothed, so as almost to exhibit angles. The footstalks are compressed, which favors the readiness of motion. It grows quickly, with a straight stem, reaching to a height of from 60 to 80, or even 100 feet. In unfavorable situations, it becomes dwarfish. The wood is soft, porous, light, white, and smooth; it does not make good fuel, but is very fit for the turning-lathe, and especially for being made into troughs, trays, pails, &c. It is deemed excellent for arrows. If the stem be peeled and allowed to dry before it be cut down, the wood becomes harder, and is then capable of being used as timber for the interior of houses; and on this account the tree is of great importance in many districts, and the more so as it succeeds in any soil, although it prefers one which is moist and gravelly. The bark contains a great quantity of a bitter alkaloid, *Salicin*. The charcoal made from this tree can be used in the manufacture of gunpowder.—*Populus trépida*, a very similar species, a native of North America, is called the American A. It is regarded by some as a mere variety. Very similar, also, is another North American species, *P. grandidentata*.



Aspen, [*Populus tremula*], reduced. *a*, a portion of a branch with catkins; *b*, do., with leaves.

ASPERGI'LLUM, a remarkable genus of Lamellibranchiate Conchiferous Mollusca, in which the shell has the form of an elongated cone, terminating at the larger end in a disk, which is pierced with numerous small tubular holes, the little tubes of the outer range being largest, and forming a sort of ray around it. The animals of this genus are borers, some of them living in sand, others burrowing in stone, wood, or thick shells. *A. Javanum* is popularly called the Watering-pot, and the same resemblance has suggested the name A. (from the Latin *aspergo*, to sprinkle). The most interesting circumstance in the structure of the shelly tube of A. is the presence of two small valves, incorporated in the substance of the tube, to which they bear a very small proportion. 'They there form the stamp,' says Owen, 'of its true affinities, but subserve as little any ordinary final purpose as the teeth buried in the gums of the fœtal whale.' The affinities are with mollusca inhabiting bivalve shells. A rudimentary bivalve shell is found, in like manner, cemented into the shelly tube of the fossil *Teredina*, which bored the drift wood of the London clay.



Aspergillum. *a*, the disk with holes; *b*, the rudimentary valves.

There is also a genus ASPERGILLUS in Botany, containing many of the small fungi commonly known by the name of Mould (q. v.), which occur on decaying substances of various kinds. Some of the species are peculiar to diseased animal tissues.

A'SPERN, or GROSS A'SPERN, a village of Austria, on the left bank of the Danube, 5 miles E.N.E. of Vienna. Pop. about 700. This village and the neighboring one of Essling are celebrated as the scene of a sanguinary battle in the summer of 1809, between the French army under Napoleon I. and the Austrians under Archduke Charles. After the battle of Eckmühl, in which the Austrians were defeated, the Archduke retired to the left bank of the Danube, leaving the road to Vienna open to the French. On the 12th of May 1809, the French army entered Vienna, when the Archduke concentrated his forces on the opposite bank of the river. Napoleon threw bridges over the river, and on the 21st the French army began crossing to the attack. The Austrians at first seemed to give way; but when about half the French had crossed the river, they returned to the charge, and almost surrounded the enemy in the narrow plain between the two villages. Here ensued the battle of Aspern, a terrific conflict, the grand object of the contending hosts being the possession of the villages. At the close of the day, it remained undecided; but next morning it was renewed with fury on either side, when, after terrible slaughter, Napoleon ordered a retreat, and his shattered ranks retired to the little island of Lobau, in the middle of the river, whence they afterwards slowly withdrew to the right bank. The loss on the side of the Austrians was given at 4000 killed, and 16,000 wounded; that of the French at double that amount. Marshal Lannes, the most daring among the French generals, was among the slain. Both the villages were reduced to heaps of ruins.

ASPE'RULA. See WOODRUFF.

ASPHA'LT, or ASPHA'LTUM, is the name given to a bituminous substance of solid consistence. See BITUMEN. It probably owes its origin to vegetable matter which has been subjected to a slow process of decomposition or decay, resulting in the production of a bituminous coal, from which, by volcanic agency, the A. has been distilled and diffused over the neighboring district. The largest natural deposit of A. is in the island of Trinidad, where the plain known as the *Pitch Lake* is found. See TRINIDAD. The A. from Trinidad is largely used for ships' bottoms, and is reputed to kill the teredo or borer, which proves itself so very destructive to the wood of ships in tropical regions. A. is also found on the shores of the Dead Sea in large quantity, and is known to the Arabs by the name of *Hajar Mousa*, or *Moses's Stone*. It likewise occurs in South America at Coxitambo near Cuenca, in Alsace, and other parts of the European continent, in East Lothian and Fifeshire (Scotland), in Shropshire, &c.

During the manufacture of coal-gas, much tarry matter is evolved from the retort, and is received in the coolers or condensers. If this tar be subjected to partial distillation, naphtha and other volatile matters escape, and an artificial A. is left behind, which possesses the principal properties, and can be employed for the majority of purposes to which native A. is applied. The various kinds of A. have a pitchy odor, are of a black or dark-brown color, but do not soil the fingers; are insoluble in water, sparingly soluble in alcohol; but are in great part dissolved by ether, oil of turpentine, and naphtha. *Petroleum* (q. v.), or *Rock Oil*, is a native liquid bitumen, which largely exudes from crevices in rocks in many districts, and is essentially A. dissolved in naphtha. The specific gravity of A. is very near that of water, ranging from 1000 to 1100. When set fire to, it burns readily with a smoky flame, and is often used in the smaller gasworks as fuel, by being allowed to run very slowly into the furnace-fires. A., besides being employed for coating the exterior of ships' bottoms, is also used, in a heated condition, for saturating timber which is intended for piles in the construction of breakwaters, river-bridges, and other situations where the combined action of the air, water, and minute animals would soon render ordinary wood rotten and useless. Wooden houses may be preserved in the same manner by a coating of A. applied externally; and ground-flooring placed in damp situations is much the better of the spaces between the planks being filled up with A.

About 1840, A. began to be generally used for foot-pavements in cities, and also for floors of cellars and outhouses. For purposes of this nature it is heated in portable boilers, into which, at a certain stage of the preparation, there is poured a quantity of thoroughly dried sand, gravel, or powdered limestone, which is well mixed with the liquid A. The mixture is then spread on the spot prepared for it; and when cool, forms a hard kind of pavement. Of this method of forming footways, high expectations

were at first formed; but latterly the process of asphalting has gone out of use in England, as it is found not to be so durable as stone, and therefore, in ordinary circumstances, more costly. In Paris, however, asphalting is still extensively practised in the more spacious thoroughfares. The better kinds of A. are used in the manufacture of the black varnish, which is employed in forming the enamel which coats the variety of leather known as *Patent Leather*. A. is not of itself used in medicine, but its natural solution is naphtha, viz., *Petroleum*, is a valuable agent when applied either externally or internally. The synonyms of A. are — *Native Pitch, Mineral Pitch, Jews' Pitch, Dead Sea Bitumen, Compact Bitumen, Trinidad Bitumen*, and *Maltha*.

White Asphodel.

A'SPHODEL (*Aspho'delus*), a genus of plants which has by many botanists been made the type of a natural order *Asphodeleæ*, now, however, generally regarded as forming part of the order *Liliaceæ*. The *Asphodeleæ* are either fibrous-rooted or bulbous-rooted. Among the latter are onions, hyacinths, squills, star of Bethlehem, &c.; among the former, asparagus, A., &c. The roots of the asphodels are fleshy and thick. The species are not very numerous, and are mostly natives of the countries around the Mediterranean Sea. The Yellow A. (*A. luteus*) and the White A. (*A. albus*) have long been known in Britain as garden-flowers. The yellow A. has an unbranched stem 2—3 feet high, much covered by the sheathing bases of the long narrow leaves. The leaves of the white A. are all radical, and its flowers are in branched clusters. Both species flower about the time when spring passes into summer.

ASPHY'XIA (Gr.) means literally a cessation of the pulsation from any cause, but is usually applied to the condition resulting from the blood in the body no longer being brought into the proper relations to the atmospheric air by respiration, so as to allow a sufficiently free exchange of carbonic acid and oxygen. See RESPIRATION. A., or suspended respiration, may result from several causes. No air, or but a scanty supply, may be admitted, as in strangulation, drowning, choking, or disease in the windpipe; the chest may be prevented from expanding either from a superincumbent weight or paralysis, as when a man breaks the upper part of his neck above the phrenic nerve, thus paralyzing the diaphragm; and again, although there may be every capacity for respiration, the air itself may be in fault, and contain too little oxygen in proportion to other elements, as carbonic acid or sulphuretted hydrogen, which act as poisons when inhaled. Aquatic animals may be asphyxiated either by depriving the water they inhabit of oxygen, or impregnating it with the gases just mentioned.

As this condition of A. advances, in drowning or otherwise, the small vessels of the lungs become gorged with blood, which the heart has no longer power to force freely through them, the right side of the heart and pulmonary artery become filled with blood, while but little returns to the arterial or left side of the heart.

The person becomes pallid, except in such vascular parts as the lips, cheeks, and finger-tips, which become blue; and soon the blood, no longer aërated, produces the phenomena of poisoning by carbonic acid. After some slight convulsive movements, the person becomes insensible, the pulsations of the heart grow gradually feebler, and at last cease altogether. In man this occurs in from a minute and a half to five minutes. Some persons, no doubt as the Ceylon divers, can by habit do without a fresh supply of air for a longer period; and some diving animals have an arrangement of blood-vessels by which they are enabled to be under water for a long time. Restoration of asphyxiated persons may be attempted with hopes of success at a very long period after apparent death. The object of all methods is of course to fill the lungs with fresh air. One of the most efficient is that of the late Marshall Hall: lay the person down at once with his head on his left arm, open the mouth, and draw the tongue forwards, then roll him gently over towards the left till he is nearly quite over on his face, then on to his back again, making the body by its own weight compress the chest, which, on expansion by its elasticity, fills with air. Repeat this about 15 times in a minute. This remedy nearly superseded all others for the restoration of still-born infants and other asphyxiated persons, before the introduction of the method of Dr. Sylvester, an account of which is given under RESPIRATION, ARTIFICIAL.

ASPHY'XIANTS. Chemical substances enclosed in shells or other projectiles, and which act by producing a suffocating and poisonous effect. The French secretly made experiments with asphyxiating shot at Brest in 1851. The principal of these missiles seems to have been to carry into an enemy's ship the means of generating deadly gases which would suffocate the crews between decks. Scientific artillerists dread and discountenance these novelties; they have learned to regard war almost as a mathematical science, or, at any rate, as an elaborate application of such science; and they see nothing but savage cruelty in the 'diabolical chemistry' of asphyxiants. General Sir Howard Douglas, in a late edition of his *Naval Gunnery*, says: 'The author learns, with great regret, that some awful experiments have been made with fearful success, in the royal arsenal, with asphyxiant projectiles, combining in a frightful degree incendiary with suffocating effects.' Adverting to sick and wounded men on board a ship-of-war, he exclaimed: 'What shall be said of that inhuman system preparing for naval warfare in this age of enlightened humanity, which would advisedly, purposely, and deliberately consign the whole of these, and all other survivors, to indiscriminate death or mutilation? A ship may be sunk in action; yet there is always time to remove the sick and wounded, and save the survivors; but who shall approach a ship on fire to rescue her crew from the sudden and awful effects of that merciless and barbarous system, the object of which is to set fire to her at heart, and if possible, blow her up?' The Earl of Dundonald, Captain Norton, Mr. Macintosh, and many other inventors, some years ago brought asphyxiating composition before the notice of the English Admiralty and War-office; and the French arsenals were known to possess many such in store. Some of these compositions are liquids which burn fiercely, and ignite wood and canvas readily; some are contained in shells which, on bursting, scatter the suffocating and burning substances all around; and some assume other forms.

ASPI'DIUM. See FERN, MALE.

ASPINWALL, a town in Colombia, virtually, however, a colony of the United States. It is situated at the Atlantic extremity of the Panama Railway, and of the inter-oceanic Canal in progress, being about 8 miles to the north of the old Spanish port of Chagres, 49 miles from Panama, and equi-distant from the great trading capitals of Valparaiso and San Francisco. From its commanding position as a place of transit, A. is one of the busiest and most prosperous towns in the New World. It monopolizes the benefits of the traffic in both directions, to the almost utter exclusion of the rapidly decaying Panama. The climate of A., formerly very unhealthy, has been greatly improved by drainage. A. derives its name from Mr. Aspinwall the originator of the Panama Railway: it is also called *Colon*.

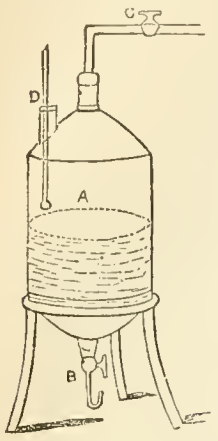
A'SPIRATE, the name given to the letter *h* in grammar, as marking, not an articulate sound, but a *breathing* (Lat. *spiro*, I breathe). It is also applied to a class of consonants. There is felt at once to be a relation, accompanied by a difference, between *p* and *f*, *t* and *th*, &c. To express the difference, the Greeks called the first of such a pair *psilon* (bare), the second *dasu* (rough); the Latin grammarians adopted the terms *lene* and *aspirate*, probably from the erroneous notion that the difference consists in the addition of the sound of *h*. There being no sound and no character in Latin corresponding to the Greek θ (*theta*), the Romans represented it by *th*; and this misleading expedient is continued for representing this aspirate and several others in all the alphabets derived from the Roman. According to some, the word ought to be *asperate*, i. e., 'roughened.' Of the sixteen mutes in a complete system (see LETTERS), eight are lene, each having its corresponding aspirate.

Lene— *p, b, t, d, k, g, s, z.*
Aspirate—*f, v, th*(in), *th*(ine), *ch, gh, sh, zh.*

In the corresponding words of allied languages, nothing is more common than the interchange of an aspirate and a lene: Ex., Lat. *pater*, Eng. *father*; Gr. *thura*, Ger. *thür*, Eng. *door*; Lat. *cap*(ut), Fr. *chef*, Eng. *chief*; Ger. *weib*, Eng. *wife*. Aspirated letters are also frequently interchangeable with one another: thus, Gr.

ther, a wild beast, is in Lat. *fera;* Lat. *facere*, to do, becomes in Span. *hacer*.

ASPIRA'TOR is the name of an apparatus employed to draw air or other gases through bottles or other vessels. It is of great use in the examination of gases by the analytical chemist. The simplest form of the apparatus is that represented in the figure, where a is a large vessel capable of being filled with water, having a tube with stop-cock at B, a second tube with a stop-cock at C, and a thermometer introduced at D. In working, the apparatus is filled with water; the tube C is attached to the vessels through which the gas is to be drawn; and the stop-cocks at C and B being opened, the weight of the water escaping at B acts as suction, and draws in the gas from the tube C and the attached bottles or other vessels. The thermometer at D denotes the temperature of the water, and subsequently gas, contained in the reservoir, while the upright turn of the tube B keeps any air from entering the reservoir by that route.—A more complicated form of A., but one which is much more convenient to experiment with, is that known as Brunners's A.; the principle of action, however, is the same.



Aspirator.

ASPLE'NIUM, a genus of Ferns, of the order or sub-order *Polypodiaceæ*. The species are numerous, and widely diffused both in the northern and southern hemispheres. Many of them are of great beauty; and the small size of some recommends them to cultivators of ferns who find themselves much limited as to space. Some of the species bear the English name *Spleenwort*, as *A. Trichomanes*, *A. viride*, *A. Adiantum-nigrum*, &c., having been formerly supposed efficacious in removing obstructions of the viscera. From the same circumstance the name A. (Gr. *a*, privative, and *splen*, the spleen) is derived. They have now fallen completely into disuse, but were at one time very much employed, chiefly in the form of a syrup like *Capillaire* (q. v.), and were administered not only in cases of cough, asthma, diseases of the liver, and cutaneous diseases, but even in stone and gravel. But perhaps none of them was so extensively used as the species which is styled in old books Common Spleenwort (*A. Ce'terach*), now the type of a distinct genus, and known as *Ce'terach officinarum*. Some of them, as *A. Trichomanes* and *A Adiantum-nigrum*, are frequently called Maidenhair. *A. Trichomanes* is a very beautiful little fern, common on rocks and old walls in Britain, and most parts of Europe, found also in some parts of Africa, and in North America. A very common British species, *A. Ruta-muraria*, is popularly known as Wall-rue.

ASS (*Equus Asinus*), a well-known quadruped, usually referred by naturalists to the same genus with the Horse (q. v.), but which it has recently been attempted to make the type of a distinct genus (*Asinus*), including all the solid-hoofed quadrupeds (*Solidungula* or *Equidæ*, see HORSE) except the horse itself. The distinction is founded on the short hair of the upper part of the tail and the tuft at the end of it, the darker stripes with which the color is marked, and the absence of the hard bony warts which are found on the hinder-legs of the horse, although the fore-legs exhibit warts in a similar position. The long ears of the A. are one of the characteristics of the species, but they are longer in domestication than in a wild state. It is usually also distinguished by a black cross over the shoulders, formed by a longitudinal and a transverse streak, the general color being gray; but when the general color is darker or lighter than usual, the cross is often less apparent, or to be observed with difficulty. The facial line is arched.

Some uncertainty still exists as to the origin of the domestic A.; a number of wild races having been described, some of which are perhaps, like the wild horses of America, the progeny of animals that have escaped from domestication. The probability, however, appears to be that the A. is a native of Central Asia, where it is found in a perfectly wild state, in Tatary, Mesopotamia, Persia, &c., on the banks of the Indus, and even to the southern extremity of Hindustan; but its range does not extend so far northward as that of the wild horse—a circumstance which may perhaps partly account for the inferiority of the domestic A. in northern climates. The wild A. is found both in mountainous districts and in plains; vast troops roam over the great Asiatic deserts, migrating, according to the season, in summer, as far northward as the Ural; in winter, southward to the borders of India.

It is fond of bitter and saline herbage, and of brackish water. It was first accurately described by Pallas, under the name *Koulan*, which it bears on the high steppes around the Caspian Sea. It was, however, well known to the ancients, and is called *Onager* and *Asinus sylvestris* by Pliny, who also mentions, under the name *Hemionus*, another species (*Equus Hemionus*), a native of the same regions, now called the *Kiang*, or the *Dziggethai*. The latter name appears to be of Turkish origin, and to signify Mountain A., but seems to be sometimes applied to the one of these species and sometimes to the other. This seems also to be the case with some of their other eastern names, as Kahur or Goor, and is a source of no little confusion.—The cross on the shoulders is less observable in the Koulan than it usually is in the domesticated A. It ought also to be mentioned that, in one remarkable particular, the domesticated A. agrees with the *Equus Hemionus*, and differs from the Koulan, the infra-orbital foramen of the skull being situated much lower. But the Kiang neighs like a horse, and the other *brays*. The harshness of the voice of the A. is ascribed to two small peculiar cavities situated at the bottom of the larynx.

The allusions to the wild A. in the Old Testament, and particularly in Job xxxix., naturally excite the surprise of readers acquainted only with the dull domestic drudge, the emblem of patience and stolidity; but to this day they are beautifully appropriate to the wild A. of 'the wilderness,' which has the 'barren land' or 'salt places' for its dwelling, and 'the range of the mountains' for its pasture.—The wild A. has a short mane of dark woolly hair, and a stripe of dark bushy hair runs along the ridge of the back from the mane to the tail. It has longer legs, and carries its

The Wild Ass.

head higher than the domestic A. Its troops have always a leader. It is a high-spirited animal, very fleet and very wary, trying to the utmost the powers of the hunter. It is a principal object of the chase in Persia, where its flesh is prized as venison is in Europe, and it is accounted the noblest of game. Xenophon, in his *Anabasis*, describes the wild A. as swifter of foot than the horse, and its flesh as like that of the red deer, but more tender.

The domestic A. is also, in Arabia, Persia, Syria, and other eastern countries, a much finer animal than as it is usually seen in Europe, although in Spain the favorable influence of a more genial climate upon its development is visible, perhaps also of better treatment, the A. being more highly valued. The A. is much used for riding in the East. From Judges v. 10, we learn that, at a very early period, the great were accustomed to ride upon white asses, and a preference is given to white asses in the East to this day. The A. has been domesticated from the earliest times; but it does not seem to have been introduced into Europe till a comparatively recent date. In Britain, it is employed chiefly by the poor, but might probably with advantage be much more generally employed than it is. Its price is scarcely one-twentieth of the price of the horse, and it can be kept at one-fourth of the expense, delighting in the coarse herbage which other animals reject, and satisfied with comparatively scanty fare. The obstinacy ascribed to the A. seems to be very generally the result of ill treatment; and

proverbial as it has become for stupidity, it is probably quite equal in intelligence to the horse.

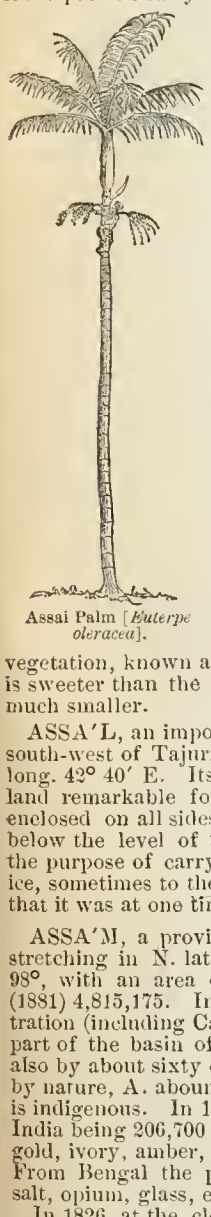
There are two hybrids between the A. and the horse—the MULE (q. v.), bred between the male A. and the mare; and the HINNY (q. v.), the offspring of the horse and the female A.

The milk of the A. contains more sugar of milk and less caseine than that of the cow, and therefore is recommended as a nutritious diet in cases of weak digestion. Its usefulness in cases of consumption has been long known, and it was often prescribed as a kind of specific when that disease was treated on principles very different from those which regulate its treatment now, and when very nutritious food was not usually prescribed to consumptive patients.

The leather called Shagreen (q. v.) is made by a peculiar process from the skin of the A., which also affords excellent leather for shoes, and the best material for drums. The bones of the A., which are very solid, were used by the ancients for making flutes.

ASSAB, an Italian trading station on the west coast of the Red Sea, near Bab-el-Mandeb. It was first acquired by a private company of Italians, but was taken over by the government of Italy in 1881.

ASSAI, a beverage very much used on the Amazon, prepared from palms nearly allied to the Cabbage Palm (q. v.). The most common species of A. palm is sixty feet high, with a smooth stem about four inches diameter. The fruit is small, in size and color resembling sloes, but is produced in great quantity upon branched *spadices*, which are thrown out horizontally beneath the crown of leaves. It consists of a hard seed, with a very thin covering of a firm pulp or flesh. The tree grows in swamps flooded by the high tides. Boys climb the trees for the fruit, upon which warm water is poured, and by rubbing and kneading, a liquid is procured, consisting simply of the pulp of the fruit and water, which is constantly vended in the streets of Pará, and of which the inhabitants are extremely fond. This is A. It is a thick, creamy liquid, of a purplish color, and a flavor like that of a freshly gathered nut. It is commonly used along with the bread made from Manioc (q. v.), called *farinha*, and either with or without sugar. Half the population of Pará make a daily meal of A. and farinha; and upon this hundreds are said chiefly to subsist.—The stem of the A. is sometimes used for poles and rafters, and its terminal bud as a cabbage or as a salad with oil and vinegar; but it is too much valued upon account of its fruit to be often cut down for these purposes.—Another species, *Euterpe Catinga*, is found in forests of a dry sandy soil and very peculiar vegetation, known as Catinga forests. The beverage made from it is sweeter than the common kind, but the produce of the tree is much smaller.



Assai Palm [*Euterpe oleracea*].

ASSA'L, an important salt-lake in the east of Africa, 25 miles south-west of Tajurrah, the chief seaport of Adel, lat. 11° 40′ N., long. 42° 40′ E. Its length is 8 miles; its breadth, 4. It lies in a land remarkable for its wild, waste, and sterile character. A. is enclosed on all sides but the east by hills, and is nearly 700 feet below the level of the sea. Abyssinian caravans resort to it for the purpose of carrying off the salt which incrusts its shores like ice, sometimes to the depth of half a foot. It has been supposed that it was at one time connected with the Bay of Tajurrah.

ASSA'M, a province at the N.E. extremity of British India, stretching in N. lat. from 24° to 28°, and in E. long. from 90° to 98°, with an area of 53,856 sq. miles. Pop. (1872), 4,132,019; (1881) 4,815,175. In 1874, it was formed into a separate administration (including Cachar) under a chief-commissioner. It forms part of the basin of the Lower Brahmaputra, and is intersected also by about sixty other rivers. Being thus irrigated, as it were, by nature, A. abounds in wood, and is very fertile. The tea-plant is indigenous. In 1880, A. had 150,000 acres in tea (the total for India being 206,700 acres). The other products are rice, mustard, gold, ivory, amber, musk, silver, iron, lead, petroleum, and coal. From Bengal the principal imports are woollens, India fabrics, salt, opium, glass, earthenware, tobacco, betel, &c.

In 1826, at the close of the first Burmese war, A. was ceded to the British. The upper portion of the province, however, was conferred, as a separate principality, on the native rajah, whom the Burmese had expelled; and it was only in 1838, that in consequence of his misgovernment, the entire country was actually placed under British administration. Since then, the province has exhibited a noticeable improvement, for which, considering that the population is only about 60 to the square mile, there is still, however, almost unlimited scope. The great evil is the prevalence of earthquakes, few months passing without a shock or two. The people, however, seem to think lightly of them—the only one that is specially remembered as being of extraordinary severity having occurred as far back as 1807.

A. is divided into thirteen districts. Gowhati and Sîlhat are the only towns of considerable size.

One of the most striking features of A. is the abundance of wild animals, such as tigers, rhinoceroses, leopards, buffaloes, and elephants. Of the elephants, not less than 500 are annually caught; and, when tamed, bands of them may be seen, harmless as cows, in the charge of a single attendant. The forests teem with game, and the rivers with fish.

ASSAS'SINS, a military order, a branch of the secret sect of the Ismaelites (q. v.). The secret doctrines of these Ismaelites, who had their headquarters in Cairo, declared the descendants of *Ismael*, the last of the seven so-called imaums, to be alone entitled to the califate; and gave an allegorical interpretation to the precepts of Islam, which led, as their adversaries asserted, to considering all positive religions equally right, and all actions morally indifferent. The atrocious career of the A. was but a natural sequence of such teaching. The founder of these last, Hassan-ben-Sabbah-el-Homairi, of Persian descent, and imbued with the free-thinking tendencies of his country, had, about the middle of the 11th c., studied at Nishpur, under the celebrated Mowasek, and had subsequently obtained from Ismaelite *dais*, or religious leaders, a partial insight into their secret doctrines, and a partial consecration to the rank of dai. But on betaking himself to the central lodge at Cairo, he quarreled with the heads of the sect, and was doomed to banishment. He succeeded, however, in making his escape from the ship, and reaching the Syrian coast, after which he returned to Persia, everywhere collecting adherents, with the view of founding, upon the Ismaelite model, a secret order of his own, a species of organized society which should be a terror to his most powerful neighbors. In 1090, Hassan conquered the fortress of Alamut, in the Persian district of Rudbar; and continued to increase in strength, intimidating princes and governors by a series of secret murders, and gaining possession of several fortified castles, with their surrounding territories, both in the mountain range south of the Caspian, in Kuhistan, and in the mountains of Syria (Massiat). The internal constitution of the order, which had some resemblance to the orders of Christian knighthood, was as follows: First, as supreme and absolute ruler, came the Sheikh-al-jebal, the Prince or Old Man of the Mountain. His vicegerents in Jebal, Kuhistan, and Syria were the three *Dai-al-Kibir*, or grand-priors of the order. Next came the Dais and Refiks, which last were not, however, initiated like the former, into every stage of the secret doctrines, and had no authority as teachers. To the uninitiated belonged first of all the Fedavies or Fedais—i. e., the devoted: a band of resolute youths, the ever ready and blindly obedient executioners of the Old Man of the Mountain. Before he assigned to them their bloody tasks, he used to have them thrown into a state of ecstacy, by the intoxicating influence of the *Hashish* (the hemp-plant), which circumstance led to the order being called Hashishim, or hemp-eaters. The word was changed by Europeans into Assassins, and transplanted into the languages of the West with the signification of murderers.

The Lasiks, or novices, formed the sixth division of the order, and the laborers and mechanics the seventh. Upon these, the most rigid observance of the Koran was enjoined; while the initiated, on the contrary, looked upon all positive religion as null. The catechism of the order, placed by Hassan in the hands of his dais, consisted of seven parts, of which the second treated, among other things, of the art of worming themselves into the confidence of men. It is easy to conceive the terror which so unscrupulous a sect must have inspired. Several princes secretly paid tribute to the Old Man of the Mountain. Hassan, who died at the age of 70 (1124 A.D.), appointed as his successor, Kia-Busurg-Omid, one of his grand-priors. Kia-Busurg-Omid was succeeded in 1138 by his son Mohammed, who knew how to maintain his power against Nuredin and Jussuf-Salaheddin. In 1163, Hassan II. was rash enough to extend the secret privilege of the initiated—exemption, namely, from the positive precepts of religion—to the people generally, and to abolish Islam in the Assassin state; which led to his falling a victim to his brother-in-law's dagger. Under the rule of his son Mohammed II., who acted in his father's spirit, the Syrian Dai-al-kebir, Sinan, became independent, and entered into negotiations with the Christian king of Jerusalem for coming over, on certain conditions to the Christian faith; but the Templars killed his envoys, and rejected his overtures, that they might not lose the yearly tribute which they drew from him. Mohammed was poisoned by his son, Hassan III., who reinstated Islamism, and thence obtained the surname of the New Moslem. Hassan was succeeded by Mohammed III., a boy of nine years old, who, by his effeminate rule, led to the overthrow of the order, and was

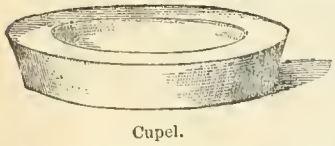
eventually murdered by the command of his son, Rokn-eddin, the seventh and last Old Man of the Mountain. In 1256, the Mongolian prince, Hulagu, burst with his hordes upon the hill-forts of Persia held by the Assassins, which amounted to about a hundred, capturing and destroying them. The Syrian branch was also put down about the end of the 13th c., but remnants of the sect still lingered for some time longer in Kuhistan. In 1352, the A. reappeared in Syria, and indeed they are still reported to exist as a heretical sect both there and in Persia. The Persian Ismaelites have an imaum, or superintendent, in the district of Kum, and still inhabit the neighborhood of Alamoot under the name of Hosseinis. The Syrian Ismaelites live in the district of Massiat or Massyad. Their castle was taken from them in 1809 by the Nossaries, but afterwards restored. See Hammer, *Geschichte der Assassinen* (Stutt. and Tüb. (1818); Guyard, *Fragments* (1874).

ASSAU'LT. In the sudden and vigorous attack of a fortified post, which is called an *A.*, the troops are told-off into 'storming-parties,' 'supports,' and 'firing-parties.' The storming-parties are those who take the most terrible duty, being that of making a forcible entry into the place. The firing-parties or musketeers seek to shield the storming-parties as much as possible from the fire of the enemy; they spread themselves out in extended order, to keep down the fire of the garrison—aiming at any soldier who may show his head above the parapet, and seeking to disable the artillerymen by firing into the embrasures. Many assaults are made by *surprise;* and in that case the storming and firing parties order all their preliminary movements as quietly as possible. In most cases, there is a necessity for the stormers to descend into a dry ditch, and to ascend from the ditch to a breach or a gate in the fortified wall. To aid in this duty, 'ladder-parties' are placed at the disposal of the storming-parties; these men have previously been practised in carrying scaling-ladders, descending and ascending ditches, and adjusting the ladders. In some celebrated sieges, ladders 40 feet long have been used, where the ditch was deep and the wall or bastion high; but it is seldom that a storming-party could venture on so perilous a work, for the men crowded on such a ladder would endanger each other. The 'supports' are troops who keep a little in the rear of the storming and firing parties.

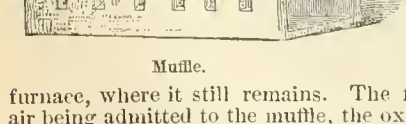
ASSAULT, in Law. See Beating and Wounding.

ASSA'Y, or ASSA'YING, is the process employed in determining the proportion of pure metal in a metallic ore or in an alloy. This method of analysis is more generally followed in the examination of compounds of silver and gold, but is likewise resorted to in the investigation of ores of iron, copper, tin, zinc, bismuth, antimony, mercury, and lead. In manufactured articles, also, such as silver-plate and gold-plate, some foreign metal (generally copper) is present, to impart hardness to the metal; and in Great Britain, each article is assayed at the Goldsmiths' Hall, previously to being sold, so as to determine the exact richness of the metal whereof it is made.

In the A. of compounds containing silver, the apparatus employed is a *cupel*—a small basin-shaped vessel of the form and size of the figure, made of bone-ash; and a *muffle*, composed of fire-clay, about 8 inches in length and 3 to 4 inches in diameter, shaped like a minature railway-tunnel, open at the one end, A, closed at the other end, B, and having numerous slits or air-holes, C, along the side. The more simple A. of silver consists in the examination of argentiferous lead ore. By a preliminary process, the sulphur is separated (see Lead); and weighed fragments of the mixed lead and silver being placed on cupels, the latter are introduced into the muffle, which has been previously heated in a furnace, where it still remains. The fire is then increased, and air being admitted to the muffle, the oxygen of the air unites with the lead, forming oxide of lead (PbO), which in part volatilizes through the openings in the side of the muffle, and in other part sinks into the porous bone-earth of which the cupel is made. Whilst the lead is thus carried away, the silver remains behind as a molten metallic globule, and when the last traces of lead-fumes leave the silver bead, the latter suddenly *lightens*, and immediately thereafter becomes brilliant and white. On being slowly allowed to cool, the globule of silver may be weighed, and the amount of pure metal thus determined. The use of the cupel during this process has led to the term *cupellation* being employed in place of A. When silver contains copper, which it does in ordinary coinage and silver-plate, it becomes necessary to mix lead with the alloy before attempting to separate the copper. The manner in which the lead is generally added is to roll the alloy of silver and copper in a piece of sheet-lead or lead-foil, and place the whole package on the cupel. During the heating in the muffle, the lead oxidizes as usual, and in part passing into the bone-earth of the cupel, carries the copper with it. The amount of lead required to effect the separation of copper from silver in this way is given in the following table:



Cupel.



Muffle.

Standard of Silver in One Part.	Amount of Copper Alloy in One Part.	Quantity of Lead Necessary for One Part of Alloy.	Quantity of Lead in Relation to that of Copper.
1000	0	$\frac{3}{10}$ part.	
950	50	3 parts.	60 to 1.
900	100	7 "	70 " 1
800	200	10 "	50 " 1
700	300	12 "	40 " 1
600	400	14 "	35 " 1
500	500	16 to 17 "	32 " 1
400	600	16 " 17 "	27 " 1
300	700	16 " 17 "	23 " 1
200	800	16 " 17 "	20 " 1
100	900	16 " 17 "	18 " 1
Pure copper.	1000	16 " 17 "	16 " 1

The metallurgic chemist, while performing an A, can determine, by the examination of the stains on the cupel after the process has been finished, what metal may have accompanied, and been separated from the silver, even in minute quantity. Thus, lead alone imparts a straw-yellow or orange stain; copper, a gray or dark-brown tint; and iron, a black stain.

During the A. of silver by the foregoing or *dry* method, a certain loss of metal generally occurs, which averages 2 parts in 1000; and this circumstance has induced the authorities in the mints of Great Britain, France, and other European kingdoms, as well as the United States, to adopt a *humid* process for the A. of silver, which will determine the value of a silver alloy to within 0·5 (or half a part) in 1000. The humid or wet A. consists in dissolving the compound of silver in nitric acid of density 1·25, and thereafter adding a solution of common salt (chloride of sodium, NaCl), which causes the precipitation of the chloride of silver (AgCl) in white flocculi. The common salt is made of a definite strength, and is poured out of a measured or graduated vessel, till all further precipitation of the silver ceases, when the amount required of the solution of common salt is read off, and by a simple calculation its equivalent in pure silver is obtained.

The A. of gold ores is conducted in a manner similar to that of silver. When the ore contains gold, lead, and copper only, it suffices to mix more lead with it, and heat in the cupel in the muffle furnace, when the lead and copper sink into the cupel, and the gold forms a globule on the upper surface. The proportion of lead required is regulated by the amount of copper present in the alloy.

Proportion of Gold contained in One Part of the Alloy.	Quantity of Lead necessary to completely remove the Copper by Cupellation.
1000 thousands	1 part.
900 "	10 parts.
800 "	16 "
700 "	22 "
600 "	24 "
500 "	26 "
400 " and under.	34 "

When the gold is accompanied by silver as well as copper, iron, and lead, it is necessary in the first place to subject the alloy to the A. process in the ordinary way, which gets rid of the copper, iron, and lead, but leaves the silver still incorporated with the gold. The weight of this residual button gives the combined weights of the silver and gold present in the alloy. The method of separating the silver from the gold is called *parting*, and consists essentially in acting on the alloy with hot nitric acid, which dissolves away the silver, forming the soluble nitrate of silver ($AgO.NO_6$), and leaves the gold undissolved. When the silver is present in small proportion, the gold assumes a protective influence, and keeps the nitric acid from acting on the silver; and to effect this separation satisfactorily, it is necessary that there should be about three parts of silver to one of gold. As that proportion does not occur naturally, or in any kind of manufactured gold-plate, it is requisite to incorporate some silver with it. This is generally accomplished by taking the proper quantities of gold and silver, wrapping them up in a piece of lead-foil, and heating on a cupel. The lead, during its disappearance from the heating vessel, causes the most intimate amalgamation of the silver and gold, which are left on the cupel as a metallic button. The latter, on being allowed to cool, is beaten out on an anvil with a smooth hammer, and is then passed through steel rollers, which yield a ribbon of alloy about the thickness of an enamelled address-card.

The ribbon of metal being coiled up, is technically called a *cornet*, and when introduced into the flask with nitric acid, the entire solution of the silver is accomplished, whilst the gold is left as a brown-colored spongy mass, of the shape and size of the cornet.

To give the metal the appearance and compactness of ordinary gold, the very friable metallic ribbon is gently transferred from the *parting glass* to a crucible by inverting the former into the latter; and the liquid wich runs in with the gold being poured off, the crucible and its contents are raised to a red heat in a furnace, when the gold recovers its beautiful yellow color and metallic lustre, and at the same time becomes soft and flexible. The gold is now pure, and in a fit condition to be weighed, and the amount obtained indicates the proportion of pure gold in the original alloy. As the quantity of silver which is required to be present during this process, in order that the *parting* by nitric acid may readily take place, is three parts of silver to one of gold, it is customary to call this department of a gold A. *quartation* or *inquartation*.

During the A. of silver or of gold, it is necessary to guard against any sudden increase or decrease in temperature. Independently of the probable loss of metal through the fracture of the cupels, it is found that when the final buttons of pure metal are obtained on the red hot cupel, if great care be not taken to cool the whole very slowly, the bead of gold or silver *spits*, and little portions are thrown off.

The mode of assaying gold now described cannot always be followed out in the examination of jewelery and other manufactured articles, as, though only a few grains are required for the A., yet the removal of such might entail the destruction of the article, and in such circumstances the *touchstone* is resorted to. This stone was originally brought from Lydia in Asia Minor, and consisted of a coarse-grained quartz saturated with bituminous matter, but black basalt and other stones are now employed for the same purpose. The manner of using the stone is to draw a streak upon it with the auriferous article; and from the color of the streak the richness of the gold can be very accurately determined by the practised assayer. The subsequent action of nitric acid on the golden streak serves still further as a means of determining the purity of the metal, as the acid readily dissolves the copper and silver, and leaves the gold. See Mitchell's *Manual of Practical Assaying* (5th ed., by Crookes, 1881).

ASSA'YE, a village in the N.E. of the Nizam's dominions, at the fork of the Juah and Kaitna. A. claims notice chiefly as the scene of the first great victory of the Duke of Wellington, then Major-general Wellesley, won on the 23d September 1803. The British troops in action were only about 4500, while the Mahrattas under Scindia and the rajah of Berar numbered 50,000, of whom 10,000 were commanded by French officers. 98 pieces of cannon, 7 standards, all the baggage, and a large part of the ammunition of the Mahrattas fell into the hands of the conquerors, whose military supremacy was soon acknowledged over a great portion of India. In 1851 a medal was struck in commemoration of the victory.

ASSEERGHU'R, a fort situated on an isolated mountain at the north-east angle of the presidency of Bombay, in lat. 21° 26′ N., and long. 76° 26′ E. Its elevation above the base of the mountain is estimated at 750 feet. Its extreme length and breadth are respectively 1100 and 600 yards; from the irregularity, however, of the outline, the area is computed at not more than 300,000 square yards, or somewhat less than $\frac{1}{10}$ of a square mile. With the exception of two avenues of ascent, both of them difficult and strongly fortified, the space is everywhere terminated by a carefully scarped precipice, varying in height from 80 to 100 feet. This formidable fastness has been twice taken by the British—first in 1803, and finally in 1819.

ASSE'MBLY (*assemblée*), in the conduct of an army, is the second beating of the drum before a march, at which the soldiers strike their tents if encamped, roll them up, and stand to arms.

ASSE'MBLY, GENERAL, in Scotland, Ireland, and the United States, denotes the highest court of the Presbyterian Church. It differs from the Anglican Convocation at once in its constitution and in its powers, representing as it does both the lay and the clerical elements in the church, and possessing supreme legislative and judicial authority in all matters purely ecclesiastical. The General A. of the Established Church of Scotland consists of representatives, clerical and lay, from all the presbyteries of the church. The royal burghs of Scotland also return elders to the General A. of the Established Church, and each of the Scottish universities sends a representative. The Assembly meets once a year, in the middle of May, at Edinburgh, and sits for ten days. Its deliberations are presided over by a Moderator, whose election is the first step in the proceedings, after a sermon by his predecessor. In former times, this office was sometimes filled by laymen: among others, in 1567, by George Buchanan. In modern times, the moderator is always a clergyman. 84 presbyteries, composing 16 synods, return members to the General A. of the Established Church of Scotland. Its relation to the state is represented by a royal commissioner, who exercises no function in the A. beyond that of adding by his presence the sanction of the civil authority to its proceedings. The other functionaries are a principal and a deputy clerk, both clergymen, a procurator, and an agent. All business not despatched during the session of the A. is referred to a commission, with the moderator as convener, which meets immediately after the dissolution of the A., and again quarterly. The General A. of the Free Church of Scotland, which has 16 synods comprising 73 presbyteries, and of the Irish Presbyterian Church, are similarly constituted, the principal point of difference being the absence of the royal commissioner. See PRESBYTERY, SYNOD, BARRIER ACT, &c.

ASSE'MBLY, NA'TIONAL (France). The States-general (q. v.), convoked by Louis XVI. of France, and opened May 5, 1789, consisted of the two privileged orders, clergy and nobles, and of the tiers-état or commons. The privileged orders refusing to join the third estate and deliberate in a common chamber, the latter, of its own authority, June 17, assumed the title of *Assemblée Nationale*, and the right to act in the name of France. The court attempted to annul this resolution in a royal sitting, June 23; but the deputies of the third estate, along with the liberal members of the other two orders, had bound themselves by oath not to separate until they had given France a constitution, and had declared every attempt at violence on the part of the court, treason. They refused to quit the common hall, and the court yielded, and commanded the nobles and clergy to join the National A. This was the beginning of the revolution, and the A. proceeded with astounding rapidity to metamorphose old France. The abolition of all privileges on the 4th of August was followed by that of hereditary jurisdiction, and of restraints on religion and the press, and by the declaration of the Rights of Man (q. v.). In February 1790, the monastic orders were suppressed, and all remnants of feudalism swept away; in March, *lettres de cachet* and the oppressive salt-tax were abolished; in June, all orders and titles of nobility. In July, non-catholics had the property confiscated from their ancestors restored; Jews were relieved from personal taxation; and game-laws done away. A decree of October 18 abolished the cruel criminal penalities of Louis XIV. In January 1791 all corporations and guilds were abolished, and free-trade introduced. In February, political rights were conceded to Quakers; in May, the customs at city gates were abolished; in June, the torture; the violation of the secrecy of letters was also declared criminal. In September, all citizens, of whatever color or religion, received political rights.

The principles on which the Assembly proceeded were the sovereignty of the people, the independence of the communes, the limitation of the royal power through a conditional Veto (q. v.), the separation of the political authorities, and the responsibility of ministers. Accordingly, the A., shortly after it was constituted, declared that to it alone, subject to the royal veto, belonged the legislative power. Several decrees, in September 1789, determined that the legislative body should form only one chamber, and should be renewed every two years; other decrees declared the king inviolable, and the throne inalienable. A decree of 7th November forbade the deputies to undertake the place of ministers; in December, the new organization of the communes was begun. January 1790, France was divided into departments; in April, trial by jury was introduced; in May, it was declared that the right of war and peace belonged to the nation alone, that is, to the A.

In regard to finance, which had been the immediate cause of the Assembly's being convoked, the reforms were equally thorough. It was decreed at the outset that taxes were to be apportioned and raised without regard to rank or person. Then followed the approval of a loan of 80 millions of francs. A decree of November 1789 ordered the publication of the public accounts; another in December established a national bank. In March 1790 appeared the first law sanctioning the sale of 400 millions worth of the national domains; and in April, another ordering the issue of *assignats* (q. v.) on the national property; in October, these assignats were declared to bear no interest. These measures were followed, in the beginning of 1791, by a series of laws regarding coining, taxation, encouragement to industry, revenue-management, &c. A committee of the A. appointed to reform church matters, made a complete overturn of the old ecclesiastical system. After a declaration that Catholicism had ceased to be the state religion, tithes were abolished, and church property confiscated. Church ornaments and valuables were appropriated as patriotic gifts to the state; the civil jurisdiction of the bishops was taken away, and monks and nuns were freed from their vows. The clergy were put under a civil constitution. Each department was a see, and the communes ruled and paid bishop and curés. All the clergy were amenable to the civil courts, without appeal to the pope or the interference of any ecclesiastical authority whatever. Every clergyman had to take an oath accepting this constitution, which led to the emigration of a number, and subsequently to enactments of excessive rigor against refractory priests (*prêtres insermentés*).

The A. having thus laid the revolution on a foundation of 3250 decrees, and having sworn to the new constitution, and got it accepted by the king, closed its sittings, September 30, 1791. From

its having framed the constitution (which lasted only 12 months), this assemby is usually called the Constituent A. It made way for the LEGISLATIVE ASSEMBLY, which was to reform the civil and criminal laws in accordance with the spirit of the new constitution. A decree had provided that no member of the Constituent should be returned to the Legislative A. But the democratic party received such preponderance at the elections, that the A. forgot its mission from the very first, and commenced a war with the remnants of the royal authority, which ended, August 10, 1792, with the overthrow of the throne and the suspension of the king. The constitution had provided for an appeal to the nation in extreme cases, and the Legislative A. now exercised that right by convoking a *National Convention* (q. v.), which, being invested with the powers of the sovereign, was to decide on the fate of the monarchy, and remodel the whole political system.

The title of National A. has been assumed by various other parliamentary bodies, originating in popular commotions, and aiming at radical political changes; as the French A. that met after the revolution of February 1848, followed, April 1849, by a Legislative A.; the German National A. at Frankfort; and the Prussian National A. Under the existing French Republic, the Senate and the Chamber of Deputies unite to form the National A.

ASSE'MBLY OF DIVI'NES, or WE'STMINSTER ASSE'MBLY, a celebrated convocation appointed by the Long Parliament for settling the doctrine, liturgy, and government of the Church of England. It consisted of 120 clergymen and 30 laymen—10 of whom were lords and 20 commoners—together with 4 clerical and two lay commissioners from the Church of Scotland. Among the more distinguished of the divines were Usher, Saunderson, Reynolds, Brownrigg, Ward, Twisse, Lightfoot, Gataker, Burges, Goodwin, Calamy, and Nye; of the laymen, Selden, Prideaux, the two Vanes, Rouse, Pym, Whitelocke, St. John, and Maynard. The Scottish divines were Henderson, Gillespie, Rutherford, and Baillie. 25 of those whose names were contained in the ordinance calling the Assembly, which was dated 12th June 1643, never appeared at the discussions, one or two of them having died about the time of the first meeting, and the others fearing the displeasure of the king. To supply the place of these absentees, some additional members, called the superadded divines, were summoned to attend. This notable Assembly held its first meeting on the 1st of July 1643, and continued to sit till the 22d February 1649, during which time it had met 1163 times. Its most important work was concluded long before that time. One of the first things it did was to give its sanction to the *Solemn League and Covenant*, against which Dr. Burges alone stood out for several days. The Presbyterians formed a large majority in the Assembly, and exercised a corresponding influence on its decisions. In doctrine, the members were almost unanimous; but on the subject of church government, opinions extremely opposite were maintained with keenness, especially on the question touching the sphere and limits of the civil power in matters ecclesiastical. The principal fruits of its deliberations were the *Directory of Public Worship*, submitted to parliament April 20, 1644; the *Confession of Faith*, October and November 1646; the *Shorter Catechism*, November 5, 1647; and the *Larger Catechism*, September 15, 1648. These several formularies, which contain a clear and rigid embodiment of Calvinistic theology and Presbyterian church government, constitute to this day the authorized standards of the Presbyterian churches of Scotland, Ireland and England. The *Directory of Public Worship* was ratified by both Houses of parliament, October 2, 1644, and the doctrinal part of the *Confession of Faith* in March 1648. An order of the House of Commons, October 13, 1647, ordained that the Presbyterian form of church government should be tried for a year, but no further legislation followed. What has hitherto been known as to the details of the proceedings of this remarkable convocation, has been derived chiefly from the *Letters* of Baillie, and Lightfoot's *Journal*.—See Hetherington's *History of the Westminster Assembly* (1843); and the 2d volume of Masson's *Life of Milton*, published in 1871 (pp. 509—527), where a list of the members, with brief biographic notices, is given. See CREEDS AND CONFESSIONS.

ASSE'NT, RO'YAL, is the regal act by which the sanction of the crown to bills which have passed through both Houses of parliament is given. See ROYAL ASSENT.

ASSER, JOHN, the learned and congenial biographer of Alfred, was a monk of St. Davids, from the Latin name of which, *Menevia*, he is termed in the old records *Asserius Menevensis*. About the year 880, his reputation for learning and piety procured him an invitation to the court of Alfred, where he resided at intervals during the rest of the king's life, assisting him in his studies, and enjoying an affectionate confidence, of which he seems to have been every way worthy. The king promoted him to various dignities, and finally made him Bishop of Sherburn. The *Saxon Chronicle* fixes the date of his death to the year 910. Several works have, with more or less authority, been attributed to A. The only one undoubtedly his, by which we can now judge of him as a man and a writer is his *Annales Rerum Gestarum Aelfredi Magni*. This simple and most interesting narrative was first published in 1574 by Archbishop Parker. Its trustworthiness has recently (1842) been questioned by Mr. Thomas Wright, in the article 'Asser' of his *Biographia Britannica Litteraria*. This gentleman has assuredly made the most of the objections to its reliability that can be legitimately urged. Lingard and Dr. Pauli have replied to these, and, at present, the general impression of scholars of Anglo-Saxon literature is that there is no good reason for doubting its general accuracy and fidelity. The best edition is that of Wise (Oxf. 8vo. 1722).

ASSESSED TAXES are charged on the people by a somewhat cumbrous system, papers being distributed to be filled up by the taxpayer, or, when the tax is of a specific amount, intimating the sum to be paid. The most notable instances are the income-tax, house-duty, and the local rates. This mode of collecting requires a whole army of assessors and collectors for determining and collecting the amounts due. Hence for many of the old assessed taxes, *excise licenses* have now been substituted, as in the case of the dog-tax, the taxes on armorial bearings, carriages, male-servants, and the game-license, and liquor and eating-house licenses. The simplification in the dog-tax is evident: the taxpayer simply takes out a license at the nearest post-office. The A. T. are under the management of commissioners of Inland Revenue. See TAXES.

ASSE'SSORS are persons sometimes associated with judicial functionaries, to assist in the argument and procedure before them, and to advise their judgments. They may be usefully employed by persons in judicial stations whose previous education and pursuits scarcely qualify them for the duties cast upon them. A. are usually barristers or advocates learned in the law, and familiar with judicial proceedings. By the Municipal Corporation Act, it is enacted that the burgesses shall annually elect from among those qualified to be counsellors, two auditors and two A., the former to audit the accounts of the burgh, and the latter to revise the burgess list. In the ecclesiastical law of England, a bishop, who is a spiritual judge, is assisted by his chancellor, as the episcopal assessor, and who, in fact, holds court for the bishop. But in the case of a complaint against a clergyman for any ecclesiastical offence under the Church Discipline Act (the 3 and 4 Vict. c. 86), the bishop is directed to inquire into the matter, assisted by three A., of whom the dean of his cathedral, or one of his archdeacons, or his chancellor, must be one, and a serjeant at law, or an advocate who has practised five years in the court of the archbishop of the province, or a barrister of seven years' standing, another.

The judges of the common law courts, and the Queen's counsel, being serjeants, are, as a condition of their offices, A. of the House of Lords, advising the House on points of law which may be propounded to them by their lordships.

A'SSETS. This is one of those terms in the law of England which in itself bears evidence of a Norman origin. It is derived from the French word *assez*, or more exactly, in Norman-French, *assetz*, 'enough' or 'sufficient,' signifying the property of a deceased person, which is sufficient in the hands of his executor and heir for the payment of his debts and legacies. In strictness, therefore, the term is not applicable to the property of a person who dies intestate, and without any debts to be paid. In general acceptation, however, it is understood to mean the property left for distribution by a deceased person, whether testate or intestate; and in commerce, and also in bankruptcy and insolvency, the term is used to designate the stock in trade and entire property of all sorts belonging to a merchant or to a trading association.

A. are either *personal* or *real*, the former comprehending such goods, chattels, and debts as devolve on the executor; and the latter including all real estate, whether devised or descending to the heir at law. In connection with this distinction, A. are also said to be *A. by descent*, and *A. in hand*, the former of these being recoverable from the heir to whom the land descends, and so far as such lands will extend—A. in hand, again, signifying such property as a person leaves to his executors sufficient for the clearing of burdens and bequests affecting his personal estate. A. are also in their nature either *legal* or *equitable*, according to the nature of the remedy which may be used by creditors against the executor or heir. Where there are several creditors of equal degree, the executor is bound to pay him who first obtains judgment for his debt; and he cannot resist on the ground that nothing will be left for the other creditors. If, after exhausting the whole A. which have come to his hands, by the payment of debts in due order, he be afterward sued by a creditor remaining unpaid, he is entitled to protect himself by an allegation that he has fully administered, or technically by a plea of *plene administravit;* and upon this plea the creditor is entitled to judgment that he shall be paid out of any other A. that shall come to the defendants, which is called a judgment of A. *in futuro*.

A. is not a technical term in Scotland, but it is nevertheless much used in the legal business of that country.

ASSI'DIANS. See CHASIDIM.

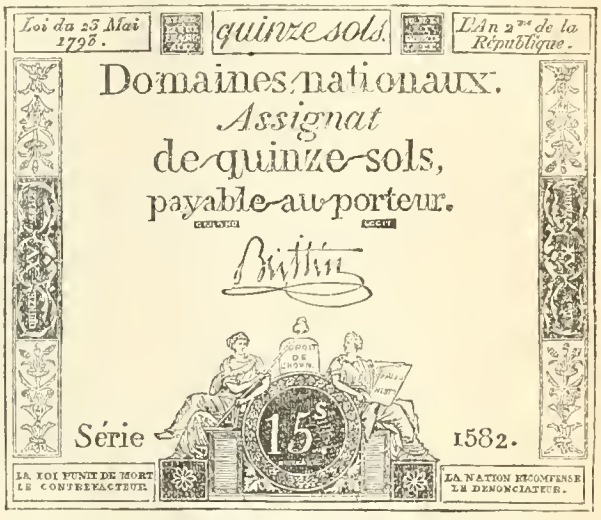
ASSIE'NTO, i.e., treaty, a word specially applied to a compact between Spain and some foreign nation, according to which the Spanish government conferred upon the latter, under certain conditions, the monopoly of the supply of negroes for its American colonies. It was Charles I. of Spain who first concluded an A. with the Flemings. Next, a similar compact was entered into with the Genoese (1580 A.D.), the Portuguese (1696), and on the accession of Philip V. to the Spanish throne in 1702, with the French Guinea Company, which from that time took the name of A. Company, upon the understanding that for ten years it should have the exclusive right of annually importing 4800 negroes of both sexes to the continent and islands of Spanish America. The A. was next transferred to England at the peace of Utrecht in 1713, and made over by government to the South Sea Company for 30 years, permission being also granted to the company to send yearly, during the term of contract, a ship, carrying 500 tons of goods, to these Spanish colonies. The misunderstandings that grew out of this last clause contributed not a little to the war that broke out between the two nations in 1739. At the peace of Aix-la-chapelle in 1748, the English company having still four years to run, their rights were guaranteed to them; but they relinquished them at the Madrid Convention of 1750, upon the payment of £100,000, and the concession of certain commercial advantages.

ASSI'GN, To, in Law, signifies to transfer or grant over to a third party a security, a right of credit, or other right, whether in possession or in reversion, granted by a party indebted or under obligation to the party assigning. The words of assignment are to *A.*, *transfer*, and *set over*, and they operate to transfer both real and personal property. A *Chose in Action* (q. v.), contrary to the ancient principle, can now be assigned in England indirectly by the common law, and directly according to the principles recognized in the practice of equity. Besides this general application of the word, as a technical term in conveyancing, both in England and Scotland, it is also employed in England in judicial procedure, where the decision of an inferior court is brought under review, and in proceedings in bankruptcy. See ASSIGNMENT, ASSIGNATION, ASSIGNMENT OF ERROR, BANKRUPTCY.

ASSIGNA'TION is a legal term in Scotch conveyancing, analogous to the English word Assignment (q. v.), by means of which the holder of any right, or the creditor in any obligation, or the proprietor of any subject not properly feudal (see FEUDAL SYSTEM), transfers his right or estate to a third party. The party making the A. is called the *cedent*, and the party in whose favor the A. is made is called the *assignee* or *cessionary*, and the act of assignment thus made is irrevocable, an element in the deed which has been traced to the practice of the French law, a source from which the Scotch lawyers of the 16th c. borrowed so much—the Court of Session itself being a mere copy of the Parliament of Paris. A direct conveyance of a debt in France was termed *un transport;* the granter, *cédant;* and the grantee, *cessionnaire;* and these terms, derived from a Latin origin, were introduced into the Scotch law; and hence the names of the parties to an A., as we have stated. Unlike the English common-law view of the assignment, the Scotch A. has the effect of investing the assignee with the whole right, which was in the cedent, although, according to the ancient practice, the A. gave, not simply the sum or subject assigned, but also the deed or written evidence of the right or thing assigned, a form arising from the circumstance of the instrument having been regarded as of the nature of a mandate or power of attorney to the assignee to make his claim and to act as in right of the cedent. In modern practice, however, it is usual to employ simply the terms 'assign, convey, and make over,' which correspond with the real character of the deed. In order, however, to complete the A., it must be *intimated* to the common debtor—that is, the party originally indebted to the cedent—and so essential is this intimation, that in the case of competing claims against the right interest or estate assigned, the A. first intimated will be preferred to one prior in date, but posterior in the date of intimation. Such intimation ought to be made by a *Notary Public* (q. v.), but other formal notice of the A. is sometimes admitted. But there are certain assignations which require no intimation, such as the endorsement of bills of exchange, adjudication (q. v.), which is a judicial A., and marriage, which is a legal A.; and the same is the rule with regard to all right and estate assigned under the operation of the bankruptcy laws. In Scotch agricultural leases, assignees are generally excluded expressly.

But although A. is the strict Scotch term for assignment, the latter is in Scotland the technical term for the transference of certain property, such as property in copyrights, patents, and registered vessels.

A'SSIGNATS. After appropriating to national purposes the land belonging to the church, the French National Assembly (see ASSEMBLY, NATIONAL), instead of bringing it into the market at a time of insecurity, when its value was depreciated, issued bonds on the security of it, which were called *assignats*, as representing land *assigned* to the holder. This paper-money consisted chiefly of notes for 100 francs (£4) each, though many of them were for sums as low as ten or five francs, and even lower; and the first issue amounted to 400 million francs. The first A., which were issued in the spring of the year 1790, bore interest; but subsequent issues did not. The facility of this plan of providing government income led to its being repeatedly had recourse to, as the property of wealthy emigrants—persons who abandoned their country in alarm—fell into the hands of the rulers, and was confiscated, till the amount rose to the enormous sum of 45,578 million francs, besides a great number of forged A. manufactured



Fac simile of Assignat.

abroad, and smuggled into the kingdom. The value of the A. naturally soon began to decline, and confidence once gone, the declension became fearful. In June 1793, one franc in silver was worth three francs in paper; in August, it was worth six. The state took the most extreme measures to compel the acceptance of A. at their full nominal value. The effects of these were to cause the A. to flow back into the public treasury, to raise the prices of all commodities, and to make every one averse to have any dealings with the state. One of these consequences was attempted to be met by fixing a maximum of prices. But no one could compel producers and dealers to produce and sell at a loss; so that all business became disorganized. At last the value of A. came almost to nothing. Millions of individuals had suffered incalculable loss, and only a few who had bought public lands with the A. that cost them little or nothing, had enriched themselves at the expense of the community.

In March 1796, a louis d'or (24 francs) brought 7200 francs in A. After this, they were withdrawn from the currency in 1796, and redeemed, at $\frac{1}{30}$th of their nominal value, by *mandats*, a new kind of paper-money, which enabled the holder at once to take possession of public lands at the estimated value while A. could only be offered at a sale. The mandats also soon fell to a seventieth of their nominal value, and were returned to government in payment of taxes or of land.

At length, in July 1796, the system of paper-credit, so obstinately persisted in by government and so disastrous in its results to the public, came to an end. A law was passed, declaring that every one was entitled to transact business in whatever circulating medium he pleased; that the mandats should be taken at their current value; and that the taxes be received either in coin or mandats at that rate. The A. were executed on a coarse kind of paper, and, as will be seen by the accompanying fac-simile, the devices were so meagre as to be easily counterfeited.

ASSIGNEE' IN BA'NKRUPTCY. See BANKRUPTCY.

ASSI'GNMENT, in the law of England, is the name given to a conveyance by which the party making the A. transfers or grants over, for a sufficient consideration, a right in expectancy, in reversion, or other right not in possession, such as a bond, a debt, or other *chose in action* (q. v.). In England, according to the strict rule of the old common law, no such right could be assigned or granted over, because such a proceeding was thought to be an encouragement to litigation. The only exception to this general rule was in the case of the crown, which might always either grant or receive a *chose in action* by A. Now, however, the proceeding is in constant practice. The courts of equity used to make the rule itself give way to the expediency of facilitating the transfer of property by directly sanctioning the practice; and even in those of common law the application of the ancient principle was evaded. Mortgages may be assigned; indeed the right to make such a trans-

fer is one of the properties of a mortgage security. A. is also the proper mode of assurance or conveyance for passing leasehold estates for years, and other chattel property; and by the 8 and 9 Vict. c. 106, s 3, it is enacted that all assignments made after the 1st of October, 1845, not being an interest which before the passing of the act might have been created without writing, shall be void at law, unless made by deed. But a mere note in writing, if duly signed by the parties, will nevertheless be supported in equity as an agreement, and pass an equitable interest to the assignee. It also appears that a patrol or verbal lease for a term not exceeding three years, nor valid as such within the Statute of Frauds (q. v.), may be assigned by a simple note in writing, if impressed with a proper stamp. Copyright is assignable; indeed, by the 5 and 6 Vict. c. 45, s. 3, copyright is expressly given to the author *and his assigns;* but it is not required, like a patent right, to be in every case under the seal of the proprietor, it being enacted by section 13 of the same act that an A. properly entered in the book of registry at Stationers' Hall shall be as effectual as if made by deed.

In regard to the right of A. generally, it may be laid down that the property in things personal is transferable with absolute freedom; and if they are assigned under a condition which is either repugnant to the gift itself, or against the policy of the law—such as a prohibition to dispose of the property assigned—the condition is void. There are some cases, however, where the right of alienation is, in respect to the incapacity of the owner, suspended; as to which it will be sufficient to remark that the law with respect to the disability of infants, insane persons, and persons under duress, applies in general to personal as well as to real property. A married woman, too, is in general under an absolute incapacity to make any transfer of things personal; for, with the exception of her equitable interest in property settled in trust expressly for her separate use, the goods and chattels which she may have possessed at the time of marriage, or subsequently acquired, belong, by the general rule of law, to her husband. There are also some few cases where, in respect of the nature of the interest itself, its alienation is absolutely prohibited. Thus, generally, the pay or half-pay of a military or naval officer, or the salary of an officer of trust, is, on a principle of public policy, not assignable, the object being to secure to such persons, even against their own improvidence, the possession of those means which are essential to the maintenance of their station and the performance of their duties. The sale or transfer of public appointments themselves is also, in general, contrary to the policy of the law, and in most cases expressly prohibited. See Stephen's *Commentaries*, vol. ii. p. 43.

An A. of goods and chattels is frequently made by a Bill of Sale (q. v.). Bills of Exchange (q. v.) and Promissory Notes (q. v.) are assigned by endorsement.

The corresponding term in the Scotch law is *Assignation* (q. v.). But in that system, A. is the legal and technical word for the transference of property in copyrights, patents, and registered vessels. See ASSIGNMENT in AM. SUPP.

ASSI'GNMENT OF ERROR. See ERROR and APPEAL.

ASSI'GNS, or in Scotch law, ASSIGNEES, is the legal name given to parties in whose favor an Assignment or Assignation (q. v.) is made.

ASSIMILA'TION. See NUTRITION.

ASSINIBOIA, a Canadian district or territory within the limits of the North-west Territories, but formed by an order in Council in 1882. It lies to the west of Manitoba, is bounded on the south by the United States frontier, west (at 111° W.) by Alberta territory, north (at 52° N.) by the new territory of Saskatchewan. It has an area of about 95,000 sq. miles; is intersected by the Canadian Pacific Railway, by the Qu'appelle, South Saskatchewan, and Souris rivers; and contains the towns of Regina (new capital of the north west), Fort Pelly, and Fort Ellice.

ASSINIBOI'NE, a river of British North America, rising in lat. 51° 40′ N., and about long. 105° E. At Winnipeg it joins the Red River (q. v.), which discharges its waters into Lake Winnipeg. At a point 140 miles from its mouth, the A. is 230 feet broad; its course measures about 400 miles. The river gives name to a tribe of Indians.

ASSI'SI (*Assisium*), a town of Central Italy, is built upon a steep hill, 13 miles S.E. of Perugia. Pop. 6200. It stands in a singularly picturesque situation, and is surrounded by a wall flanked with towers, and overhung by lofty citadel in ruins. It is the birthplace of St. Francis, who here founded the Convento Sacro, the first monastery of the Mendicant order that bears his name, a large and beautiful structure, and one of the earliest specimens of the Gothic style of architecture in Italy. The church and the galleries of the monastery contain fine paintings by Cimabue, Giotto, and other old masters. Besides the Convento Sacro, there are eleven other monasteries in A. Of these, the largest is the Portiuncula, which has a richly decorated church, with a cupola by Vignola. In the last century, this place was a great resort of pilgrims, visiting the tomb of the saint, of whom one hundred thousand are said to have been assembled here on one day.

A. occupies the site of the ancient Assisium, a municipal town of Umbria, and presents the remains of the forum, the baths, and the aqueducts of the days of the Romans. In the piazza, or square, there stands a beautiful portico of the ancient temple of Minerva, consisting of fluted Corinthian columns and a pediment. There are abundance of olive-trees, and some fine mineral springs in the vicinity. The town has given title to a bishop since 240 A.D. It has manufactures of needles and files.

ASSI'ZE. This word, literally signifying a 'sitting' or 'session,' is a term used in the principal European legal systems, and very much in the same sense, or rather senses in all, for it has more than one distinctive meaning. As is common with regard to most of our ancient legal technicality, the Latin language, in the first instance (*assideo*), and then the French (*assis*), appear to have led to its introduction into the phraseology of the law of England, and, it may be added, also of Scotland, although in the latter country it has a more limited application in judicial procedure than in England, *A.* being in Scotland the old technical expression for a jury. In England, this word may also signify a jury, and it is sometimes used to denote an ordinance, decree, or law. But in modern practice, it is commonly applied to the sessions or sittings of the judges of the superior law-courts, held periodically in each county, for the purpose of administering civil and criminal justice. These courts came into use in room of ancient justices in eyre, *justicia rei in itinere*. They are now appointed by commissions issued twice a year to the judges of the High Court of Justice, two judges being generally assigned to each circuit. (These are the *general* commissions; *special* commissions are occasionally granted to certain judges to try certain causes and crimes.) By accompanying writs of *association*, certain persons are directed to be associated with the justices and serjeants, in order to take the assizes, &c., that a sufficient supply of commissioners may never be wanting. But, to prevent the delay of justice by the absence of any of them, there is also issued, of course, a writ of *Si non omnes*, directing that, if all cannot be present, any two of them (a justice or serjeant being one) may proceed to execute the commission.

These commissioners or judges of A. are sent twice in every year on *circuits* all round the kingdom, to try by a jury of the respective counties the truth of such matters of fact as are then under dispute in the courts of Westminster Hall; and occasionally a third circuit is appointed in the course of the year, for the purpose of jail delivery. The circuits (formerly eight) are, since 1875, seven in number—Northern, North-eastern, Midland, South-eastern, Oxford, Western, and North and South Wales; and in going them, the judges or commissioners sit by virtue of four several authorities: 1. The commission of the *peace;* 2. A commission of *oyer* and *terminer;* 3. A commission of general *jail* delivery. The other authority is, 4. That of *nisi prius*, which is a consequence of the ancient commission of A. being annexed to the office of justices of A. by the statute of Westminster the second (13 Edw. I. c. 30); and it empowers them to try all questions of fact issuing out of the courts at Westminster that are then ripe for trial by jury. These, by the ancient course of the courts, were usually appointed to be tried at Westminster in some Easter or Michaelmas term, by a jury returned from the county wherein the cause of action arose; but with this proviso, *nisi prius*, unless before the day prefixed the judges of A. should come into the county in question, which in modern times they have invariably done in the vacations preceding; so that the trial has always, in fact, taken place before those judges. And now, by the effect of the statue 15 and 16 Vict. c. 76 (the Common Law Procedure Act, 1852), the course of proceeding is no longer even ostensibly connected with a proviso at nisi prius, but the trial is allowed to take place without the use of any such words in the process of the court, and as a matter of course, before the judges sent under commission into the several counties. The circuit system, however, does not extend to London and Middlesex, which have instead courts of nisi prius, which are held before the chief or other judge of the superior courts for the trial of civil causes, at what are called the London and Westminster Sittings; and the establishment of the Central Criminal Court (by the 4 and 5 Will. IV. c. 36, the jurisdiction of which was extended by the 19 and 20 Vict. c. 16) has sufficiently provided for the administration of criminal justice within these districts. The Judicature Act (1873, ss. 11, 16, 29, 37, 77, 93 and 99) made no important alteration in the manner of holding assize.

The circuit courts of Justiciary in Scotland, of which there are three—the North, the West, and the South—very much resemble the assizes in England, and have, in criminal matters at least, very much the same jurisdiction; but in civil causes their authority is very limited.

In the sense of an ordinance or law, the term A. has various applications, although chiefly in the more ancient systems of jurisprudence. Thus, the 'Assizes' of Jerusalem were, as we are told

in Gibbon's *Decline and Fall* (vol. xi. p. 93), a code of feudal laws for the kingdom of Jerusalem, formed in 1099 by an assembly of the Latin barons and of the clergy and laity under Godfrey of Bouillon. Then there were the 'Assizes' or ordinances regulating the price of bread, ale, fuel, and other common necessaries of life, but all of which have been abolished. The same regulations appear to have prevailed in Scotland in ancient times. See JURY TRIAL, FAIRS.

ASSOCIATE SYNOD, ASSOCIATE PRESBYTERY, &c., designations adopted among the dissenters from the Church of Scotland. See UNITED PRESBYTERIAN CHURCH. America has also an Associate Synod and an Associate Reformed Church, both sprung from the Scottish Secession.

ASSOCIA'TION. See CO-OPERATION; also, SOCIETIES, LEAGUE, COMPANY.

ASSOCIA'TION OF IDE'AS. This is a phrase of great importance in the Philosophy of the Human Mind, as expressing the most pervading fact at the foundation of our intelligence. By giving, therefore, a somewhat full exposition of this subject, we are able to explain, at once, a considerable number of the complex phenomena of mind in a more satisfactory way than by treating the several phenomena separately. What is meant by Association of Ideas, is familiarly illustrated by such occurrences as the following: When we see the sky becoming overcast, we think of rain as about to follow, the notion of rain not having previously been present to our mind. When we hear the church-bells, we are apt to think of the crowds in the street, or of some of the other circumstances of public worship. When we pass a house, we are reminded of its occupier; and meeting a person we know, we may be carried in thought to his office, and from that to other persons holding the same office, and so on. If an object is before my eyes, as a mountain, I am said to receive an impression or sensation of it, in consequence of the actual presence of the thing; but it is possible for me to remember the mountain, or to have an idea of it, when far away from the reality, in which case there must be some power in the mind itself, different from the susceptibility to present objects, a power of retaining, reviving, or resuscitating those states at first induced by contact with the actual. Besides the sights, and sounds, and touches caused by contact with real things, we are greatly occupied with sights, sounds, and touches remembered, anticipated, or imagined, which is to live in a world of ideas; and it is in this world that the process termed Association has its sphere. When an idea is brought before the mind without its original, as when I picture to my mind the late Duke of Wellington, the circumstance is owing to the mention of his name, or of some incident connected with him; and my remembrance of his personal appearance, as I have seen him when alive, is said to be the result of an association existing in my mind between two ideas, so that one is able to recall or restore the other. The association between names and things comprehends one of the most extensive applications of the power in question.

The circumstances under which one idea brings forward another into the view are principally these two—viz., first, previous *proximity;* and second, *likeness.* The term 'Contiguity' and 'Similarity' are used in Mental Philosophy to express them. The first is exemplified in the examples of association given above; for in most of those it will be found that the conjoined notions have been frequently in the view at the same time, in consequence of which they have, as it were, grown together, or become part of the same whole. Thus, we have often noticed the darkened sky followed by a shower; the two facts have occupied the attention simultaneously, and in virtue of some power belonging to our mental framework, they have cohered into an inseparable couple or aggregate in the mind. This is proximity, or contiguity. When one idea suggests another which was never in company with it before, it is generally through the force of some *likeness* between the two. I meet an old man in the street with a very peculiar face, which reminds me of the bust of Socrates. These two things had never accompanied one another in my mind before, and therefore it could not be the force of proximity that made the second to arise at the instigation of the first; but there was a certain amount of likeness or similarity between the old man's features and the features of Socrates, as represented to us in the bust; and it is a fact of our constitution, no less certain and no less important than the foregoing, that in cases where something now before the mind has a strong cast of resemblance to something formerly observed or conceived by us, but not at present thought of in any way, the present is apt to recall that past idea, whatever it may be. By the force of likeness, the traveler in new countries is constantly reminded of the scenes and objects familiar to him, and so is induced to draw comparisons between the one and the other. Identification and comparison both imply that things are brought together by virtue of their similarity, they not having been in company before. The principle of proximity operates most in Memory, Habit, and Routine; similarity has to do with invention and originality, and is essential to the processes of Reason and Imagination.

Law of Contiguity.—The principle of association by proximity is not confined to ideas. We must state it in a more comprehensive form, in order to comprise the full sphere of its application; for our mechanical habits are formed through the very same power of our constitution that enables us to recall or remember ideas. The taught movements of a soldier or of a skilled workman are connected together so firmly that one succeeds to another almost of its own accord. Everything of the nature of acquisition supposes a plastic property in the human system, giving permanent coherence to acts that have been performed together.

The following is a general statement of the law under consideration:

Actions, Sensations, States of Feeling and Ideas, occurring together, or in close succession, tend to grow together, or cohere in such a way that when any one of them is afterwards presented to the mind, the others are apt to arise.

And first, as to association of Actions, or voluntary movements. When we perform a train of movements without any further aid of the will than to commence the series, there must be a fixed connection between each and the one that follows, and the connection may be either instinctive or acquired. There are various cases of instinctive trains, such as the action of the heart, lungs, and intestines, and the movements of deglutition. When a morsel of food reaches the back part of the mouth, the muscles of the throat seize hold of it, and transmit it to the stomach, independent of our will. The connected movements in this case are provided for in the original structure of the nervous and muscular system. In walking, there is partly an instinctive tendency to alternate the limbs, and partly a confirming acquisition, the result of practice. But in those complicated operations that human beings are taught to execute in the various avocations of life, the associating principle is everything. The apparently simple and easy act of taking food is a complicated acquisition; in other words, an extensive group of associated movements. The seizing of the morsel is followed by the movement of the arm that carries it to the mouth; the mouth is opened simultaneously; after which follows the processes of biting and chewing; all which take place with the certainty of a machine, and without effort or attention directed to them. These associations were originally built up by slow degrees. 'As a general rule, it takes many repetitions to cement so firm a union between successive and simultaneous movements as is implied in the above instance.'

A good example of the association of movements is furnished in our acquirement of spoken language, as in committing to memory words, sayings, and passages of books. When a child has perfectly acquired the Lord's Prayer, the chain of association is so firmly knit, that the articulation of the words 'Our Father' is followed irresistibly with those next succeeding, and so on to the end. The cohesion in this case is between the vocal movements corresponding to the enunciation of the words. Having gone many times through this one definite succession, the stream of nervous power, in some way that we cannot at present explain, acquires a tendency to fall into this one definite track, and in future to bring on the movements in the exact order that they have so frequently followed.

It is not merely actual movements that can be joined together in this way, but the *ideas* of movement; for a man, meditating in language, and not speaking out his thoughts, can consolidate his trains so as to remember them afterwards.

When we proceed to Sensations and the Ideas, or subsequent traces, of Sensations, and take along with these the variety of our movements with their ideas, we find an unlimited scope for the associating principle; and the consequences of its operation spread far and wide in the domains of our happiness, our knowledge, and our active capacity. It is only possible here to present a few illustrative examples.

In the various mechanical acquirements, which include the whole of special handicraft industry and skill, as well as the use of the bodily members in the more general actions of daily life, there may be traced the linkings of actions with actions, or actions with sensations and ideas. The helmsman steering a ship associates in his mind each deviation of the needle from the proper point with the specific muscular exertion to be applied to the wheel to rectify the ship's direction. The workman fabricating in wood, metal, or stone, acquires a firm connection between each aspect of the material and the muscular power to be applied to bring it one step nearer the desired form. The power of copying anything we see, as in writing, drawing, moulding, &c., when completely mastered, is made up of associations between a visible appearance, and the train of movements calculated to reproduce it. After practice, all this is done, as it is called, mechanically, or without those operations of considering, willing, and remembring directions, that are essential to the learner in a new art. The associations that grow up after a certain amount of practice, are in this case associations between movements and appearances to

the eye, or sensations of sight. In the greater number of crafts, the eye is the guiding sense to the operator, but not in all. Sometimes the effect is vocal, as in performing music, and in making and tuning musical instruments, in speaking, &c. In other arts, the touch is the guiding sense, and in some, as in cookery, the taste and smell direct the operator. Each accomplished workman has in his mind many hundreds, not to say thousands, of couples or aggregates of definite movements with other movements and with sensations, contracted in the course of his apprenticeship to his calling.

If we inquire into the circumstances that favor and promote this extensive circle of acquisitions, we shall find several that may be named as of importance. In the first place, *a natural activity of temperament*, or an abundant flow of power to the active members, as shown in a great and various nobility of the frame, is a good basis of bodily acquirements. When the force of the system runs feebly towards the muscular framework, being perhaps expended in other ways, as in the thinking powers, more time is requisite to attain difficult mechanical arts. Another important circumstance is *the acuteness or delicacy of the sense* involved in the operation. A keen eye, sensitive to minute degrees of effect, is wanted in all the various occupations that turn on visible appearances; a good ear is indispensable to music and the arts of producing sounds; and so on. With a naturally dull sensibility to flavor, no man can easily become a good cook, or a taster of tea or wine. The third consideration is *the natural power of adhesive association* belonging to the individual character. Some minds have originally a more powerful adhesiveness than others, either for things generally or for special departments. We see this when a number of boys come together at school, and in apprentices learning together. Some are always found taking the start of the rest in rapidity of acquirement; and although the reason may be found in some of the other circumstances now mentioned, yet observation shows that when everything else is allowed for, there remain natural differences in the rapidity with which the adhesive bond is cemented; some acquiring without effort what others take both time and labor to accomplish. The fourth principal circumstance is the *interest* taken in the work, or the degree to which it engages the feelings of the learner. This is a material consideration, accounting for the acquisitions made in matters that we have a strong taste for without our having a pre-eminence in those other points that constitute natural capacity. These four conditions apply more or less to acquisitions generally.

A detailed exemplification of this great principle of our nature might be given through all the departments of the human intellect. The acquirements of speech, as already said, contain a wide range of instances. The adhesion of language is partly in the vocal organs, partly in the ear, and partly in the eye, when we come to written and printed characters. The associations of names with things, with actions (as in obeying direction and command), and with other names (in acquiring foreign languages), are a gradual growth favored by such conditions as the above. The acquirements in Science, Fine Art, and Business, and in everything that constitutes skill or knowledge, proceed upon this plastic property of the mind. It also enlarges the sphere of our pleasures and pains. There are connections established in the mind between our states of feeling and the things that have often accompanied them, so that the accompaniment shall have power to revive the feeling. It is thus that we contract affections, both benevolent and malevolent, towards persons and things, our friends, our home, our country, our property, our pursuits.

This power of stirring up dependent associations to an extent that may be almost called unlimited (although there are limitations), is peculiar to the animal organization. Nothing parallel to it occurs in the mineral or vegetable world. It is a property of mind alone, and has its seat in the nervous tissue. We know that growth or change is requisite to the progress of the adhesion; for it proceeds most rapidly in youth, health and nutrition, and decays in old age, and during exhaustion and disease. And even to keep our acquisitions from fading away, it is requisite that they should be occasionally revived. A language acquired in early years may be utterly lost by disuse. Sustained practice seems particularly necessary in early education; children's acquisitions are very liable to disintegrate, if not kept up and confirmed by new additions.

Law of Similarity.—This may be expressed as follows:

Present Actions, Sensations, Thoughts, and Emotions tend to revive their LIKE among *previous* impressions.

If the mind worked only by the principle of contiguity, nothing would ever occur to us except in some connection already formed. But some explanation is necessary as to the precise relationship subsisting between the two distinct forces of mental resuscitation, in order to show at once their distinctness and their connection. When the cohesive link between any two contiguous actions, sensations, or ideas, is confirmed by a new occurrence or repetition, it is perfectly obvious that the present impression must revive the sum-total of the past impressions, or reinstate the whole mental condition left on the occasion immediately preceding. Thus, if I am disciplining myself in the act of drawing a round figure with my hand, any present effort must recall the state of the muscular and nervous action, or the precise bent acquired at the end of the previous effort, while that effort had to restore the condition at the end of the one preceding, and so on. But this reinstatement of a former condition by a present act of the same kind, is really and truly a case of the principle before us, or of like recalling like; and without such recall, the progressive adhesion of contiguous things would be impossible. It would appear, therefore, that similarity is tacitly assumed in the operation of contiguity, and is indispensable to the process by which our acquisitions are gradually built up. Why, then, do we set up the associating force of likeness as something independent and distinct? To answer this question, we must advert to the fact, that in those cases where the same impression is deepened by every new repetition, the old and the new are not merely similar, they are *identical*, and the resuscitation takes place without fail, and as a matter of course.

But in going deeper into the explanation of the human intellect, we encounter many classes of similars, where there is not absolute identity, but the mixing of a certain amount of *diversity* with the likeness actually existing. The botanist classing together all the plants of the same order, as, for example, the *Rosaceæ*, has to be struck with the occurrence of certain common characters—viz., the properties that distinguish the order—in the midst of great varieties in all other respects. It is important that he recognize these general marks, whether the plants be trees or shrubs, whether they be poisonous or wholesome, and under many other diversities. It is exceedingly important in science, in the business of life, and even in the creations of fine art, that the mind should take cognizance of likeness surrounded by unlikeness, which is the case that renders it necessary to characterize as distinct the associating force now under discussion. In the case of perfect identity between a present and a past impression, the past is recovered, and fused with the present, instantaneously and surely. So quick and certain is the process that we lose sight of it altogether; we are scarcely made aware of the existence of an associating link of similarity under such circumstances. But when we pass from perfect to imperfect or partial identity, we are more readily led to perceive the existence of this link of attraction between similars, for we find that the restoration sometimes does not take place; cases occur where we fail to be struck with a similitude; the spark of resuscitation does not pass between the new impression and the old dormant one. Then it is that that we recognize differences between the different minds; one man tracing resemblance and making out identity better than another. Moreover, we can assign reasons connected with the culture of the individual, which partially explain superiority or inferiority in this important faculty; just as we have pointed out the conditions favorable to the rapid growth of the adhesive bond of proximity. The failure in reinstating an old impression by virtue of a present one like it, is solely ascribable to the want of perfect identity. When in some new presentation of an object, the old familiar form is muffled, obscured, distorted, disguised, or in any way altered, it is just a chance if we recognize it; the amount of likeness still remaining will have a tendency to revive the object, while the points of difference or unlikeness will operate against the revival, and tend to restore things of their own kindred. If we hear a musical air that we are accustomed to, the new impression revives the old as a matter of course; but if the air is played with complex harmonies and accompaniments which are strange to us, it is possible that the effect of these additions may be to check our recognition of the melody; the unlike circumstances may repel the reinstatement of the old experience more strongly than the remaining likeness attracts it. If our hold of the essential character of melody is but feeble, and if we are stunned and confounded by the new accompaniments, there is every probability that we shall not be put upon the old mental track made by the same air; in other words, we shall not identify the performance.

A few examples may next be given, to show the workings of this associating power, and the consequences thence arising. The intellectual operations known under the names Classification, Generalization, Induction, and Deduction, all proceed upon the discovery of likeness among things lying wide asunder in space and time, and very often veiled by diversity. Thus, in order to include in one list all the species of the *rose*, botanists have had to trace the characters of the genus through its various members, wherever they occur, and under the greatest differences in every other respect. It takes a keen identifying faculty—that is, a strong natural tendency for the resurrection of like to meet like—to see the resemblance of some of these species to the rest; and it has happened in many departments of knowledge that a class has remained incomplete for a time, purely from the disguised character of some of the individuals. So in the process termed *induction*, by which a general law is arrived at by comparing instances of it everywhere, there must be an attraction of similars, in order to bring together in the mind the collection of particulars that the

induction is based upon. Thus, Newton assembled in his view the various transparent bodies that he had found in the course of his experiments to refract or bend light strongly, his only intellectual instrument for doing so being the bond of likeness operating as a power of recall. Having looked at them in company, he saw that some were remarkable for their weight or specific gravity, and others for containing inflammable ingredients; upon which he raised the general induction, connecting these two properties with high refrangibility. Then, *deductively*, he applied this generalization to the diamond, which refracts light more than any other known substance; and as it is not a heavy material, he extended the other inference to it—namely, that it was made up of some inflammable material, an inference afterwards confirmed by the discovery that it is crystallized carbon. Many of the greatest discoveries in science have turned on the identification of modes of action never before supposed the same, as when Franklin was struck with the resemblance between the atmospheric thunder and lightning and the phenomena of common electricity.

Another wide field for the operation of the same principle, is the region of *illustrative comparisons*, whereby two things widely remote are brought together, in the view either to elucidate one another, or for the sake of ornament and poetic effect. Most men of genius in literature and poetry have contributed original illustrations, similes, metaphors, or comparisons in the course of their compositions. Shakspeare carries the palm in this faculty. The writings of Bacon are remarkably rich in those that serve the purpose of exposition. Science is with him the 'interpretation' of nature: final causes are 'vestal virgins;' they have no fruit: fallacies are 'idols.' Edmund Burke, another master of illustrative comparison, has termed revolutions the 'medicine' of the state, and regular government its 'food.'

If we inquire into the circumstances that render one mind more prolific in new identifications and comparisons than another, apart from difference of original capacity, we must refer mainly to the fact, that the one has had the greater previous familiarity with the class of things thus brought up by the attraction of similarity. A mathematician is the most likely person to bring up comparisons from mathematics; a botanist is prepared to identify plants; a traveled man provides illustrations from foreign countries; a historian, from history. The sailor is notoriously rich in nautical similes and illustrations. When any one not specially versed in a subject is yet prone to draw upon it profusely in the way of comparison, we must then refer to great natural endowment as the sole explanation. But our space does not allow us to dwell further on the subject. (For the full exemplification of both the associating principles and of the complications that they give birth to, see Bain on *The Senses and the Intellect.*)

The earliest known attempt to lay down the laws whereby thought succeeds to thought, is that contained in Aristotle's treatise on Memory. He enumerates three different principles of mental resuscitation—viz., Similarity, Contrariety, and Coadjacency. He has been followed by most other philosophers as regards all the three principles. It is now, however, clearly seen and generally admitted, that contrariety is not an independent associating force. When a thing suggests its opposite or contrary, it will be found that the two have been previously together in the mind, and have therefore acquired a mutual hold by contiguity. Such, for example, is black and white, wet and dry, health and sickness, prosperity and adversity, &c. Contraries, in fact, have a natural inseparability; they are of the class of relatives like father and son, which imply each other necessarily, and have no meaning except by mutual reference. It requires no new principle of our constitution to account for suggestion in this particular case. Moreover, when things are strongly contrasted with one another, as high position before a fall, the mind is greatly impressed with the shock of transition, and so retains a lively recollection of the sequence, having by that means a greater tendency to pass from the one to the other. Thus, then, the enumeration of Aristotle is reduced to the two principles that we have now expounded.

Hobbes recognized the principle of contiguity as the foundation of reminiscence; but the Aristotelian philosopher, Vives, who wrote in the 14th c., was the first to specify in minute detail the various circumstances that determine adhesive bond of recollection. Hume's enumeration is well known to have comprised the three principles of resemblance, contiguity, and causation, which he illustrates as follows: 'A picture naturally leads our thoughts to the original, [resemblance]. The mention of one apartment in a building naturally introduces an inquiry or discourse concerning the others, [contiguity]. And if we think of a wound, we can scarce forbear reflecting on the pain which follows it, [causation].' Causation, however, is merely a case of contiguity; so also we may say of Order in Place, and Order in Time, which have been given as distinct principles.

An attempt has been made to generalize Similarity into Contiguity, but without success. For a full and critical view of the history of these laws, see Sir W. Hamilton's edition of Reid.

ASSOUA'N, ESSUA'N, or ESWA'N, the ancient Syene, a town of Upper Egypt, on the east bank of the Nile, near the borders of Nubia, 110 miles south of Thebes, in lat. 24° 5′ 30″ N., and long. 32° 55′ E. There are few remains existing of the ancient city. Some granite columns present themselves among the ruins, but do not seem of an early date; and part of a temple still remains with a dilapidated portico. Of the town-wall, that part which lies to the south of the old town is still standing; and beyond it is the cemetery of A., where there are numerous tombs, mostly cenotaphs, with Arabic inscriptions. In the neighborhood there are several granite quarries, some of them remarkable for remains of ancient materials that had been cut from the rock, and partially hewn, and for antique inscriptions and tablets, announcing the removal of blocks and the reign of the Egyptian monarch by whose orders they had been quarried. The environs of A. are sterile and sandy; but the palm thrives, and the dates, which are excellent, form the staple of the trade. Some traffic is carried on in senna, henna, charcoal, wicker-baskets, and slaves.

The ancient name Syene is the Coptic word *souan* or *suan*, signifying 'opening;' and the modern one is formed by adding the Arabic *el*, 'the,' softened into *es*, viz., *Es-suan*, 'the opening.' A. and its vicinity are highly interesting to geologists and mineralogists; that kind of granite called syenite receives its name from the town.

ASSU'MPTION, a village and river of Lower Canada. About 8 miles below the village, the river flows into the St. Lawrence, or rather into the Ottawa, nearly opposite to the lower extremity of the island of Montreal.—A., or Asuncion, is also the name of the capital of Paraguay, on the left bank of the river of that name. It has a population of 40,000, and has a trade in hides, tobacco, timber, wax, and Paraguay tea. The city was founded in 1535 by the Spanish, and soon became a place of importance, though not of beauty, being ill built, dirty, and disagreeable. The surrounding country is rich in pastures, and also produces crops of wheat, maize, sugar, tobacco, honey, wax, &c.

ASSU'MPTION OF THE VIRGIN MARY. A festival of the Romish Church. In the 7th c., the idea originated that the soul and body of the Virgin had been carried up to heaven by Christ and his angels. The Roman Catholic Church, therefore, has, ever since that period, kept the 15th of August in memory of Mary's translation into glory; although, from the 4th c. until then, it had kept the same day in memory of her death. Liguori, in his *Glory of Mary*, gives a very minute account of the circumstances of her Assumption.

ASSU'RANCE. See INSURANCE.

ASSURANCE, COMMON, is described by Blackstone as the legal evidence of the translation of property, whereby every man's estate is assured to him, and all controversies, doubts, and difficulties are either prevented or removed. For an account of these common assurances or *conveyances*, as they are generally termed, see DEED and CONVEYANCE.

A'SSYNT, a mountainous, moorish, and very rugged district or parish, 25 miles long, and 15 broad, in south-west Sutherlandshire. It mostly consists of a net-work of rocky heights, interspersed with a multitude (200) of dark, motionless tarns or pools, of various sizes, with some larger lochs, the largest, Loch Assynt, being 10 miles long and 1 broad. The district consists of gneiss, Silurian rocks, and primitive limestone. There are a dozen mountains 3000—3500 feet high. Some of the mountains are covered with white bleached stones and protruding rocks like patches of snow. The mountains have frequently the form of artificial pillars and cairns, and are the remains of an enormous denudation of the nearly horizantal strata of the district. Suil Veinn is a perfect sugar-loaf, towering nearly 2000 feet above a rugged table-land of gneiss hills, 800 to 1000 feet above the sea. In Ardvreck Castle, on a promontory on the east side of Loch A., the famous Marquis of Montrose was confined in 1650.

ASSY'RIA (called Athura on Persian cuneiform inscriptions, and Assura on the Median) was the northermost of the three great countries that occupied the Mesopotamian plain. Bounded on the N. by the Niphates Mountains of Armenia; S. by Susiana and Babylonia; E. by Media; and W., according to some, by the Tigris, but more correctly by the water-shed of the Euphrates, for many Assyrian ruins are found to the west of the Tigris. It was about 280 miles long from north to south, and rather more than 150 broad from east to west. This plain is diversified by mountain-chains on the north and east, and watered by the Tigris and its affluents, between two of which—the Zab rivers—lay the finest part of the country, called Adiabené. As it was the boundary-land between the Semitic people and Iran, it became the scene of important political events. Its extraordinary fertility enabled it to support a large population. The high degree of prosperity and civilization reached by its inhabitants in very early times is attested not only by ancient writers, but by the extensive ruins of mighty cities, by the canals and contrivances for irrigation, and by the many proofs—furnished by re-

cent excavations—of an acquaintance with the art and sciences. The ruins of many cities are grouped around Nineveh; while lower down, the Tigris exhibits an almost unbroken line of ruins from Tekrit to Bagdad. Under the Mohammedans, this fine country is now almost a desert.

History.—Ancient authorities differ widely from each other respecting the rise and progress, the extent and the duration, of the Assyrian empire. Ctesias, a Greek of Cnidus, court-physician to Artaxerxes Mnemon, is quoted by various ancient writers; and his information, though utterly incredible and fabulous, has been followed by most classical historians, and by the whole series of ecclesiastical writers. Many ingenious but futile attempts have been made to reconcile his history with the Scripture narrative. Berosus, a priest of Bel at Babylon, who wrote about 268 B.C., and Herodotus, differ widely from Ctesias, but are confirmed in many important particulars by the Bible, and by the continually increasing evidence derived from cuneiform inscriptions.

In the Bible narrative, we are told that Nineveh was founded by Asshur from Babylon (Gen. x. 11). The latter city, therefore, must have been the capital of a more ancient empire, as Berosus asserts, and recent discoveries go far to prove, though Greek writers maintain the reverse. The next notice we have of A. does not occur till 770 B.C., when Pul, king of A., invaded Palestine, but was bought off by Menahem, king of Israel. Tiglath-pileser, who succeeded Pul (738 B.C.), conquered Syria, and carried off many of the Jews into captivity. Next, Salmanezer (730 B.C.) subdued Israel, which, at the instigation of the Egyptians, had refused to pay tribute. The next is Sennacherib (713 B.C.), who attacked Egypt, and threatened Judah under Hezekiah. He was slain by his two sons, and succeeded by his son Esarhaddon, who was also master of Babylon (2 Chron. xxxiii. 11), which, under Nabonassar, had been independent of Nineveh since 747 B.C. Very little credit is to be attached to the expedition of Holofernes recorded in the book of Judith.

After this, the empire appears to have gradually decayed, until at last, in the reign of Sardanapalus II., or Saracus, a league was formed for its destruction between Nabopolassar, governor of Babylon, and Cyaxares, king of Media, which was strengthened by the marriage of Nebuchadnezzar, son of the former, to Nitocris, daughter of the latter. The war and siege are said to have been interrupted by an invasion of the Scythians, which drew off Cyaxares; but at length Nineveh was taken and destroyed about 606 B.C., or, according to Rawlinson, 625. In the time of Darius Hystaspes, A. rebelled without success in conjunction with Media. In the time of Herodotus, the capital had ceased to exist; and when Xenophon passed it, the very name was forgot, though he testifies to the extent of the deserted city, and asserts the height of the ruined walls to be 150 feet. An inconsiderable town seems to have existed on its ruins in the reign of Claudius; and the last notice we have of Nineveh in the classics is in Tacitus.

According to the Greek legends, the Assyrian empire was founded by Ninus. To this monarch and his consort Semiramis are ascribed expeditions on an incredibly magnificent scale against Bactria, Ethiopia, and India. We are told that Semiramis led an army of 3,000,000 infantry, 500,000 cavalry, and 100,000 chariots, and a fleet of 2000 ships, and was encountered by forces more numerous still, and defeated; that she returned to Nineveh, where she soon afterwards died, and was reckoned among the gods, and was succeeded by her son Ninyas, an effeminate prince. The succeeding part of the history as related by Ctesias is equally false, though that writer managed to make the ancient world give credit to his narrative in preference to that of Herodotus. He gives a list of monarchs from Ninus to Sardanapalus, which is now considered to be a clumsy forgery. According to him, for thirty generations after Ninyas, the kings led a life of luxury and indolence in their palace; the last of them, Sardanapalus, made a vigorous defence against Arbaces, the rebel governor of Media, but finding it impossible to defend Nineveh, he set fire to his palace, and burnt himself with all his treasures; this event took place 1306 years after Ninus. Now, the above account represents Nineveh to have perished nearly three centuries before the real date, which was about 605 B.C., and is utterly incompatible with Scripture. Herodotus assigns to the empire a duration of 520 years, and Berosus of 526. In order to reconcile these conflicting accounts, historians have supposed that Nineveh was twice destroyed, but this supposition is now generally rejected. However, that Nineveh was actually destroyed by fire, is proved from the condition of the slabs and statues found in its ruins, which show the action of intense heat.

A. became a Median province, 605 B.C., and afterwards, in conjunction with Babylonia, formed one of the satrapies of the Persian empire. In 331 B.C., at Gaugamela, near Arbela, in A., Alexander defeated Darius Codomannus. In 312 B.C., A. became part of the kingdom of the Seleucidæ, whose capital was Seleucia, on the Tigris. It was afterwards subject to the Parthian kings, whose capital was Ctesiphon, and was more than once temporarily in possession of the Romans. When the Persian monarchy of the Sassanides was destroyed by the successors of Mohammed, A. was subject to the califs. Their seat was Bagdad from 762 A.D. till 1258. It has been under the Turks from 1638, at which period it was wrested from the Persians.

We shall now proceed to mention a few historical points that have been satisfactorily ascertained from the cuneiform inscriptions. For these we are indebted to Rawlinson's *Herodotus*.

It has not been ascertained when A. first became independent of Babylon (q. v.). The seat of government was first at Asshur (now *Kileh-Shergat*), on the right bank of the Tigris, 60 miles south of the later capital, Nineveh. At this place have been found the bricks and fragments of vases bearing the names of the earliest known Assyrian kings, for Ninus and Semiramis are to be considered as mere inventions of Greek writers. The earliest known king is *Bel-lush*, one of a series of four. These reigns probably occupy from 1273 to 1200 B.C. Of the next series of six, the names of five are recorded on the famous Kileh-Shergat cylinder, the earliest purely historical document as yet discovered in Mesopotamia.

Tiglathi-nin, the last of the Kileh-Shergat series, was succeeded by his son, Asshur-dani-pal, the warlike Sardanapalus I. of the Greeks. He made Calah, the modern *Nimrud*, his capital, lying 40 miles further north, on the left bank of the Tigris. His annals are very complete. Among other conquests, he mentions that he had taken tribute from Tyre, Sidon, and other Phœnician cities. He was the founder of the north-west palace at Nimrud, which, next to that of Sennacherib at Koyunjik, is the largest and most magnificent of all the Assyrian edifices. The greater portion of the sculptures now in the British Museum are from this building.

Sardanapalus I. was succeeded by his son Shalmanubar, whose deeds are briefly recorded on the black obelisk now in the British Museum, the full account being apparently reserved for the colossal bulls, which seem to have been the usual dedication after a victory. Of his campaigns, the most interesting to us are those in which he defeated Benhadad of Damascus, and his murderer and successor Hazael. According to his own account, Shalmanubar defeated Hazael, killing 16,000 of his fighting-men, and capturing more than 1100 chariots (884 B.C.). The obelisk also records the tribute paid by *Yahua, son of Khumri*, i. e., Jehu, son of Omri, king of Israel. Now Jehu was son of Jehoshaphat, and had done his utmost to extirpate the family of Omri; but probably Jehu, like other usurpers, was anxious to identify himself with the family which he had dispossessed, and of course the Assyrians accepted the title he gave himself.

Iva-lush, probably the Pul of the Scriptures, is recorded on a pavement-slab from Nimrud to have received tribute from Samaria, Tyre, Damascus, Idumæa, and Palestine, which assertion agrees with the account given (2 Kings xv.) of the 1000 talents paid by Menahem. With this king ends the first dynasty, in which we have 18 monarchs from Bel-lush to Iva-lush (1273—747 B.C.).

The later Assyrian empire begins with Tiglathpileser II. 747 B.C.), and ends with the destruction of Nineveh (625 B.C.). It is plain from Scripture that the empire was in a flourishing condition during the reigns of those kings who came in contact with the Hebrews, and this account exactly accords with the monuments, but contradicts Herodotus. Probably, on the accession of Tiglathpileser II., Babylon had revolted, and this partial rebellion had reached Herodotus in an exaggerated form. The annals of this prince exist only in a very fragmentary state. The name of his successor, Shalmaneser, has not yet been found on the monuments. The capture of Samaria is usually ascribed to this prince, but his successor, Sargon, expressly asserts that Samaria was taken by himself in his first year. Sargon's palace at *Khorsabad*, near Nineveh, furnished the valuable series of monuments now in the Louvre. Sargon was succeeded by his son Sennacherib. He fixed the seat of government at Nineveh, and employed the forced labor of 360,000 men to repair the great palace. Later in his reign, he built a new and more magnificent edifice, which he decorated with sculptures representing his various exploits. This is the palace excavated by Layard. It contained at least three spacious halls—one of them 150 feet by 125, and two long galleries, one of 200, the other of 185 feet, besides innumerable chambers. The excavated portion covers about eight acres. The annals of Sennacherib extend only to his eighth year. He relates at length his successful attack upon Babylon, his invasion of Judæa, the submission of Hezekiah, and his deportation of 200,000 Jews. This expedition is not to be confounded with the second invasion, in which he failed ignominiously, and which is not recorded on his monuments. His assassination very shortly after his return to Nineveh, after his second expedition, readily accounts for this silence.

Esarhaddon, his son and successor, held his court sometimes at Nineveh, sometimes at Babylon. Bricks bearing his name have been discovered at *Hillah*, and a tablet at Babylon dated in his reign. This explains how Manasseh was brought to him at Babylon, when he was led captive from Jerusalem (2 Chron. xxxiii.).

No record has as yet been discovered of this expedition against Palestine. His edifices are not inferior to those of his predecessors. He employed Greek and Phœnician artists, and to them probably we owe the beautiful bas-reliefs that adorn the edifices of his erection. The decline of the empire probably commenced with Asshur-banipal II. The arts of peace flourished, while the military vigor of the nation declined.

The sculptures of this reign are decidedly superior to the earlier in spirit, delicacy, and freedom from conventionality. The slabs show that hunting, not war, was this king's favorite pursuit. He was succeeded by his son Asshur-emit-ili, the last king of whom any records have yet been discovered. It is uncertain whether Nineveh was destroyed under him, or under a successor, the Saracus of Berosus, the effeminate Sardanapalus of the Greeks. The character usually given of this last king, as a debauchee throwing off his indolent habits, and after performing prodigies of valor, perishing by a glorious death, rather than surrender, is derived solely from Ctesias. All we distinctly know is that, finding himself betrayed to the Median king by Nabopolassar, governor of Babylon, he set fire to his palace and perished in the flames.

We may note a singularly important cuneiform discovery made by Mr. George Smith of the British Museum, and the substance of which was made public at a meeting of the Biblical Archæological Society in December 1872. While engaged on an examination of the collection of Assyrian tablets in the British Museum, Mr. Smith lighted upon a curious series of legends, including a copy of the story of the Flood. On discovering these documents, which were much mutilated, he searched over all the collections of fragments of inscriptions, consisting of several thousands of smaller pieces, and ultimately recovered 80 fragments of these legends. The tablets were originally at least 12 in number, forming one story or set of legends, the account of the Flood being on the 11th tablet. Of the inscription describing the Flood, there are fragments of three copies, containing duplicate texts. These texts belong to the time of Asshur-bani-pal (*circa* 660 B.C.), and were found in the library of that monarch in the palace at Nineveh. The original text, according to the statements on the tablets, belonged to the city of Erech, and appears to have been either written in or translated into the Semetic Babylonian at a very early period. Mr. Smith is of opinion that its composition cannot be placed later than the 17th c. B.C., while it may be much older. The Assyrian story of the Deluge is both like and unlike the Scripture narrative. The Flood is sent as a punishment for sin; the builder of the ark is called Sisit (the *Xisuthrus* of the Græco-Chaldæan Berosus); he gathers into the vessel all his male and female servants, all the sons of the army, and all the beasts of the field; the storm of rain lasts only six days, and yet submerges the whole earth; all life is destroyed; Sisit sends forth a dove which can find no resting-place, and returns; then a swallow, which is also forced to return; then a raven, which does not come back. The ark rests on a mountain, the animals are liberated, an altar is built by the grateful patriarch, and Bel, the Great God, makes a 'covenant' with Sisit.

The minuter details of this Assyrian legend diverge greatly from the Hebrew account, and lead to the conclusion that in each we have an independent tradition of some great natural catastrophe in the early ages of human history. Mr. Smith notices that the Biblical narrative is the version of an inland people; the name of the ark in Genesis means a chest or box, and not a ship; there is no notice of the sea or of launching, no pilots are spoken of, no navigation is mentioned. The inscription, on the other hand, belongs to a maritime people; the ark is called a ship, the ship is launched into the sea, trial is made of it, and it is given in charge to a pilot. This seems to point to the Persian Gulf as the birthplace of the old legend. Mr. Smith returned in 1874 from Chaldæa, and gave an account of his valuable discoveries in a work entitled *Assyrian Discoveries* (1875). Believing that many more legends and histories lay beneath the ruins of the ancient cities of Chaldæa, he was on his way to prosecute his third exploration, when he succumbed to the hardships and privations of the task, and died at Aleppo in August 1876.

Government.—The government was despotic, as suited the character of the people. The empire was a mere congeries of kingdoms bound to the supreme authority only by certain obligations of paying tribute, giving presents, and showing due respect. Each kingdom retained its own rulers, laws, and religion, although we do find some attempts to rule by satraps and collectors of tribute. Tigtath-pileser also boasts, in an inscription, of having punished and crucified the Chaldæans who refused to worship his gods. In consequence of this imperfect organization, the empire was exposed to frequent revolts of the subject nations, when such opportunities offered as a disputed succession, or want of energy in the ruling prince. Then the labor of conquest had to begin anew, and it was sought to diminish the danger of the central power by inflicting severe punishments on the rebels. The history of the Jews has made us familiar with one of these devices —viz., the wholesale deportation of the inhabitants of the offending district. It may be readily believed that such an empire, though imposing from the magnificence and wealth of the capital, yet, from the impoverishment and weakness of the subject states, was continually liable to fall to pieces, and was ill fitted to resist an attack from without. That A. did actually last for five centuries, was owing to a long succession of warlike princes, and to the energy of the population.

Religion.—The religion of the Assyrians was nearly identical with that of the Babylonians. It was a gross polytheism, their gods being thousands in number, and each village having its own particular deity. From thousands of theological tablets now in the British Museum, it is known that each divinity had many names, and some of them as many as fifty titles besides. Again, many deities that are prominent in the Babylonian pantheon are either unknown or occupy a subordinate position in the Assyrian. Besides, the same gods did not remain equally popular throughout. The supreme god was Asshur, probably the deified patriarch. His worship was confined to Assyria. He is generally associated in the inscriptions with *Nin* and *Nergal* (2 Kings xvii. 30), who are represented by the man-bull and the man-lion. The winged globe, so often seen in the sculptures, from which a figure with a horned helmet shoots his arrows, is supposed to be the emblem of Asshur. Next in rank is the governing triad, answering to the Pluto, Jupiter, and Neptune of the classical mythology; the next group corresponds to Æther, the sun and the moon; then five inferior deities, representing the five planets. Each god is associated with a goddess. Mylitta, or Beltis, is the 'queen.' The male and female powers of the sun are represented in the Scripture phrase, 'Adrammelech, and Anamelech, gods of Sepharvaim'—that is, of Sippara, a town a few miles above Babylon. *Bel-merodach* was originally an inferior deity, son of Héa, the fish-god; but under the later Babylonians, we find him monopolizing the greater part of the homage which used previously to be divided among several. Nisroch (2 Kings xix. 37) has not been yet ascertained. Nebo (Isaiah xlvi.) is one of the five planetary gods, and corresponds to Mercury. The systems of notation, divisions of time, the planets and stars, animals and metals, divination and astrology, were all more or less closely connected with theology.

Ethnology.—The Assyrians have been assigned by some ethnologists to the Aryan race, but it is now generally acknowledged that they were a branch of the Semitic family of nations, and therefore were members of the same grand division of the human race as the Syrians, the Phœnicians with their colonies, the Jews, and the modern Arabians. In the 20th c. B.C., Semitism, as a distinct ethnic element, appears to have first developed itself. The original races, variously called Scythic, Turanian, or Tatar, appear to have once been spread over the whole space from the Caucasus to the Indian Ocean, and from the Mediterranean to the mouths of the Ganges. Their type of language has continued to our time to exist in four-fifths of Asia, and in some of the remoter corners of Europe, as among the Finns, Lapps, Turks, and Hungarians. In Mesopotamia, and in the valley of the Nile, where natural advantages induced men early to form settled communities, the rude and inartificial type of language was developed into Hamitism, and afterwards still further improved into Semitism. Then seems to have commenced a series of migrations. Asshur went forth probably at this time from Babylon to A., Abraham and his followers to Palestine, the Joktanian Arabs to Arabia. From these seats, Semitism was afterwards carried to Cyprus, to the southern seaboard countries of Asia Minor, to Carthage, Sicily, Spain, and Western Africa.

The traditions of A. indicate a very early connection between Ethiopia, Arabia, and the cities on the Euphrates. Mesopotamia undoubtedly contained a large proportion of Arabians, and this accounts for the fact that Herodotus styles Sennacherib king of the Arabians and Assyrians. The Chaldæans, colonies of whom were planted in Armenia by the Assyrian kings, are supposed by some to have been a foreign tribe, which had immigrated from the north, and become a priestly caste. But the *Akkad* race, of which the Chaldæan is a tribe, is with more probability thought to have inhabited Babylonia from the remotest times, and by it the earliest civilization in Mesopotamia was originated. Probably the art of picture-writing was possessed by the Hamitic tribes who lived in the valley of the Nile, and passed eastward to the Euphrates. The *Akkad* language appears to have been formed before Semitism attained its peculiar development and organization. Long after Semitism had become predominant in Mesopotamia, the *Akkad* or Chaldæan alphabet continued to be the scientific language in which all the tablets relating to mythology, astronomy, or science, as well as most historical and official records, were written. This alphabet was adopted with certain modifications by the Semitic tribes, which became predominant in Assyria. The cuneiform characters were elaborated from the forms of natural objects, and gradually became phonetic from being symbolic, and for convenience of engraving, assumed the form of arrow-heads, instead of the rounded and flowing forms which are introduced by the use of the plastic materials. After the Aryan race had spread more ex-

tensively in Western Asia, the Persian monarchs, when they wished to make any communication to their subjects generally intelligible, found it necessary to publish it in three languages, belonging to the principle divisions of human speech; hence the trilingual inscriptions of Behistun, &c., which consist of an Indo-European, a Tatar, and a Semitic column. It is still necessary in many places to employ three tongues, representatives of the three families, Persian, Turkish, and Arabic.—See Lenormant, *La Langue Primitive de la Chaldée.*

Antiquities, Civilization, &c.—The excavations carried on by M. Botta, French consul at Mosul, and by Layard near Mosul, Khorsabad, and Koyunjik, have led, as we have partly seen, to very interesting discoveries. The palaces and buildings that have been laid open are full of sculptures, all covered with inscriptions, in deciphering which considerable progress has been made, and more may be expected. Among the most remarkable monuments now in the British Museum are two winged, human-headed lions, 12 feet high, and as many in length; winged human-headed bulls of similar dimensions with the lions; winged sphinxes; and the famous obelisk of black marble, sculptured on the four sides. On

Lion-hunt.
[From the North-west Palace at Nimrud.]

this last are represented a victory, a prisoner prostrate at the feet of the king, and foreign people offering tribute, and leading such animals as the Bactrian camel, elephant, lion, and rhinoceros—animals found only in lands far east of the Tigris. The bas-reliefs are very numerous, exhibiting especially war and hunting. The march, the onset, the pursuit, the siege, the passage of rivers, the submission and treatment of captives, secretaries noting the number of heads taken in battle, and the amount of spoil; the chase of the lion, of the antelope, of the wild ass, and other animals—such are the favorite subjects of the Assyrian sculptor. Nor are they treated in the conventional style of Egypt, but in the manner which, for grace, spirit, correctness and delicacy of execution, excels everything else known in Asiatic art. The artists sometimes follow modes of representation different from ours; for instance, a bull has five legs given him, in order that from all points of view he may be seen with four; a ladder stands edgeways against a wall, to show it is not a pole. But a truthful impression is always aimed at, and it is this that gives these sculptures their value. The labor bestowed on the careful finish of a priest's dress, and in the tasteful decoration of an article of furniture, proves them to be the work of an ingenious and painstaking people. From the bas-reliefs we gain but little information respecting the private life of the Assyrians. There are a few which represent the foddering of cattle, women riding on mules, &c.

It is natural to expect that Nineveh—a wealthy and luxurious city—imported many of the products of other countries, yet the manufactured goods would mainly be of home production. The jars, bronzes, glass bottles, carved ornaments in ivory and mother-of-pearl, engraved gems, bells, earrings, arms, utensils, are of excellent workmanship. The ornaments especially are in good taste, and evince no inconsiderable skill in the working of metals. Transparent glass was not unknown, nor the use of the lens as a magnifying agent. The Assyrians knew the principle of the arch, the use of the lever and roller, and the construction of aqueducts and drains. In the arts of peace, they appear to have been not inferior to any ancient nation; while their conquests, and the long duration of their empire, suffice to prove their capacity for war.—See Rawlinson's *Five Great Monarchies of the Ancient World, Chaldæa, Assyria, Babylonia, Media, and Persia*; George Smith's *Assyrian Discoveries* (1875), his *Assyria* (S.P.C.K.), and his *Babylonia* (new ed. by Sayce); and the article *Babylonia*, in the *Ency. Brit.*, 9th ed.

A'STACUS. See Crayfish and Lobsters.

ASTA'RTÉ (styled Ashtaroth in the Old Testament), the name of the chief female deity of the Phœnicians, Carthaginians, and Syrians (Syria Dea), also worshiped by the Jews in times when idolatry prevailed. A. was the original from which the Greeks borrowed their Aphrodite (q. v.). As Baal was god of the sun, A. was goddess of the moon. Her chief temples were in Tyre and Sidon. According to ancient accounts, her worship was of a licentious character. The oldest known image of her—that in Paphos—represented her simply under the form of a white conical stone. In Canaan and Phœnicia she was subsequently typified under the form of a cow, or sometimes she had only a cow's or bull's head; still later, her emblem became a star; and finally she was conceived of as the 'queen of heaven,' sitting on a lion, her head surrounded with rays, and in the one hand a thunderbolt, in the other a sceptre.

ASTA'RTÉ, a genus of Mollusca, with bivalve shells, the type of a family *Astartidæ*, very closely allied to the *Veneridæ* or Venus family. It is interesting chiefly with reference to geologic changes and the history of life and organization, because only a few species seem now to exist, and these limited to the North Atlantic and Aertic Oceans, whereas the fossil species are extremely numerous, commencing with the *lias* period, and distributed over the whole world. The Astartidæ may be regarded as having given place to the Veneridæ, which commenced with the oolitic period, and are among the most abundant bivalve mollusca of the present time.

A-STAY', the position of an anchor when, during heaving, the cable forms an angle with the surface of the water in line with the stays of the ship.

A'STER (Gr. a star, from the form of the flowers), a genus of plants of the natural order *Compositæ*, which Lindley has therefore chosen to call *Asteraceæ*. The ray and the disk are of different colors. The genus contains a great number of species, both herbaceous and shrubby, which have been arranged into six or seven groups, regarded by many as distinct genera. One species only, *A. Tripolium* or *Tripolium vulgare*, the Sea Starwort, is a native of Britain. It is common in salt marshes. A number of perennial species are in cultivation as garden-flowers, of which the New-England A. (*A. Novæ Angliæ*) and the Michaelmas Daisy (*A. Tradescanti*), both natives of North America, are perhaps the most common, and, with some of the other species, are prized as among the comparatively few flowers to be seen at that dull season when autumn is giving place to winter. But the best known and most valued of all the asters is the China A. (*A. Chinensis*), a summer annual, of which many varieties are in cultivation, and new ones are continually introduced. It was brought from China in the earlier part of the 18th c. The varieties exhibit great diversities of form and color. The plant delights in a rich free soil. In the northern parts of Britain, the seed is generally sown in April in a hot-bed, or in pots under a frame, and the young asters are planted out in the open air in May. They flower from July to the end of autumn, and contribute much to the liveliness of the flower-garden. —*A. argophyllus*, or *Haxtonia argophylla*, is a shrub, a native of Van Diemen's Land, smelling strongly of musk. The whole plant has a whitish aspect. It grows to a considerable size, but succeeds in the open air only in the very south of England.

ASTERABA'D. See Astrabad.

ASTE'RIAS and ASTERI'ADÆ. See Star-fish.

A'STERISK (Gr. a little star), a sign or symbol (*), used in writing or printing either as a reference to a note at the bottom or on the margin of the page. The obelisk (q. v.), or dagger (†), and many other marks are similarly employed; but when there are several references on the same page, it is now common to use the numerals 1, 2, 3, &c. The A. and other similar signs may have any arbitrary meaning assigned to them at the will of the writer, an explanation being previously given what the signification is to be. The Greek grammarians, or critics, used the A. to mark a passage that had been unjustly suspected, but was to be held as genuine, or a passage in any way remarkable; the obelisk, again, marked an interpolated or an objectionable word or passage.

ASTEROI'DS. See Planetoids.

ASTEROPHY'LLITES (Gr. *aster*, a star, and *phyllon*, a leaf), a generic name, under which are included many of the most abundant fossil plants of the coal-measures. The leaves are arranged in a stellated manner around the stems or branches. The A. are ranked among the exogenous or dicotyledonous fossils, but they are of doubtful affinity, and the exact determination of their place in the system has not yet been accomplished.

A'STHMA is a disease characterized by the breathing, previously natural, becoming difficult, and accompanied by wheezing and a distressing sense of tightness in the chest. A. generally appears at first after some inflammatory affection of the respiratory mucous membrane, and more especially in those who have led dissipated lives. In others, it is clearly hereditary, and frequently affects several members of the same family. A. may be habitual, or may occur in spasms, generally preceded by some premonitory symptoms, as in some by great drowsiness; others, says Dr. Hyde Salter, 'know by extreme wakefulness and unusual mental activity and buoyancy of spirits; and I knew one case in which an attack of ophthalmia occurred.'

The spasms may occur at any hour; but in nineteen out of twenty cases they waken the patient from sleep between three and four in the morning. The horizontal position facilitating the

flow of blood to the right side of the heart, and therefore to the lungs, the disadvantage at which the muscles of respiration are placed, and the greater readiness with which sources of irritation act during sleep, explain this fact.

Persons subject to A. scarcely dare fall asleep after any imprudence of diet; if they continue awake till their supper is fairly digested, and the stomach empty, they may go to sleep fearlessly, and have a good night's rest. The asthmatic paroxysm is thus described by Dr. Salter, the latest authority on this common but terrible disease: 'The patient goes to bed and sleeps two or three hours, becomes distressed in his breathing, and begins to wheeze, so as to waken those in adjoining rooms. He awakes, changing his position, falls asleep again and again, and the miserable fight between A. and sleep may go on, till the increased suffering does not allow the patient longer to forget himself for a moment; he becomes wide awake, sits up in bed, throws himself forward, plants his elbows on his knees, and with fixed head and elevated shoulders, labors for breath like a dying man.'

If the spasm is protracted, the oxygenation of his blood is imperfectly performed, owing to the scanty supply of air, and his extremities get cold and blue, but at the same time the violent muscular efforts at respiration cover him with sweat. The pulse is always small. The muscles of the back and neck attached to the ribs, act as extraordinary muscles of respiration. The chest enlarges during the paroxysm, but in it there is almost perfect stagnation of air. The respiratory tubes affected are very small, and the parts at which they are so constricted are constantly shifting.

The remedies for A. are numerous, but not to be depended on. They consist in paying attention to the digestive system, and in anti-spasmodics, either taken internally or by inhalation.

A'STI (*Asta Pompeia*), a city of Piedmont, in the government of Alessandria, lies on the left bank of the Tanaro, on the railway from Turin to Genoa, 26½ miles E.S.E. of Turin. Pop. (1881) 17,340. It is a large town, with walls considerably dilapidated, and the streets generally very narrow and irregular. It is the seat of a bishop, and has a court of justice and a royal college. There is carried on a considerable trade in silk and woollen fabrics, leather, and hats, as well as in wines and agricultural produce. A. is a town of high antiquity, having been famous for its pottery before its capture by the Gauls in 400 B.C. On the occasion of its being again taken and destroyed in an irruption of the Gauls, it was rebuilt by Pompey, and received the name of Asta Pompeia. In the middle ages, A. was one of the most powerful republics of Upper Italy. It was captured and burnt by the Emperor Frederick I. in 1155; and after a series of vicissitudes, it came into the possession of the Visconti of Naples, by whom it was ceded to the French, in whose hands it remained till the middle of the 16th c., when it came into the possession of the Dukes of Savoy, as it still remains. Alfieri was born here, 1749.—The district of Asti, one of the six subdivisions of the government of Alessandria, is bounded on the W. and N. by the province of Turin, S. by Alba, S.E. by Alessandria Proper, and N.E. by the province of Casale. The surface is hilly and picturesque. The soil rests upon limestone abounding in fossils, and is fertile, producing corn, fruit, and wine. It is celebrated for a fine white wine resembling champagne, called *vino d'Asti*. Silk is one of its most important products.

ASTON, LUISE, a German authoress of some note, but principally known for her zeal in behalf of the 'rights of women.' She was born about 1820, in the vicinity of Halberstadt, and at an early age was married to a wealthy English manufacturer. Their union was not happy; perhaps her peculiar views of society and of the proper position of her sex contributed to the estrangement of their sympathies. After separating from her husband, she attracted public attention, especially in Berlin, by appearing on the streets in man's dress, smoking cigars, &c. This conduct brought her into several collisions with the police, and she was twice forced to leave the city. During the Slesvig-Holstein war, however, she found a nobler sphere for her woman's nature, and displayed the greatest heroism and self-sacrificing devotion as an hospital nurse. She has written various books, the principal are—*Wild Roses* (1846), and *Frieschärler-Reminiscenzen* (1849), each of which contains 12 lyrical poems, none very able; *Meine Emancipation, Verweisung, und Rechtfertigung* (1846); a novel, *Aus dem Leben einer Frau* (1847); *Revolution und Contre-revolution* (1849). In 1851, she married Dr. Meier of Bremen.

ASTOR, JOHN JACOB, an enterprising merchant, founder of the 'American Fur Company,' was born in a village near Heidelberg, in Germany, 1763. After spending some years in London, he sailed to America in 1783, and soon invested his small capital in furs. By economy and industry, he so increased his means that after six years he had acquired a fortune of 200,000 dollars. Although the increasing influence of the English Fur Companies in North America was unfavorable to his plans, he now ventured to fit out two expeditions to the Oregon territory—one by land, and one by sea—the purpose of which was to open up a regular commercial intercourse with the natives. After many mishaps, his object was achieved in 1811, and the fur-trading station of Astoria (q. v.) was established; but the war of 1812 stopped its prosperity for a time. From this period A.'s commercial connections extended over the entire globe, and his ships were found in every sea. He died in 1848, leaving property amounting to 30,000,000 dollars. He left a legacy of 350,000 dollars for the establishment of a public library in New York. (Washington Irving's *Astoria*.)—His wealth was mainly inherited by his son, WILLIAM, who continued to augment it till his death in 1875, when he is said to have left £10,000,000. He added £40,000 to his father's bequest for a public library. He was known as the 'landlord of New York' from the extent of his property in that city. See *Chambers's Journal*, No. 632, fourth series.

ASTO'RGA, EMANUELE D', a musician, celebrated partly on account of his personal history, was born in Sicily in 1680. His father, a baron of Sicily, in the contest respecting the annexation of the island to Spain, was delivered over to the enemy by his own mercenary soldiers, and was executed in 1701; while his wife and son (Emanuele) were barbarously compelled to witness the tragedy. The wife died on the spot, and the son fell into a state of unconsciousness. Afterwards, through the interest of the Spanish Princess Ursini, he was educated in a monastery at Astorga in Leon, from which he derived his name. Here he especially devoted himself to music, and made such progress that he was invited to the court of the Duke of Parma. His patron, erroneously suspecting that his daughter was receiving his addresses, sent him away to the court of the Emperor Leopold. After Leopold's death, A. traveled through Europe, and is supposed to have died in a Bohemian monastery. His best work is the *Stabat Mater*, a masterly composition, of which the original score is preserved in Oxford.

ASTO'RIA, originally a fur-trading station on the left bank of the Columbia, near the Pacific, named from its founder, John Jacob Astor. It demands notice here chiefly as having been a main point in the American claim to the Oregon Territory (q. v.).

ASTRABA'D, a town in the north of Persia, capital of the province of the same name, is built at the foot of the northern slope of the Elbruz Mountains, on a small river which runs into A. Bay, at the south-east extremity of the Caspian, from which it is distant 20 miles. Lat. 36° 50′ N., long. 54° 31′ E. It was long the residence of the Kajar princes, from whom the present Shah of Persia is descended; but on account of its situation in a remote corner of the kingdom, it was not advanced to the dignity of the metropolis of Persian Teheran, at the foot of the chain of mountains which separates Iran from Mazanderan, became the capital; and since then the importance of A. has considerably sunk. It is still enclosed by a dry ditch and mud-wall, 3 miles in circumference, but its great towers have disappeared. Trade has increased since the establishment of a Russian consulate. The causeway constructed by Shah Abbas is kept in good repair, and connects A. with Khorassan, Afghanistan, &c. Pop. 6000 to 8000. The town is a very unhealthy residence during the summer rains.

ASTRÆ'A, daughter of Zeus and Themis, or of Astræus and Aurora, was the goddess of justice, the last of all the goddesses who left the earth when the golden age had passed away and men began to forge weapons and perpetrate acts of violence. She took her place in heaven as the constellation Virgo in the zodiac.—Greek art usually represented her with a pair of balances in her hand, and a crown of stars on her head.—A. is also the name of one of the Planetoids (q. v.).

ASTRÆ'A. See CORAL and MADREPORE.

ASTRA'GALUS, a bone of the foot, which by a convex upper surface and smooth sides, forms, with leg-bones, the hinge of the ankle-joint. Its lower surface is concave, and rests on the *os calcis*, or heel-bone, to which it is attached by a strong ligament. In front, it has a round head, which rests in the concavity of the scaphoid, another bone of the tarsus, and upon an elastic ligament, its pressure upon which gives in a great measure the necessary elasticity to the foot: it is at this joint that inversion and eversion of the foot take place. It will be seen that the A. is a bone of great importance to the member, as it supports the weight of the body in standing, and enters into most of the movements of the foot. It is occasionally displaced, generally in front of the outer ankle.

ASTRA'GALUS, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*. The pod is more or less perfectly 2-celled. The leaves are pinnate, with a terminal leaflet. The species are numerous, natives chiefly of the temperate and colder parts of the Old World, shrubby, and often spiny, or unarmed and herbaceous. A number of the shrubby species yield the substance called Tragacanth (q. v.), or Gum Tragacanth.—*A. Bœticus*, an

annual, native of the south of Europe, with upright branching stems, is cultivated in Hungary, Germany, and other parts of Europe, for its seeds, which are roasted, ground, and used as a substitute for coffee, or mixed with it to improve its flavor.—The Sweet Milk-vetch, or Wild Liquorice (*A. glycyphyllos*), a native of Britain and other parts of Europe, perennial, with long and very thick roots, which penetrate deep into the soil, and almost prostrate stems, three feet in length, is occasionally cultivated for food of cattle, yielding a very abundant herbage. Cattle are not fond of it at first, but are said to become fond of it after being accustomed to it for some time. The roots have somewhat of the sweetness of liquorice.

Astragalus Boëticus.

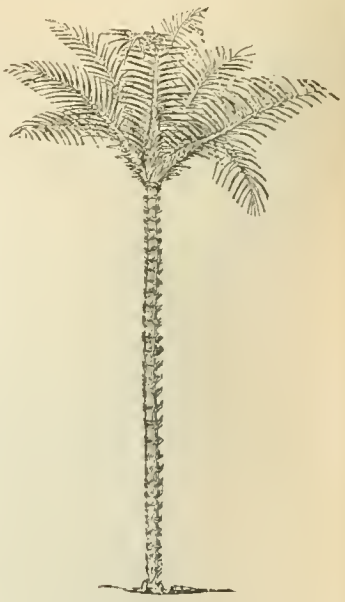
ASTRAKHA'N, originally a province of the Mogul empire, but united with the Russian empire in 1554. At present, A. forms one of the south-east governments of Russia in Europe, and is bounded on the S. by the Caspian Sea and the Caucasus; on the W., by the country of the Don Cossacks; on the N., by the government of Saratov; and on the E., by Orenburg. Area, 50,000 sq. m.; pop. (1880) 688,750. The province of A. is almost entirely a barren waste, the only fertile portions being the banks of the Volga, which divides the province into two equal parts. Salt is procured from the marshes of the steppes; considerable numbers of cattle are reared, and the annual value of the sturgeon-fishing in the Volga is as much as 2,500,000 rubles (about £400,000). The climate varies from 70° F. in summer, to 13° in winter. The population is composed of diverse elements—Russian, Tatar, Georgian, Armenian, Bokharese, Persian, and Hindu.

ASTRAKHA'N, the chief town of the government of the same name, is situated on an island of the Volga, and near the Caspian Sea, in lat. 46° 21′ N., and long. 48° 4′ E. It is the seat of a Greek archbishop and an Armenian bishop; has thirty-seven Greek, two Roman Catholic, one Protestant, and two Armenian churches; fifteen mosques, an Indian temple, a gymnasium, a seminary for priests, a botanical garden, and many manufactories. Pop. (1880) 57,700. The houses are mostly of wood, and irregularly built. The fisheries in the Volga supply occupation to great numbers of the inhabitants of A. and its neighborhood. The principal exports are leather, linen and woollen goods, salted sturgeon, caviar and isinglass. Imports consist chiefly of gold-embroidered silken goods from Persia, silk stuffs, woollen goods, rice, rhubarb, raw silk, drugs, &c. From July to October, the neighborhood of A. is frequently visited by swarms of locusts.—A. is the name of a fine description of fur, the produce of a variety of sheep found in Bokhara, Persia, and Syria.

A'STRAL SPI'RITS. The star (Gr. *astron*) and fire worship of the eastern religions rested on the doctrine, that every heavenly body is animated by a pervading spirit, forming, as it were, its soul; and this doctrine passed into the religio-physical theories of the Greeks and Jews, and even into the Christian world. In the demonology or spirit-systems of Christendom in the middle ages, A. S. are conceived of sometimes as fallen angels, sometimes as souls of departed men, sometimes as spirits originating in fire, and hovering between heaven, earth, and hell, without belonging to any one of these provinces. Their intercourse with men and their influence were variously represented, according to the notion formed of their nature. As the belief in spirits and witchcraft reached its height, in the 15th c., the demonologists, or special students of this subject, systematized the strange fancies of that wild period; and A. S. were made to occupy the first rank among evil or demoniacal spirits. Paracelsus, however, and others attributed to every human being an astral spirit, or sidereal element, in which the human soul, or spirit proper, is thought to inhere, and which lives for a time after the person dies.

ASTRI'NGENTS, medicines employed for the purpose of contracting the animal fibres and canals, so as to check fluxes, hæmorrhage, and diarrhœa. The drugs most commonly used as A. are alum, catechu, oak-galls, rhatany-root, &c. Many of the vegetable A. owe that property, in whole or in great part, to tannin. A severe degree of cold is a powerful astringent.

ASTROCA'RYUM (from the Gr. *astron*, a star, and *karyon*, a nut), a genus of Palms, of which about sixteen species are known, natives of tropical America, remarkable for the abundance of acute and formidable spines—in some cases, a foot long—with which almost every part—stem, leaves, spathe, and fruit-stalk—is armed. They have beautiful pinnated leaves; some of them are lofty, others are of very moderate height, as 8—15 feet, whilst some are almost or altogether stemless. The fruit of some species is eatable—a juicy pulp covering a stony seed—as the fruit of the MURUMURU palm (*A. Murumuru*), the pulp of which is said to resemble a melon in flavor, has a sort of musky odor, and is highly esteemed. It is a palm of only about 8—12 feet high, abundant about Pará and elsewhere on the Amazon. Cattle roam the forests in quest of its fruit, and swine fatten on the seed, which they crush with their teeth, although to break it requires a smart blow of a hammer, and in hardness it almost resembles vegetable ivory. Another edible fruit is that of the TUCUMA palm (*A. Tucuma*), abundant in the same regions. These fruits are about an inch long, the Murumurú ovate, the Tucumá almost globular. The Tucumá palm is 30—40 feet high, the stem encircled with narrow rings of black spines, which are disposed with beautiful regularity. The TUCUM palm (*A. vulgare*), a species quite distinct from the Tucumá, and more lofty, is of great importance to the Indians, and in places where it is not indigenous, is cultivated with care for the sake of the epidermis of its unopened leaves, of which they make cordage, very useful for bow-strings, fishing nets, &c. The fibre is at once fine, strong, and durable, and may yet perhaps become important as an article of commerce. Beautiful hammocks are made of tucum thread, which are sold at about £3 each, or if ornamented with feather-work borders, at twice that sum. Martius, in his great work on Palms, has, by mistake, represented the Tucumá instead of the Tucum palm as yielding this fibre. See Wallace, *Palm Trees of the Amazon*. Lond. 1853. The fibre is obtained by cutting down the terminal bud or column of unopened leaves which rises from the center of the crown of foliage. The tender leaflets are then carefully stripped of their epidermis, in pale, ribbon-like pellicles which shrivel up almost to a thread. These are tied in bundles, and dried, and are afterwards twisted into thread, or made into thicker cords, by mere rolling and manipulation.



Tucúm Palm (*A. vulgare.*)

Stemless Palm (*A. acaule*).
b, spadix, with spathe forming a hood over fruit; *c*, fruit, about one-fifth natural size.

A'STROLABE (from two Greek words signifying 'to take the stars'), the name given by the Greeks to any circular instrument for observing the stars. Circular rings, arranged as in the Armillary sphere (q. v.), were used for this purpose. A projection of the sphere upon a plane, with a graduated rim and sights for taking altitudes, was known as an A. in the palmy days of astrology, and was the badge of the astrologer. The A. has been superseded by the more perfect instruments of modern astronomy.

ASTRO'LOGY meant originally much the same as *astronomy*, 'the knowledge of the stars,' but was at length restricted to the science of predicting future events, especially the fortunes of men, from the positions of the heavenly bodies. This was considered the higher, the real science; while the mere knowledge of the stars themselves, their places and motions (astronomy), was, till a very

recent period, cultivated mostly with a view to (judicial) astrology. A. is one of the most ancient forms of superstition, and is found prevailing among the nations of the East (Egyptians, Chaldæans, Hindus, Chinese) at the very dawn of history. The Jews became much addicted to it after the captivity. It spread into the West and to Rome about the beginning of the Christian era. Astrologers played an important part at Rome, where they were called Chaldæans and Mathematicians; and though often banished by the senate and emperors under pain of death, and otherwise persecuted, they continued to hold their ground. The Roman poet, Manilius, author of an astronomical poem still extant, was addicted to A.; and even Ptolemy the astronomer did not escape the infection, which in his time had become universal. It accords well with the predestinarian doctrines of Mohammedanism, and was accordingly cultivated with great ardor by the Arabs from the 7th to the 13th c. Some of the early Christian fathers argued against the doctrines of A., others received them in a modified form. In its public capacity, the Catholic Church several times condemned the system; but many zealous Catholics, even churchmen, have cultivated it. Cardinal d'Ailly, 'the Eagle of the doctors of France' (died 1420), is said to have calculated the horoscope of Jesus Christ, and maintained that the deluge might have been predicted by A. For centuries the most learned men continued devoted to this delusive science; Regiomontanus, the famous mathematician Cardan, even Tycho Brahé and Kepler could not shake off the fascination. Kepler saw the weakness of A. as a science, but could not bring himself to deny a certain connection between the positions ('constellations') of the planets and the qualities of those born under them. The Copernican system gave the death-blow to A. When the earth itself was found to be only one of the planets, it seemed absurd that all the others should be occupied in influencing it. The argument has really little force, but it produced the effect. Belief in A. is not now ostensibly professed in any Christian country, though a few solitary advocates have from time to time appeared, as J. M. Pfaff in Germany, *Astrologie* (Bamb. 1816). But it still holds sway in the East, and among Mohammedans wherever situated. Even in Europe the craving of the ignorant of all countries for divination is still gratified by the publication of multitudes of almanacs containing astrological predictions, though the writers no longer believe in them.

Many passages of our old writers are unintelligible without some knowledge of astrological terms, numbers of which have taken root in the language. In the technical rules by which human destiny was foreseen, the heavenly *houses* played an important part. Astrologers were by no means at one as to the way of laying out those houses. A very general way was to draw great circles through the north and south points of the horizon, as meridians pass through the poles, dividing the heavens, visible and invisible, into twelve equal parts—six above the horizon, and six below. These were the twelve houses, and were numbered onward, beginning with that which lay in the east immediately below the horizon.

The first was called the house of life; the second, of fortune, or riches; the third, of brethren; the fourth, of relations; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death, or the upper portal; the ninth, of religion; the tenth, of dignities; the eleventh, of friends and benefactors; the twelfth, of enemies, or of captivity. The position of the twelve houses for a given time and place—the instant of an individual's birth, for instance—was a *theme*. To construct such a plan was to *cast* the person's nativity. The houses had different powers, the strongest being the first; as it contained the part of the heavens about to rise, it was called the *ascendant*, and the point of the ecliptic cut by its upper boundary was the *horoscope*. Each house had one of the heavenly bodies as its *lord*, who was strongest in his own house.

ASTRO'NOMY (Gr. *astron*, a star, *nomos*, a law) teaches whatever is known of the heavenly bodies. A. may be properly divided under three heads. 1. *Geometrical or Mathematical A.*, including the exact determination of the numerical and geometrical elements of the heavenly bodies—that is, their distances, shapes, magnitudes, the figures they describe in their motions, &c. 2. *Physical A.*, or the nature of the powers or forces that carry on the heavenly motions, the laws that they observe, and the calculation of the motions from a knowledge of these laws. 3. *Sidereal A.*, or whatever is ascertained regarding the universe of the fixed stars. *Practical A.* might form another division, which would include a knowledge of the various astronomical instruments; and a familiarity generally with the rules and calculations by which the requisite results are deduced from observations.

Such parts of this extensive subject as are deemed suited to the present work, will be found under their appropriate heads, such as ABERRATION OF LIGHT, AEROLITES, CIRCLE, COMET, ECLIPSES, EQUATOR, LIBRATION, METEORS, MOON, NEBULÆ, PARALLAX, PLANETOIDS, PLANETS, PRECESSION, REFRACTION, SOLAR SYSTEM, STARS, SUN, TRANSIT INSTRUMENT, &c.

A brief sketch of the history of astronomical discovery is all that can be attempted in the present article.

The history of A. dates from a very early period. It is the most ancient of all the sciences. The Chinese, Hindus, Chaldæans, Egyptians, and even the Greeks, are known to have investigated the heavens very long before the Christian era. But with the first four nations, A. may be said to have been a sentiment rather than a science—a vague notion built up out of crude speculations, rather than a correct theory founded on systematic observation. In China, A. was intimately associated with state politics; the Indians, Chaldæans, and Egyptians made it a matter of religion; and each of these nations applied it to astrological purposes. In Greece alone was it prosecuted for its own sake.

The Chinese, Chaldæans, Hindus, and Egyptians each claim the honor of having been the first students of A., and each has had advocates to support its claim. The Tirvalore tables (asserted by the Hindus to belong to an epoch of 3102 years B.C.—the commencement of the Cali-yug, or iron age, of their mythology—at which period a conjunction of the sun, moon, and planets is said to have occurred) are, so far as their date is concerned, altogether unreliable. Modern calculations have conclusively proved that no such conjunction could possibly have taken place at the time specified; and the elements of the tables are, in the general opinion of scientific men, of a character far in advance of the actual observations of that period. There is no doubt that the epoch is fictitious—that the date of these tables is fixed much earlier than their internal evidence justifies; but it is matter of dispute whether they were the result of the observations of Hindus themselves at some later period before the Christian era, or whether they were constructed after that era from data furnished to them by the Arabs or Greeks. Those who hold the former view, quote the well-known mathematical attainments of the Indians, and their aversion to intercourse with foreigners, as arguments in its favor; those who support the latter, point out that the tables are a mean between those of Ptolemy and Albategnius, or Al Batani, a distinguished Arabian astronomer, and therefore likely to have been derived from these two sources. Those who are interested in the question of the originality of these tables, may refer to Delambre, and to Bailly's *Hist. de l'Astronomie Indienne*.

The Chinese have astronomical annals claiming to go back 2857 years B.C. In these there is little record of anything but of the appearance of comets and solar eclipses; and regarding the latter phenomena, they tell nothing, save the fact and date of their occurrence. Professional astronomers were compelled to predict every eclipse under pain of death.

The popular idea was, that an eclipse was a monster having evil designs on the sun, and it was customary to make a great noise, by shouting, beating of gongs, &c., in order to frighten it away from its solar prey. The many eclipses which the Chinese report have been recalculated, but not more than one anterior to the time of Ptolemy could be verified. At an early period, however, the Chinese appear to have been acquainted with the luni-solar cycle of nineteen years (introduced into Greece by Meton, and since known as the Metonic Cycle), and they had also divided the year into 365¼ days. Solstitial observances are said to have been made by a gnomon in the 11th c. B.C. To the burning of all scientific books by one of their princes (Tsin-Chi-Hong-Ti), 221 B.C., the Chinese attribute the loss of many theories, or methods previously in use. The precession of the equinoxes was not known to the Chinese until 400 A.D., but long prior to that they were familiar with the motion of the planets.

The mass of evidence seems in favor of the plains of Chaldæa being the primal seat of observative A. The risings and settings of the heavenly bodies and eclipses were subjects of observation and notation by their priests at a very remote period. Simplicius and Porphyry mention that Aristotle had transmitted to him from Babylon, by order of Alexander the Great, a catalogue of eclipses observed during 1903 years preceding the conquest of that city by the Macedonians. Ptolemy gives six of the eclipses from this catalogue, but the earliest does not extend further back than 720 B.C. The probability therefore is, that the statement of Simplicius, as to their early date, is an exaggeration. In these observations, the time is only given in hours, and the part of the diameter eclipsed within a quarter; but rough as they are, they are the earliest reliable observations extant; and a comparison of them with modern observations, led Halley to the discovery of the doctrine of the moon's acceleration—that is, that she now moves round the earth with greater velocity than formerly. It is remarkably illustrative of their habit of diligent observation, that the Chaldæans were acquainted with the cycle of 6585⅓ days, during which the moon makes about 223 synodical revolutions, and experiences the same number of eclipses, alike, too, in order and magnitude, comparing cycle with cycle. The clepsydra as a clock, the gnomon for determining the solstices, and a hemispherical dial for ascertaining the positions of the sun, were used by the Chaldæans, and they have the credit of the invention of the zodiac and the duodecimal division of the day.

The Egyptians, it is supposed, were the first instructors of the Greeks in A. They do not, however, appear to have observed much for themselves. The meaning of what data they have left behind them can be guessed at only in a few instances. No mention is made by Ptolemy of the idea ascribed to them, that the planets Mercury and Venus moved round the sun; the probability therefore is, Ptolemy not being likely to overlook such a novel theory, that they entertained no such notion at the time of his visit, but that is an after-thought of more recent ages. From the accuracy with which some of the pyramids face the cardinal points, there is a supposition that they must have been erected for astronomical purposes; but if it be true, as is stated, that Thales taught the Egyptians how to find the height of the pyramids by the shadow, and that the latter informed Herodotus that the sun had twice been seen to rise in the west, the conclusion is that the A. of the ancient Egyptians was very meagre and absurd.

Up to this time, A. is little else than tradition. The Greeks have the honor of elevating it into a reliable history, and to the dignity of a science. Thales (640 B.C.), the founder of the Ionic school, laid the foundation of Greek A. He it was who first propagated the theory of the earth's sphericity. The sphere he divided into five zones. He predicted the year of a great solar eclipse, but this it is now supposed he must have casually succeeded in doing—the Greeks at this time having no observations of their own to guide them—by means of the Chaldæan Saros, or period of eighteen years and ten days, which gives a regular recurrence of eclipses. He made the Greeks, who, prior to his time, were content to navigate their vessels by the Great Bear—a rough approximation to the north—acquainted with the lesser constellation of that name, a much better guide for the mariner. His system, however, contained a good deal of absurdity. Among other things, he held that the stars were composed of fire, and that the earth was the center of the universe. The successors of Thales held opinions which in many respects are wonderfully in accordance with modern ideas. Anaximander, it is said, held that the earth moved about its own axis, and that the moon's light was reflected from the sun. To him is also attributed, on somewhat slender authority, the belief in the grand idea of the plurality of worlds. Anaxagoras, who transferred the Ionic school from Miletus to Athens, is said to have offered a conjecture that, like the earth, the moon had habitations, hills, and valleys.

Pythagoras (500 B.C.), who was the next astronomer of eminence, was very far in advance of his predecessors. He promulgated, on grounds fanciful enough, the theory, the truth of which, however, has been since established, that the sun is the center of the planetary world, and that the earth circulates round it. Pythagoras also first taught that the morning and evening star were in reality one and the same planet. But the views of Pythagoras met with little or no support from his successors until the time of Copernicus. Between Pythagoras and the advent of the Alexandrian school, nearly a couple of centuries later, the most prominent names in astronomical annals are those of Meton (432 B.C.), who introduced the luni-solar cycle, as already intimated, and in conjunction with Euctemon, observed a solstice at Athens in the year 424 B.C.; Callippus (330 B.C.), who improved the Metonic cycle; Eudoxus of Cnidus (370 B.C.), who brought into Greece the year of 365¼ days, and wrote some works on A.; and Nicetas of Syracuse, who is reported to have taught the diurnal motion of the earth on its axis.

To the Alexandrian school, owing its existence to the munificent Ptolemies, we are indebted for the first systematic observations in A. Hitherto the truths of A. rested on no better evidence than the conjectures of sagacious minds, and these being opposed to the testimony of the senses, met with but little acceptance from the world. The Alexandrian school originated a connected series of observations relative to the constitution of the universe. The positions of the fixed stars were determined, the paths of the planets carefully traced, and the solar and lunar inequalities more accurately ascertained. Angular distances were calculated with instruments suitable to the purpose by trigonometrical methods, and ultimately the school of Alexandria presented to the world the first system of theoretical astronomy that had ever comprehended an entire plan of the celestial motions. The system we know to be false, and inferior to the Pythagorean notions; but it had the merit of being founded upon a long and patient observation of phenomena, a principle, which finally brought about its own destruction, while the previous theories were the results of pure hypothesis.

The most interesting circumstances connected with the early history of the Alexandrian school are the attempts made to determine the distance of the earth from the sun, and the magnitude of the terrestrial globe. Aristarchus of Samos—the pioneer of the Copernican system, as Humboldt calls him—is the author of an ingenious plan to ascertain the former. See ARISTARCHUS OF SAMOS.

Among other eminent members of this school were Timocharis and Aristyllus, who made the observations, which, together with observations of his own, enabled Hipparchus (q. v.) to discover the precession of the equinoxes; Eratosthenes (q. v.) who was the first who attempted to determine on true principles the magnitude of the earth, and to clear, as Humboldt expresses it, 'the description of the earth from its fabulous traditions;' and Autolycus, whose books on A. are the earliest extant in the Greek language.

We have now arrived at by far the greatest name we have yet met in astronomical science—that of Hipparchus of Bithynia (160—125 B. C.), and here may be said to begin the real written history of scientific A.; for not until his era were there facts correct enough and sufficient in number upon which to build a system. Hipparchus was at once a theorist, a mathematician, and an observer. He catalogued no less than 1081 stars. This is the first reliable catalogue we have. He discovered, as we have already mentioned, the precession of the equinoxes; he determined with greater exactitude than his predecessors had done, the mean motion, as well as the inequality of the motion of the sun; and also the length of the year. He also determined the mean motion of the moon, her eccentricity, the equation of her center, and the inclination of her orbit; and he suspected the inequality afterwards discovered by Ptolemy (the evection). He invented processes analogous to plane and spherical trigonometry, and was the first to use right ascensions and declinations, which he afterwards abandoned in favor of latitudes and longitudes.

For more than two centuries and a half after the demise of this indefatigable astronomer, we meet with no name of note. Ptolemy (130—150 A. D.) is the next who rises above the mass of mediocrities. Besides being a practical astronomer, he was accomplished as a musician, geographer, and mathematician. His most important discovery in A. was the libration or evection of the moon. He also was the first to point out the effect of refraction. He extended and improved many of the theories of Hipparchus, and was the founder of the false system known by his name, and which was universally accepted as the true theory of the universe, until the researches of Copernicus exploded it. The Ptolemaic system, expounded in the *Great Collection*, or, as it was called by the Arabs, the *Almagest*—from which source most of our knowledge of Greek A. is derived—placed the earth immovable in the center of the universe, making the entire heavens revolve round it in the course of twenty-four hours.

With Ptolemy closes the originality of the Greek school. His successors were men of no mark, confining themselves for the most part to astrology, or to comments on earlier writers. It is to the Arabs that we owe the next advances in A. They commenced making observations 762 A.D., in the reign of the Caliph Al Mansur, who gave great encouragement to science, as did also his successors, the 'good Haroun Alraschid' and Al Mamoum, both of whom were themselves diligent students of A. For four centuries, the Arabs prosecuted the study of the science with assiduity, but they are chiefly meritorious as observers. They had little capacity for speculation, and throughout held the Greek theories in superstitious reverence. They, however, determined with much more accuracy than the Greeks had done the precession of the equinoxes, the obliquity of the ecliptic, and the solar eccentricity; and the length of the tropical year was ascertained within a few seconds of the truth. The most illustrious of the Arabian school were Albategnius or Al Batani (880 A.D.), who discovered the motion of the solar apogee (see ANOMALISTIC YEAR), and who was also the first to make use of sines and versed sines instead of chords; he corrected the Greek observations, and was altogether the most distinguished observer between Hipparchus and the Copernican era; and Ibn-Yunis (1000 A. D.), an excellent mathematician, who made observations of great importance in determining the disturbances and eccentricities of Jupiter and Saturn, and who was the first to use cotangents and secants.

In the northern part of Persia, an observatory was erected by a descendent of the renowned warrior Genghis Khan, where some tables were constructed by Nasir-Eddin; and at Samarcand, Ulugh Beg, a grandson of Timur, made, in 1433 A.D., many observations, and the most correct catalogue of stars which, up to his time, had been published.

In the 13th c., A. was again introduced into Western Europe, the first translation from the *Almagest* being made under the Emperor Frederick II. of Germany, about 1230; and in 1252 an impulse was given to the science by the formation of astronomical tables under the auspices of Alfonzo X. of Castile. An Englishman, named Holywood (Sacrobosco), in 1220 wrote a book of great repute in its day on the spheres, chiefly abridged from Ptolemy; and among others who did much to promote a taste for A. were Purbach (1460), Regiomontanus (John Muller), who died in 1476, and Waltherus, a pupil of the latter, who made numerous observations of merit.

We now come to the illustrious name of Copernicus (b. 1473, d. 1543), to whom was reserved the grand honor and the danger -for there is ever danger in bringing old notions into disrepute by introducing new systems of truth—of exploding the Ptolemaic idea, and of promulgating a correct though inperfect theory of the universe. His system is in some part a revival and systematic appli-

cation of the opinions said to have been held by Pythagoras. It makes the sun the immovable center of the universe, around which all the planets revolve in concentric orbits, Mercury and Venus within the earth's orbit, and all the other planets without it. In the Copernican theory, there were many of the old notions which have since been exploded. It is a current belief that Copernicus, afraid to state boldly such heterodox views of the universe, as those he entertained, gave them forth in the form of an hypothesis. Humboldt, in his second volume of *Cosmos* (p. 345), denies that he did so. This distinguished authority says: 'The language of Copernicus is powerful and free, and bursts forth from his inmost convictions, and thus sufficiently refutes the ancient opinion, that he has brought forward the system which is immortalized by his name, as an hypothesis made for the convenience of calculating astronomers, or for one which has but a probable foundation.' The same author also refutes the popular notion that Copernicus died a few hours after receiving a printed copy of his book. He was broken down in body and mind when his work *On the Revolutions of the Heavenly Bodies* was brought to him, but he did not die until 'many days afterwards, on the 24th May 1543.'

Among the contemporaries of Copernicus were Rheinhold, who constructed the Prutenic tables; Recorde, who was the first to write on A. in English; and Nonius, a Portuguese, who invented a method for dividing the circle. The study of A. was also much aided about this time by the liberality of the Landgrave of Hesse-Cassel, William IV.

Decidedly the most industrious observer and eminent practical astronomer from the time of the Arabs to the latter half of the 16th c. was Tycho Brahé (b. 1546, d. 1601). Considerable odium attaches to him on account of his repudiation of the Copernican system, but it should not be forgotten that in the time of Tycho that system was not supported by the conclusive evidence we are now in possession of. Tycho's system, which made the sun move round the earth, and all the other planets round the sun, they moving with it round the earth, explained all natural phenomena then observed equally well, while it must have appeared more probable than the crude and, at that era, undemonstrable theories of Copernicus. Tycho Brahé compiled a catalogue of 777 fixed stars, more perfect than any that had previously appeared. He made the first table of refractions, and discovered the variation and annual equation of the moon, the inequalities of the motion of the nodes, and the inclination of the lunar orbit, and rejected the trepidation of the precession, which had hitherto injuriously affected all tables. He also made some interesting cometary investigations.

To his researches are mainly due the discovery by Kepler (b. 1571, d. 1631) of those famous laws which have rendered his name immortal. See KEPLER. To Kepler is due the credit of divesting the Copernican system of its absurdities. Kepler is also said to have had some notion of the law of gravitation.

Galileo Galilei (b. 1564, d. 1642) first applied the telescope (which he made from a general description of the instrument of Hans Lipperhey of Holland, who was the first inventor of the telescope) to the investigation of the heavens. He was rewarded by the discovery of the inequalities on the moon's surface. The important discoveries of the four satellites of Jupiter, the ring of Saturn—not then distinctly recognized as a circle—the spots on the sun, and the crescent form of Venus, followed in quick succession. For propagating the Copernican doctrine of the world, Galileo incurred the displeasure of the priests, and was compelled by the Inquisition to retract his opinions.

But the eternal laws of nature are not to be suspended by the recantation of a philosopher forced by the tyranny of priestcraft. The earth moved grandly on round the sun in spite of both; and scientific truth was now too old to remain in the restrictive leading-strings of any ecclesiasticism.

The next great epoch in the history of A. brings us to England and Newton (b. 1642, d. 1727). In the interval, practical A. had profited largely by the logarithms of Napier; the mathematical researches of Descartes; the application of the telescope to the quadrant by Gascoigne, an Englishman, and afterwards by Auzout and Picard; by Römer's discovery of the progressive motion, and measurement of the velocity, of light; by the invention of Venier; and the application of the pendulum to clocks by Huygens, who also brought into use the spiral spring, and made some valuable observations on the ring and satellites of Saturn; as well as by the investigations of Norwood, Horrocks, Hooke, Hevelius, Gilbert, Leibnitz and Dominicus Cassini, to the last of whom especially the scientific world owes much. Among a variety of other valuable observations and discoveries may be mentioned his thorough investigation of the zodiacal light, his determination of the rotations of Jupiter and Mars, and of the motions of Jupiter's satellites from their eclipses, his discovery of the dual character of Saturn's ring, and also of four of his satellites. Newton's fame rests upon his discovery of the law of gravitation, upon which the common belief is he was led to speculate by the fall of an apple. Newton announced his discovery in the *Principia* in 1687, which was briefly that every particle of matter is attracted by, or gravitates to, every other particle of matter, with a force inversely proportional to the squares of their distances. The first gleam of this grand conclusion is said to have so overpowered Newton that he had to suspend his calculations, and call in a friend to finish the few arithmetical computations that were incomplete. The discovery is perhaps the grandest effort of human genius of which we have any record. Newton also made the important discovery of the revolution of comets round the sun in conic sections, proved the earth's form to be an oblate spheroid, gave a theory of the moon and tides, invented fluxions, and wrote upon Optics.

While the foundations of physical A. were thus broadly laid by Newton, Flamsteed—the first astronomer royal at Greenwich, to whom, until recently, scant justice has been done—and Halley were greatly improving and extending the practical department of the science. To the former we are indebted for numerous observations on the fixed stars, on planets, satellites, and comets, and for a catalogue of 2884 stars. His *Historia Cœlestis* formed a a new era in sidereal A. Dr. Halley, who succeeded Flamsteed as astronomer royal, discovered the accelerated mean motion of the moon, and certain inequalities in Jupiter and Saturn, but he is most famed for his successful investigations into the motions and nature of comets. His successor was Dr. Bradley, who, in the year of Newton's death, made the important discovery of the aberration of light, which furnishes the only direct and conclusive proof we have of the earth's annual motion. To him also we are indebted for our knowledge of the nutation of the earth's axis. He was, besides, an unwearied observer, and left behind him at his death upwards of 60,000 observations. Altogether, Bradley's is deservedly one of the most honored names in modern A. Dr. Maskelyne, who was appointed to the observatory after Bradley, originated the *Nautical Almanac*.

Merely to mention the names of men who from the death of Bradley to the present time have added, by theory or practice, to our knowledge of A., would extend this synopsis much beyond the limit necessarily assigned to it. If the 18th c. opened with lustre derived from the physical demonstrations of Newton, it closed magnificently with the telescopic discoveries of Sir William Herschel, who added to our universe a primary planet (Uranus) with its satellites, gave two more satellites to Saturn, resolved the milky-way into countless myriads of stars, and unraveled the mystery of nebulæ and of double and triple stars. Laland, Lagrange, Lacaille, and Delambre, in the latter half of the 18th c., did much by their researches and analysis to systematize and improve the science of A. The instrumental means of observation were also, during that time, brought to high perfection. Laplace, in his great work the *Mécanique Céleste* (1799—1808), gave what further proof was needed of the truth and sufficiency of the Newtonian theory.

The 19th c. opened with the discovery of the four small planets —Ceres, in 1801, by Piazza; Pallas and Vesta by Olbers—the former in 1802, and the latter in 1807; and Juno, by Harding, in 1804. In 1845, Hencke discovered the fifth of this group revolving between Mars and Jupiter, to which the name of Astræa was given; and by the end of 1881, 220 Planetoids (q. v.) had been discovered. The greatest event of the century has been the discovery of the planet Neptune in 1846.

Observations upon Uranus had shown the motions of that planet to present great irregularities, which could not be explained by the action of Jupiter and Saturn; and after carefully examining the analytical theory of Uranus, Leverrier, a young academician of France, in the summer of 1846, published the elements of an undiscovered planet, the cause of the perturbations. He boldly predicted its existence, calculated its mass, and referred to its place in the heavens; and scarcely a month afterwards, on the 23d of September, the hitherto concealed object (Neptune) was found by M. Galle of Berlin. But it has only been by accidental circumstances that France has the honor of this remarkable achievement. Mr. Adams of Cambridge had arrived at results more perfect than those of Leverrier, and had communicated them to Mr. Challis, professor of A. at Cambridge in September 1845, a year before the discovery of the planet, and nearly a year before the publication of Leverrier's final calculations. Mr. Challis, it appears, commenced a search for the planet on July 29th, and on August 4th and 12th, he actually seized the planet, and recorded two positions of it, but did not recognize it, through not comparing his observations, which a pressure of occupation, and an impression that the discovery required a much more extensive search, prevented. But for this, and the non-publication of the Cambridge mathematician's results at the time they were forwarded to Sir George Airy in October 1845, the honorable position of M. Leverrier would have been occupied by Mr. Adams, and that of M. Galle by Mr. Challis.

The century, however, has been chiefly remarkable for its laborious efforts to correct, systematize, and extend the results of former discoveries. Admirable and extensive catalogues of stars and double stars, and of nebulæ, have been made; and optical and other instruments have been brought to what appears almost a

state of perfection, Lord Rosse's reflecting telescope, with a speculum six feet in diameter, being the triumph of modern mechanical and mathematical skill. In more recent years, research has been directed chiefly towards the physical nature of the sun and other heavenly bodies by means of spectrum-analysis. See SPECTRUM; SUN.

A'STUR. See FALCONIDÆ and GOSHAWK.

ASTU'RIAS, a northern province of Spain, bounded on the E. by Santander, on the S. by Leon, on the W. by Galicia, and on the N. by the Bay of Biscay. The low hills of Leon and Old Castile rise gradually to the mountain-chain which forms the south boundary, and towers to a height of about 11,000 feet in the summit *Peña-de-Peñaranda*. The main road from Leon to Oviedo passes over the mountain-chain at Pajares. The northern slopes are broken by steep and dark valleys or chasms, which are among the wildest and most picturesque in Spain. The summits of the mountains are covered with snow even as late in the year as August. The climate is damp; clouds hang almost continually about the peaks, gathering to them the fogs of the Atlantic. From the mass of calcareous rock, marble crags rise from 200 to more than 400 feet. The principal kinds of wood are oak, chestnut, silver and Scotch firs. Some of the forests in the remoter districts are very superb. Alpine pasturage decks the slopes, and a richer covering of green is found in the narrow valleys. In the wider valleys, the soil yields barley, wheat, maize, figs, olives, grapes, oranges. The coasts have good fisheries. The chief minerals of the province are copper, iron, lead, cobalt, arsenic, antimony, and coal. The pasturage of the higher valleys supports an excellent breed of horses, with numerous horned cattle.

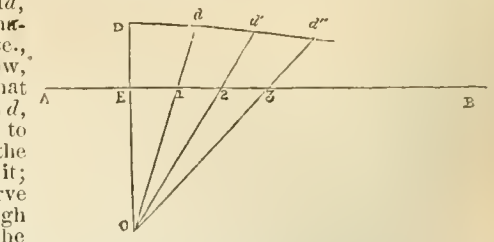
A. was never firmly occupied by the Arabs, but afforded a place of refuge to the Goths in the 8th c. Here the famous Pelayo was made king in 718 A.D.; and his successors, after contending successfully against the Arabs, were made kings of Leon in the 10th c. The Asturian still boasts of his independence as a free hidalgo, and is simple in manners and brave, but less industrious and sociable than his neighbors in Biscay and Galicia. Many Asturians leave their province to seek a livelihood in other parts of Spain, and after saving money, return to dwell among their native hills and valleys. They have been termed the Swiss of Spain; and they are equally faithful and fond of money. Among them, the *Vaqueros* form a distinct caste, intermarrying among themselves, and leading a nomadic course of life, spending the winter on the sea-coast, and the summer on the hills of Leytariegos. OVIEDO, the capital of A., has, since 1833, given its name to the whole province. Area of A., 3686 square miles; pop. (1877) 576,352.

The eldest son of the Spanish king has the title of Prince of A., professedly an imitation of the English Prince of Wales, having been taken at the solicitation of the Duke of Lancaster in 1388, when his daughter married the eldest son of Juan I.

ASUNCION, capital of Paraguay. See ASSUMPTION.

ASY'LUM, a place of refuge. In ancient times, sacred places, especially the temples and altars of the gods, were appointed as asylums to which criminals, as well as persecuted individuals, might flee for refuge; and to molest them in such places was regarded as an impiety. An analogous institution is found in the laws of the Jews as described in the 35th chapter of Numbers, where six 'cities of refuge' are appointed for persons guilty of manslaughter. Among the Greeks in early times, these asylums might be sometimes useful in preventing hasty retribution; but in the course of time they were so much abused that their sanctity was in a great measure disregarded. Thus Pausanias, who fled to the altar of Minerva, was taken and slain there by the Lacedæmonians, and in other cases the refugee was compelled to leave the A. by fire or starvation. In Rome, the Emperor Tiberius abolished all such places of refuge from law, excepting those in the temples of Juno and Æsculapius. The custom of allowing to real or supposed criminals a place of safety in temples, was also adopted by the Christian Church. In the time of Constantine the Great, the churches were made asylums; and Theodosius II. extended the privilege to all courts, alleys, gardens, and houses belonging to the church. In 681 A.D., the synod of Toledo extended the privilege of A. to a space of 30 paces around every church. In the lawless periods of the middle ages, the influence of the church often prevented deeds of gross injustice and violence; but the sanctity of churches was abused by criminals; and this led to several modifications which gradually destroyed the privilege of Sanctuary (q. v.). In England, it was abolished by acts passed in 1534 and 1697. The word A. is now applied to places of shelter for unfortunate or destitute persons, and especially to hospitals for the insane. See LUNACY.

A'SYMPTOTE (Gr. not coinciding), a line that approaches nearer and nearer to some curve without ever meeting it. An example of an A. will be seen under HYPERBOLA. As another illustration, let AB be a straight line which can be produced to any length towards B. Take any point, C, without the line, and draw a perpendicular reaching to any distance, D, beyond the line; set off any equal distances, E—1, 1—2, 2—3, &c., along AB; and draw C1*d*, C2*d'*, C3*d''*, &c., making 1*d*, 2*d'*, 3*d''*, &c., equal to ED. Now, it is evident that each of the points *d*, *d'*, &c., is nearer to the line AB than the one to the left of it; if, therefore, a curve is traced through these points (the curve is called the *conchoid*), it must continually approach the line AB. On the other hand, it is evident that the curve can never meet AB; for a line drawn from C to any point in AB, however distant that point, must, when produced, cross AB. AB is thus an *A.* to the curve. To the senses, indeed, the curve and line soon become one, because all physical or sensible lines have breadth. It is only with regard to *mathematical* lines (see LINE) that the proposition is true; and the truth of it has to be conceived by an effort of pure reason, for it cannot be represented.



Asymptote.

ATA'CAMITE, an ore of copper, found as a crust on the lavas of Vesuvius and Etna, especially on those of Vesuvius, erupted in the years 97, 1804, 1820, and 1822. It occurs abundantly in some parts of South America, as at Atacama in Peru, from which it derives its name; at Remolinos, Santa Rosa, and other districts in Chili; and at Sarapaca in Bolivia, where it is associated in veins with ores of silver. The natural varieties of A. are crystallized, massive, and pulverulent or granular. The massive or compact variety is usually reniform, with a fibrous structure. The crystals are short and needle-shaped; the primary form is a rhombic prism. It has been sometimes described as a chloride of copper, but incorrectly; and sometimes as a hydrochlorate (muriate) of copper; it is rather to be regarded as a combination of protoxide of copper with chloride of copper. It is a rich and productive ore, containing about 55 to 60 per cent. of copper. The percentage composition of various specimens of A. is as follows:

	Copper Protoxide.	Muriatic Acid.	Water.	Total.
Compact atacamite, . .	72·0	16·3	11·7	100
" " . . .	76·5	11·0	12·5	100
Sandy atacamite, . . .	70·5	11·5	18·0	100
Crystallized atacamite, .	73·0	16·2	10·8	100

A. often forms on the surface of copper exposed to the air or sea-water; and the greenish incrustation observed on antique bronze utensils, weapons, and other articles, and commonly known as the *ærugo nobilis*, is composed of this salt. On some antique bronzes from Egypt the A. is crystalline. Atacamite is worked in South America as an ore of copper; and considerable quantities are sent to England to have the metal extracted therefrom. See COPPER.

ATAHUALPA, the favorite son of Huayna Capac, Inca of Peru, who died in 1525, about seven years before Pizarro's arrival in Peru. The mother of A. not being of the pure Inca blood, her son was formally excluded from inheriting the throne; but his handsome figure, bold spirit, and quick intelligence so won upon the affections of his father, that on his death-bed he declared it to be his will that A. should receive as his portion the ancient kingdom of Quito (recently conquered), while Huascar, his eldest son, should possess Peru. For five years the brothers lived on terms of real or apparent friendship; but at length the restless ambition of A., who was constantly aspiring to new conquests, excited the uneasiness of Huascar, who, in an evil hour, was induced to send an envoy to his brother, with instructions to require him to render homage for his kingdom of Quito. A. fired at the proposal, and war was instantly declared. Placing himself at the head of the army of veterans which his father had left him, he invaded Peru, and in the spring of 1532 completely defeated Huascar on the plains of Quipaypan, in the neighborhood of Cuzco, the native Peruvian metropolis, only a few months before the arrival of the Spaniards. Huascar was taken prisoner, and confined in the strong fortress of Xauxa. Then followed, according to Garcilasso de la Vega, a series of atrocious massacres of all in whose veins ran the blood of the Incas; but his statements are so monstrous, and possess so little congruity, that they are rejected by Prescott as intrinsically incredible. In the meantime, the Spaniards had disembarked at Tumbez; and after a long, brave, and perilous march through the unknown country, Pizarro, at the head of his two hundred cavaliers, approached the victorious camp of A., where he found some fifty thousand men assembled. By a daring but diabolical stratagem, Pizarro obtained possession of the person

of the king, who had come to visit him in a friendly spirit. While a priest was explaining the Christian religion, and the power of the pope over all the kingdoms of the earth, and how the pope had presented Peru to the Spanish monarch, in whose name they had come, A., indignantly interrupting him, told him that the pope (whoever he was) must be a crazy fool to talk of giving away countries which were not his own. When he inquired on what authority such claims were made, the priest pointed to the Bible, on which A. dashed the book on the ground, and the fields began to fill with Indians. The moment was critical. The crime which Pizarro had resolved upon the night before must be executed then or never.

He waved a white scarf, which was the signal agreed upon. The mysterious artillery poured sudden death into the terrified masses of Peruvians, while the Spanish cavalry rode them down with merciless fury. Confusion seized the natives; they submitted—being unarmed—to this horrible butchery, only anxious to save their sacred Inca; but all their efforts to accomplish this proved unvailing, and after exhausting hours in the miserable work of murder, the inhuman Spaniards succeeded in capturing him. A. was treated with a great show of kindness at first, and more especially when he offered, as a ransom, 'not merely to cover the floor, but to fill the room in which he stood with gold as high as he could reach.' When A.'s brother, Huascar, who was still a prisoner, heard of this, he offered still more advantageous terms for himself. To prevent this, A. had him secretly assassinated. The golden treasure which was to constitute the ransom of A. now began to pour in, and at length A. demanded his freedom. This Pizarro refused to grant, and accused A. of plotting against him. The result, after much base treachery on the part of the Spaniard, was a mock-trial, in which A. was condemned to be burned. On the 29th of August 1533, he was led to the stake, but on agreeing to be 'baptized,' his sentence was commuted to death by strangulation.

ATALA'NTA, a mythical personage, the daugther of Jasus and Clymene, was born in Arcadia, and celebrated as a huntress, well skilled in the use of the bow and arrow. Her father, who had wished a son, exposed her, while an infant, on Mount Parthenios, where she was found near the entrance of a cave by hunters, who are said to have brought her up, and afterwards restored her to her parents. While living as a wild mountain-maiden, she slew the centaurs Rhœcus and Hylæus. Afterwards, she sailed with the Argonauts (q. v.) to Colchis, and took a prominent part in the chase of the Calydonian boar (q. v.). She had many suitors, but was merciless in the conditions which she imposed on them. Being the swiftest of mortals, she offered to become the wife of him that should outstrip her—the penalty of defeat being death. At length she was conquered by a trick of one Meilanion, whom she was compelled to marry. He obtained from Venus a gift of three golden apples, which he successively dropped in the race; and A. was so charmed by their beauty, that she could not refrain from stooping to gather them, and so lost.—Mention is made of another A. in Greek antiquity, to whom a different parentage is assigned, but regarding whom the myth is essentially the same.

ATARAIPU', a term signifying *Devil's Rock*. It is applied to one of the most singular eminences in the world, a granite pyramid in British Guiana, which rises abruptly from the plain about 900 feet, wooded for rather more than one-third of the height, but bare thence to the peaked summit.

ATCHAFALAY'A, a branch of the Mississippi at its delta. It forms so large an angle with the main river, that, after a course of only 130 miles, it enters the Gulf of Mexico, 120 miles west of New Orleans. From the Red River, which enters the Mississippi just above its own point of departure, the A. had received so much drift-wood, as formed at last a stationary raft 10 miles long, 220 yards broad, and 18 feet deep—an obstacle to navigation which the state of Louisiana required four years to remove.

ATCHEE'N, a kingdom forming the north-west part of Sumatra; area, 2260 sq. m.; pop. 500,000; in 95° 20'—97° 40' E. long., and 2° 50'—5° 40' N. lat. The interior is mountainous—Abong Abong, 11,000 feet; Loose, 11,000; the Golden Mountain, 6460; Batu Gapit, 6155; Tampat Tuan, 4020. The natives are well made, industrious, intelligent, treacherous. In 1873, the Dutch declared war, and though at first repulsed, may now be said to have conquered the country. A., the capital, lies on both sides of the river in 5° 35' N. lat., and 95° 26' E. long., in a large valley formed by ranges of hills, of which the Golden Mountain is the highest. Pop. 36,000. They barter for opium with Penang and Singapore, pepper, edible nests, gold-dust, camphor, benzoin, sulphur, satin-wood, betel-nuts, &c.

ATCHE'VEMENT is a term nearly equivalent to armorial bearings, and is often used of a funeral escutcheon. See HATCHMENT.

ATCHISON, a city of Kansas, U.S., on the left bank of the Missouri. It is an important railway center. Pop. (1870) 7054; (1880) 15,106.

A'TÉ, according to Homer, the daughter of Jupiter—or of Eris, as Hesiod says—was a vengeful goddess, ever attending *dysnomia*, or transgression of law, though she herself prompted men to such. She was banished from Olympus by Jove, whom she had incited to take an oath of which he subsequently repented. She then traveled to and fro over the earth with great rapidity, always intent on exercising a pernicious influence upon mankind. But her steps were followed by the goddesses *Litai* (prayers), benevolent daughters of Jove, who healed those who had been afflicted by A. The tragic writers describe A. as the goddess of retribution. Their representations almost identify her with NEMESIS and ERINNYS.

A'TELES (Gr. incomplete), a genus of American monkeys, of the division with long prehensile tails, to which the name SAPAJOU (q. v.) is sometimes collectively applied. In the genus A., the head is round, and the facial angle about 60°; the limbs are remarkably long and slender, upon which account the English name SPIDER MONKEY (q. v.) is sometimes used as a generic designation; and the fore-limbs are either entirely destitute of a thumb, or have a mere rudimentary one, a peculiarity in allusion to which the name *A.* was given. The name Coaita or Quata is frequently given to some of the species of A., but is sometimes limited to *A. Paniscus*, as Spider Monkey sometimes is to *A. arachnoides*. One of the best known species is the Marimonda (*A. Belzebub*), a common monkey of Guiana, and which occurs in immense numbers on the banks of the Orinoco.

ATELIERS NATIONAUX, or NATIONAL WORKSHOPS, a term under which such institutions became renowned in connection with the French revolution of 1848. In almost all countries and ages, there have been projects for organizing labor under public authority, designed generally for the benevolent purpose of obviating the distress caused by casual depressions in trade. However distinctly the laws of political economy were laid down on the point, it could always be said that these were merely theoretic, and therefore, this one instance of practical experiment, however calamitous in its day, left behind it a valuable lesson. The principles of political economy on this matter are—that competition only can fix the extent to which labor is required in any department, and the rate at which it must be remunerated; that it is this competition which gives the workman a stimulus to labor effectively and profitably; and that if this stimulus were withdrawn, and all were paid alike, whether they worked well or ill, all would work ill, the public would be losers, and the large fund out of which laborers are supported under the competitive system would cease to exist. Immediately on the formation of the Provisional Government in February 1848, a permanent department was established called *The Committee of the Government for the Workmen*. This establishment acted on the doctrine, that all workmen were entitled to have a living provided for them on a certain uniform scale. They did not forcibly abolish private employment, but they held out inducements which made workmen leave and employers break up the existing establishments. Consequently, nearly all the Parisian workmen threw themselves on the government, and others flocked in from other quarters in alarming numbers. It was found that these crowds of men, who claimed the privilege of employment by the state, had very little idea of the duty of working, even were there distinct employment for them. But when the body had increased to considerably above a hundred thousand the government found that they had this ever increasing mass to feed, and nothing to feed them with, since trade thus meddled with was in reality ruined. It was consequently found necessary to put an end to the system, and the result was the bloody battle of Paris, which brought about the restoration of despotism. One incidental experiment will perhaps best explain the ruinous tendency of the whole system. In the Hôtel Clichy, 1500 tailors were assembled to make uniforms for the new *garde mobile*. The men were to receive among them for the completed work as much as an army-contractor would have demanded. In the meantime, they were paid two francs a day of subsistence money; the rest was to be divided among them at the end. The men were buoyed up with the notion that they were to receive not only their own proper wages, but the indefinite and enormous sum which they supposed to form the profit of the contractor, forgetting that such profit seldom exceeds about 3 per cent. Their disappointment was great when they found nothing to divide. There was, in fact a loss. When paid their two francs—not much more than half of what they obtained when employed by a contractor—they were paid more than the value of their labor and the profit of the transaction to boot. The reason is pretty obvious. Each man working for himself, and paid for his work on the competitive system, exerted himself; but when one man's exertions went virtually for nothing, unless he got the 1499 others to exert themselves to the same amount, all were alike lazy.

ATELLA'NÆ, *Fabulæ Atellanæ* (also styled *Ludi Osci*), a kind of popular drama in Rome, first introduced from Atella, a town in Campania, between Capua and Naples. After the Greek drama had been brought to Rome by Livius Andronicus, the old *Fabulæ Atellanæ* were still retained as interludes and after-pieces. They are not to be confounded with the Greek satiric drama, although the character of both was to some extent the same. In the latter, satyrs figured; while the former personated real Oscan characters. The *Macchus* and *Bucco* of the *Fabulæ Atellanæ* may be considered the origin of the modern Italian arlecchino (harlequin), and other characters of the same stamp. They were the favorite characters; spoke the Oscan dialect, and excited laughter by its quaint old-fashioned words and phrases. The A. were neither so dignified as the *comœdia prætextata*, nor so low as the *comœdia tabernaria*, but indulged in a kind of genial and decent drollery. The caricature was at first always pleasant, and though quizzical, it did not lapse into obscenity, like the *mimi*. Respectable Roman youths, who could not appear as actors in the regular Greek drama without losing *caste*, were allowed to take part in the *A*. A few fragments of these popular farces have been collected by Bothe in his *Poetarum Latinorum Scenicorum Fragmenta* (Leip. 1834). See also Munk, *De Fabulis Atellanis* (Leip. 1840).

A TE'MPO (Ital.), in time. A term used to denote that, after some short relaxation in the time, the performer must return to the original degree of movement.

A TE'MPO GIU'STO (Ital.), in correct time. A term used to denote that, after a recitative, the performer should keep the music true and correct, which, during the recitative, had been altered to suit the action and passion of the scene.

A'TESHGA (the Place of Fire), a spot on the peninsula of Apsheron, on the west coast of the Caspian Sea. It is considered sacred by the Guebres, or Persian Fire-worshipers, who visit it in large numbers, and bow before the holy flames which issue from the bituminous soil. It is about a mile in diameter, and from its center, in clear dry weather, creeps forth a blue flame (caused by the ignition of the naphtha), which shines with great brightness by night.

ATE'SSA, a town of south Italy, in the province of Chieti, and 23 miles south-south-east from Chieti. It has a beautiful collegiate church, and several other churches and convents. Pop. (1881) 5197.

ATEU'CHUS. See BEETLE and SCARABÆUS.

ATH, or AATH, a strongly fortified town in the province of Hainault, Belgium, situated on the Dender, in lat. 50° 36′ N., long. 3° 46′ E. It has an arsenal, hospital, and college, and important manufactures of linen, calicoes, lace, gloves, cutlery, large hammers, &c., and carries on a brisk trade. Pop. 8260. The ancient church of St. Julien in A. is noted for its extraordinarily high tower. The town has been several times besieged and taken: in 1697, by Catinat and Vauban; in 1706, by the allied forces under the Dutch general Owerkerke; in 1745, by the French after a short siege; and in 1792, by the forces of the Republic under Berneron.

ATHABA'SCA, a river and lake in the northwest of America, forming part of the great basin of the Mackenzie, and lying, therefore, in the Northwest Territory of the Canadian Dominion. The *river* rises in the Rocky Mountains near Mount Brown, the highest point in the range. Its actual source is the small lake, already mentioned under the head of AMERICA as the Committee's Punch Bowl, which sends its tribute at once through the A. to the Frozen Ocean, and through the Columbia to the Pacific. Its general course is north-east, till, after passing through A. Lake, or rather crossing its west end, it turns towards the north-west, and, after a course of 30 or 40 miles, unites with the Peace River, from beyond the Rocky Mountains, to form the Slave River, which, again, after passing through Great Slave Lake, takes the name of the Mackenzie.—*Lake* A. receives nearly all its waters from the A. river, and is probably unique in this, that its principal feeder traverses not its length but its breadth, and that not in its middle, but at its extremity. The lake's single outlet is the river A.—A. is the name of a new division of the Canadian North-west, between British Columbia and the A. River. It contains the fertile Peace River districts.

ATHALI'AH, the daughter of Ahab, king of Israel, married Jehoram, king of Judah, who died 885 B.C. After the death of her son Ahaziah, who succeeded him, but reigned for only one year, she paved her own way to the throne by putting to death (as she supposed) all the seed-royal. 'But Jehosheba, the daughter of king Jehoram, sister of Ahazia, took Joash, the son of Ahaziah, and stole him from among the king's sons, who were slain.' The young prince thus rescued was privately educated in the temple, and, after A. had reigned six years, the high-priest Jehoiada placed Joash on the throne (878 B.C.). A., hearing the noise attending the coronation, hastened to the temple, where the people were shouting, 'God save the king!' As she looked round in astonishment on the young king, whom she had supposed to be dead, surrounded by priests, Levites, rulers, captains, and a rejoicing multitude, she 'rent her clothes, and cried, "Treason! treason!"' By the command of the high-priest, she was led out of the temple, and slain in the gateway of the palace. The house of Baal, with its altars and images, was broken down. This narrative (2 Kings xi.; 2 Chronicles xxi. 6, xxii. 10—12, xxiii.) is the subject of Racine's drama *Athalie*.

ATHA'NARIC, a king of the Western Goths, whose settlements lay on the north bank of the Lower Danube, in the 4th c. Having taken advantage of the weakness of the Roman empire when the imperial armies were engaged in suppressing the rebellion of Procopius, war was declared against him by the Emperor Valens. A. acted strictly on the defensive during two campaigns, in which the Romans gained no advantage over him; but in the third year of the war (369 A.D.), he hazarded a general battle, and was defeated, whereupon he sued for peace, and, with that object, had a conference with Valens in a boat on the Danube. Peace was concluded, and A. had his attention occupied in settling dissensions arising out of the Arian controversy which then agitated his people, when the first advance of the Huns on Europe alarmed the Gothic nation. A. attempted to secure the eastern borders of his kingdom; but the Huns forced the passages of the Dnieper, defeated the Goths, and advanced in great force into the plains of Dacia. When, in 374, the Western Goths were received by the Romans as allies, and had settlements granted them on the south of the Danube, A., with a part of his people, refused to accompany them, removing to the west, and fortifying himself against the new enemy. In 380, however, he was obliged to retire, when he accepted the hospitality of the Empire, and removed to Constantinople, where he met with a cordial and honorable reception by the Emperor Theodosius. At this time died Fritigern, the king of the Goths that had settled on the south of the Danube; and A. being made king of the whole Western Gothic nation, concluded a treaty of peace, in behalf of the whole, which had the effect of incorporating that people with the other subjects of the empire. He died at Constantinople in 381.

ATHANA'SIAN CREED, the third of the three œcumenical symbols, derived its name from its composition being attributed to Athanasius; it is also known, from its initial words in Latin, as the creed *Quicunque Vult*. The first part of this creed contains a detailed exposition of the Trinity; the second, the doctrine of the incarnation. Modern criticism has called in question the title of Athanasius to be considered the author of this creed. It was known as early as the beginning of the 6th c., but not under its present name. It is spoken of as 'Athanasius's Tract on the Trinity,' in some Articles of the middle of the 8th c., and is supposed to be alluded to, 'as the Faith of the holy prelate Athanasius,' in the Council of Autun, about 670. Athanasius himself makes no mention of this creed, although its doctrines are essentially his; nor do any of the church fathers. Other two circumstances speak against its authenticity: it is in Latin, and Athanasius wrote in Greek; the expressions, again, are different from those used by Athanasius in speaking of the same things. By Protestants, therefore, and even by most Catholics, its Athanasian origin has been given up, and its production has been assigned with most probability to the 5th c., and to Gaul; Hilary, Archbishop of Arles (about 430), being conjectured to be the author. The title of Athanasian probably became attached to it during the Arian controversy in Gaul, as being an exposition of the system of doctrine which was opposed to the Arian system, and which would naturally be called Athanasian from its chief propounder. It was received into the public offices of the Gallic Church in the 7th c., and by the middle of the 10th c. it was adopted at Rome and all over the West. In Britain it was probably in use as early as 800. The Greek Church was late in receiving it, and even then not without altering the article concerning the 'Procession of the Holy Ghost.' The Reformers adhered to the A.C., and Luther called it 'a bulwark of the Apostles' Creed.' Even those Churches that do not in any way acknowledge it as a symbol (as the Presbyterian Churches of Britain and America, as well as the Independents) generally accept its doctrines.

The A. C. is the most rigid and intolerant of the Catholic symbols, and has given rise to much controversy; and though still generally received by Protestants as well as Catholics, the regard once had for it has declined. The points in this creed that give offence to some are defended by others, on the plea that it was not drawn up for the sake of gratuitously dogmatizing on abstruse speculative truths, but to counteract other dogmas which were held to be dangerously heretical. Waterland, in his *Critical History of the Athanasian Creed*, says: 'The use of it will hardly be thought superfluous so long as there are any Arians, Photinians, Sabellians, Macedonians, Apollinarians, Nestorians, or Eutychians, in these parts.' (See Articles under these heads.) With respect to what are called the 'damnatory clauses' (the clauses, namely: 'Which Faith except every one do keep whole and undefiled, without doubt he shall perish everlastingly;' and: 'This

is the Catholic faith, which except a man believe faithfully, he cannot be saved'), the churches which adopt the creed, do not mean by them to imprecate curses, but to declare, as a logical sequence of a true faith being necessary to salvation, that those who do not hold the true faith are in danger of perishing; as it is said, Mark xvi. 16, 'He that believeth not shall be damned.' These clauses are also held to apply to those who deny the substance of the Christian religion, and not infallibly to every person who may be in error as to any one particular article. A rubric to this effect was drawn up by the commissioners appointed in 1689 for the review of the English Common Prayer Book, but none of their suggestions took effect. Compare also the 18th Article of the Church of England with these clauses.

ATHANA'SIUS, Primate of Egypt, was born in Alexandria about the year 296 A.D. There are no particulars on record of his lineage or his parents. Alexander, then officiating as primate or patriarch of Alexandria, brought him up in his own family, and superintended his education, with the view of his entering on the Christian ministry. In his youth, he often visited the celebrated hermit St. Antony, and embraced for a time the ascetic life with the venerable recluse. He was but a youth and only a deacon when appointed a member of the first general council at Nice, in which he distinguished himself by his erudition and his eloquence.

His patron, Alexander, having died in the following year, he was duly elected to the primacy by the clergy and people; and was but newly installed in his office, when Arius, who had been banished at the time of the condemnation of his doctrine at Nice, was recalled, and made a recantation of his erroneous principles. A., it is said, refused on this occasion to comply with the will of the emperor that the heretic should be restored to communion. On this account, and in consequence of several other charges brought against him by the Arian party, he was summoned by the Emperor Constantine to appear before the synod of Tyre, in 335 A.D., which deposed him from his office. His sentence was confirmed by the synod of Jerusalem in the following year, when he was banished to Treves. In 338, Constantius, now emperor of the East, though unfriendly to the principles of the Trinitarians, recalled A. from his banishment, and restored him to the primacy at Alexandria. His entrance into the city was like a triumphal procession; but the Arians soon rose against him, and (in 341) he was again condemned by the council of 90 Arian bishops assembled at Antioch. Against this decision a protest was made by 100 orthodox bishops at Alexandria, and in a council held at Sardis, 300 bishops, with Julius, bishop of Rome, at their head, confirmed the decision in favor of A., who was again replaced in his office (349 A.D.). The Arians once more acquired the ascendency after Constantius (in 353) had been made Emperor of both the East and West; for in that year A. was condemned by a council held at Arles, and the sentence was confirmed by another held at Milan in 355, the influence of the sovereign being strongly exerted to secure his condemnation. As the resolute patriarch had declared that he would not leave his place without an express order from the emperor, violent means were resorted to for his expulsion. While engaged in conducting divine service, he was interrupted by a company of soldiers, from whom he made his escape into the Egyptian desert. A price was set on his head; and to avoid his persecutors, he retired from the usual haunts of the anchorets to a remote desert in Upper Egypt, where he was attended by one faithful follower. Here he wrote several works to confirm orthodox Christians into their faith. On the accession of Julian to the imperial throne, toleration was proclaimed to all religions, and A. returned to his former position as patriarch of Alexandria (361 A.D.). His next controversy was with the heathen subjects of Julian, to whom the patriarch, by his zeal in opposing their religion, had made himself very offensive. To save his life, he was compelled again to flee from Alexandria, and remained concealed in the Theban desert, until 363, when Jovian ascended the throne. After holding office again as patriarch for only a short space of time, he was expelled anew by the Arians, under the Emperor Valens. A. now found refuge in the tomb of his father, where he remained hidden four months, until Valens, moved by petitions from the orthodox Alexandrians, restored the patriarch to his see, in which he continued till his death in 373 A.D.

A. was the leading ecclesiastic in the most trying period of the history of the early Christian Church. His ability, his conscientiousness, his judiciousness and wisdom, his fearlessness in the storms of opposition, his activity and patience, all mark him out as an ornament of the age, as well as the most influental public character in matters of religion. Though twenty years of his life were spent either in exile, or what was equivalent to it, yet his prudence and steadfastness, combined with the support of a large party, crowned his exertion with complete success. He was a clear thinker, and as a speaker, was distinguished for extemporaneous precision, force, and persuasiveness.

His writings are polemical, historical, and moral; all marked by a style simple, cogent, and clear. The polemical works treat chiefly of the doctrines of the Trinity, the incarnation of our Saviour, and the divinity of the Holy Spirit.

The earliest edition of the collected works of A. in the original Greek appeared in two volumes, folio, at Heidelberg in 1600. It was accompanied with a Latin translation. The most complete edition is that published at Padua in 1777. A.'s Four Orations against the Arians, and his Oration against the Gentiles, were translated by S. Parker (Oxford, 1713); also, his Treatise on the Incarnation of the Word was translated by W. Whiston, forming part of that gentleman's *Collection of Ancient Monuments Relating to the Trinity and Incarnation*, London in 1713. The Epistles of A. in defence of the Nicene Creed, and on the Councils of Arimínum and Seleucia, together with his first Oration against the Arians, were translated, with notes, by the Rev. John Henry Newman, Oxford (1842).

A'THEISM, a word of modern formation, from Gr. *atheos*, 'without God,' signifies the doctrine of those who deny the existence of a God. The term atheist conveys such terrible associations to almost all minds, that there is perhaps no reproach from which men shrink more; and yet it has been freely applied by the zealous of all ages to those whose notions of the invisible powers differed from their own. The imputation is the most damaging that can be made, and it requires only a little ingenuity to make out a case of *constructive* A. from any set of opinions at all differing from the common. Thus, the ancient Greeks accused some of their philosophers of A. though they did not deny the existence of a divinity, but only rejected the common notions of a plurality of gods. And in the Christian Church, after the doctrine of the Trinity had been fixed and defined, those that denied the divinity of Christ were not unusually branded as atheists.

The horror inspired by this name is strikingly shown in the way it is repudiated by the adherents of pantheism (q. v.), who reject a personal god, and substitute the idealized principle of order that pervades the universe. It is hardly to be denied, however, that the idea associated with the word God has hitherto involved personality as its very essence; and except for the purpose of avoiding odium, there could be little propriety in retaining the word when the notion is so completely altered.

The view of those who, like Kant, believe it impossible to *demonstrate* satisfactorily the existence of God, though it must be held on other grounds, is called *speculative* A., in opposition to the *dogmatic* A. of those who attempt to disprove that existence.

A'THELNEY, ISLE OF, a marsh at the junction of the rivers Tone and Parret, in the middle of Somersetshire. Here Alfred, when driven from his throne, hid from his enemies, and founded, in 888, a Benedictine abbey, now entirely gone. Among the many relics found in this spot is a ring of Alfred's, preserved in the Oxford Museum. The name Athelney means 'island of the nobles,' or 'royal island.'

A'THELSTAN, the grandson of Alfred the Great, was born about 895 A.D., and was the first Saxon monarch who took the title of king of England, Alfred himself only assuming that of king of the Anglo-Saxons. He was crowned at Kingston-upon-Thames in 925, and seems to have possessed both great ambition and high talent. It is supposed that his design was to unite in subjection to his single sway the entire island of Britain. His resources, however, were not equal to the undertaking, and he had to content himself with the acquisition of portions of Cornwall and Wales. On the death of Sigtric, king of Northumbria, who had married one of his daughters, A. took possession of his dominions. This excited the alarm and animosity of the neighboring states, and a league, composed of Welsh, Scotch, and Irish, was formed against the English king, for the purpose of placing Anlaff, the son of Sigtric, on his father's throne. A fierce and decisive battle was fought at Brunenburgh, in which the allies were utterly defeated, and which became famous in Saxon song. After this, the reputation of A. spread into the continent. His sisters were married into the royal families of France and Germany, and he himself enjoyed the greatest influence and consideration. At home, he exhibited a deep interest in the welfare of his people, improved the laws, built monasteries, and encouraged the translation of the Bible into the vernacular. He died at Gloucester on the 25th October 941, in his 47th year.

ATHENÆ'UM (Gr. *Athenaion*), the Temple of Minerva (Gr. *Athene*) at Athens, which was frequented by poets, learned men, and rhetoricians, who there read aloud their works.—The A. in Rome was a school or college erected, by the Emperor Hadrian, for the study of poetry and rhetoric, with a regular staff of professors. It existed for a long period. In the time of Theodosius II., it had three professors of oratory, ten of grammar, five of sophistry or dialectics, one of philosophy, and two of jurisprudence.—In modern times, the name A. has been revived as an appellation for certain literary institutions, and also as a collective title for literary essays and reviews. A. is the title of two weekly journals of

literature, science, and art—one published in London, the other in Paris.

ATHENÆ'US, a Greek *rhetor* and *littérateur*, born at Naucratis in Egypt. He lived at the close of the second and beginning of the third century. His work, entitled *Deipnosophistæ* (Banquet of the Learned), in fifteen books, but of which we possess the first two, and parts of the third, eleventh, and fifteenth only in an abridged form, is very interesting, as it has preserved for us copious fragments of old writers, and treats, in the form of dialogue, of almost all the topics of ancient Greek manners, private and public life, arts, sciences, &c. It is not a work indicative of any high ability; the author, for the most part appears in the character of an agreeable, well-read, epicurean gentleman, excessively fond of *tit-bits*, both of scandal and cookery. He tells many stories of the disadvantage of people whom history praises; but these we are by no means bound to believe, nor, indeed, is he a man whose opinions are worth much on any subject; but as a melange of literary, social, and domestic gossip, the value of the work is unrivaled. A. appears to have read enormously; he states that he had made extracts himself from 800 plays of the middle comedy alone. But his dialogue is prolix and lumbering; and his work is not irradiated by a single gleam of genius, and has only achieved immortality through being a store-house of miscellaneous information, that otherwise would have been lost to the race. The best editions are by Schweighäuser (14 vols. Strasb. 1801—1807), and Dindorf (3 vols. Leip. 1827). There is an English translation of A. in Bohn's Classical Library (3 vols. Lond. 1854).

ATHENA'GORAS, an early Christian philosopher, who taught first at Athens, and afterwards at Alexandria. He is one of the oldest of the apologetical writers, and is favorably know by his *Legatio pro Christianis*, which he addressed to the Emperor Marcus Aurelius in the year 177 A.D. He therein defended the Christians against the monstrous accusations of the heathen, viz., that they were guilty of atheism, incest, and cannibalism. His work is written in a philosophical spirit, and is marked by great clearness and cogency of style. We likewise possess a valuable treatise of his on the resurrection of the dead.

ATHENA'IS, an Athenian of distinguished beauty, the daughter of Leontinos the Sophist, was born about the close of the 4th c., A.D. She received from her father a superior education, being skilled in Greek and Latin literature, rhetoric, astronomy, geometry, and the science of arithmetic. After his death, she repaired to Constantinople, to obtain justice for the harsh treatment to which her brother subjected her. Here her beauty and intelligence made her the favorite of Augusta Pulcheria, sister of Theodosius II., who considered that she would make an excellent wife for the emperor. In 421, A. having been baptized and named Eudocia, was married to Theodosius, and in 438, made a splendid pilgrimage to Jerusalem, bringing with her, on her return, the supposed relics of the first martyr, Stephen. Afterwards, she lost the favor of Pulcheria—the real manager of affairs—and was banished from court. She then retired to Jerusalem, where she suffered many persecutions, and died, in the odor of sanctity, 460 A.D. A. wrote an epic poem on the war of Theodosius against the Persians, and several other metrical works which have not been preserved.

A'THENS, the capital of the ancient state of Attica, is said to have been founded by Cecrops, about 1550 B.C., and styled Cecropia; but even the ancients themselves doubted this tradition. Equally uncertain is the story that it was first styled A., in honor of Athene, during the reign of Erichthonius. The ancient citadel was situated on the top of a square craggy rock, 150 feet high, with a flat summit, 1000 feet long, and 500 broad. Gradually, as population increased, A extended itself over the wide and beautiful plain below. This increase is said to have been occasioned by the organization of the twelve Attic tribes into a political confederacy or union by Theseus, the brightest figure that shines through the 'dark ages' of Attic history. The position of A. near the Gulf of Saronica, opposite the eastern coast of the Peloponnesus, was favorable to the acquirement of naval power. The city, which was distant four or five miles from the sea, possessed three harbors, all situated on the south-west, and connected with it by walls. The oldest of these harbors was Phalerum. It was also the nearest to the city, and accessible at all times by a dry road. The Peiræus was first used as a harbor by Themistocles. Munychia was the Acropolis of the whole rocky peninsula termed the Peiræus, and of immense importance strategetically. The two last harbors were connected with the city by the famous 'long walls,' of which we read so much in Athenian history. They were forty stadia, or nearly five miles in length. Two streams flowed in the vicinity of A.; on the east side, the Ilissus, which also washed the southern part of the city; and on the west, the Cephisus, about a mile and a half beyond the walls. To the west lay Salamis, with Eleusis on the north-west, Phylæ and Decelea on the north, Marathon on the north-east, and Hymettus on the south. All along the coast rose splendid buildings.

The whole of the magnificent prospect was crowned by the Acropolis, where all the most glorious monuments of A. were assembled. First rose the Parthenon (q. v.), or Temple of Minerva, a pile which even now, after the lapse of centuries, remains among the wonders of the world.

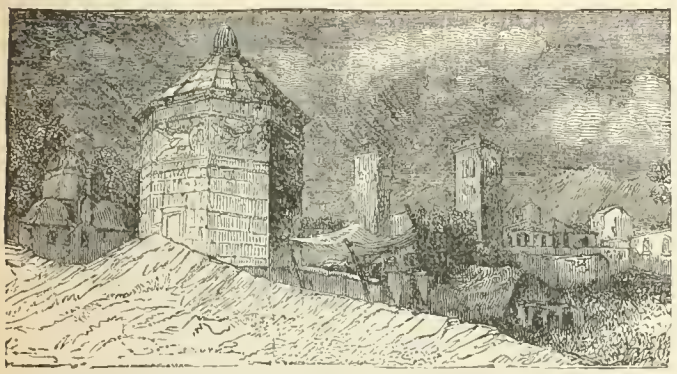
The Propylæa, all built of white marble, formed the entrance to the Parthenon. Close to it, on the north side of the Acropolis, rose the Erechtheium, the most venerated of all Athenian sanctuaries, and connected with the oldest religious history of the city. The whole of it was destroyed by the Persians, but was restored during the Peloponnesian war. Its ruins still exist, and allow us to form a very correct idea of its external form and structure. In some points, it differed from all other examples of Greek temples. But it would be tedious and unprofitable to mention in detail all those magnificent buildings which were the glory of ancient Athens. It is sufficient to say, that gods were never more superbly honored in any land. That enthusiastic love of the beautiful which animated the Athenians, turning their religion into an art, and making worship an education in æsthetics, is nowhere so clearly visible as in their religious architecture. Their mythological faith stood daily before their eyes in monumental splendor, for almost every deity had his temple or shrine in the city. Two of the finest buildings—the Temple of Theseus, and that of Jupiter Olympus—were on the outside of the city; the first to the north-west, the second to the south. The former was both a temple and a tomb, inasmuch as it held the remains of Theseus himself. It was built about 465 B.C., and was therefore older than the Parthenon. It had the privilege of an asylum for slaves, and the large space of ground which it enclosed was frequently used as a muster-ground for the Athenian soldiery. It was built of the favorite Pentelic marble, in the Doric style of architecture, and is the best preserved of all the monuments of ancient Athens. For centuries it was a Christian church, appropriately enough dedicated to St. George, the chivalrous hero of the 'dark ages' of Christianity, as Theseus had been of the 'dark ages' of Attic history; but is now the national museum of the city. The Temple of Jupiter, of which sixteen grand Corinthian columns are still extant, to the south-east of the Acropolis, and near the right bank of the Ilissus, in size, splendor, and beauty, excelled all other Athenian structures. Immense sums of money were expended upon it from the time when it was commenced by Peisistratus, until it was completed by Hadrian, a period of 700 years. The building of it was frequently suspended, so that Philostratus calls it 'a struggle with time.' At the time the Persians sacked the city, it was fortunately only beginning to be built, and so escaped destruction. Aristotle speaks of it as a work of despotic grandeur, and equal to the pyramids of Egypt. The exterior was decorated by about 120 fluted columns, 61 feet in height, and more than 6 feet in diameter. It was 354 feet long, and 171 broad, and contained the celebrated statue of the Olympian Jupiter in ivory and gold, the work of Phidias.

Besides these wonders of art, the city contained places of interest of which the memory will perpetually remain—the Academy where Plato, whose estate lay near it, gave his lessons in a grove of plane-trees adorned with statues; tradition alleged to have belonged originally to Academus. Hipparchus surrounded it with a wall, and Cimon adorned it with walks, fountains, and olive-groves. The Lyceum, the most important of the Athenian gymnasia, where Aristotle lectured; and, near to this, the Cynosarges, where Antisthenes the Cynic expounded his 'harsh and crabbed' doctrine; the hill of the Areiopagus, where the most venerable court of judicature was held; and the Prytaneum, or senate-house. About a quarter of a mile to the west of the Acropolis rises a low hill, which marks the locality of the Pnyx, a place of public assembly, forming a large semicircular area, bounded at the base by a limestone wall, from which projects a pedestal, carved out of the rock, and ascended by steps. This most interesting place has been preserved almost in its integrity, and, as we look around, we are carried back to the times when some six thousand Athenian citizens were here assembled, when the orator, standing upon the pedestal, could survey the Acropolis, with all its temples, the venerable Areopagus, and beyond the city, the extended plains and villages of Attica, with corn-fields, olive-grounds, and vineyards.

A., in its most flourishing period, numbered 21,000 free citizens; from which we may calculate that it contained about 200,000 inhabitants. More than two thousand years have passed over the beautiful city, and still its remains excite the admiration of the world. The Turks surrounded it with wide irregular walls, partly built out of the ruins of the old walls, and containing many fragments of noble columns. Of the Propylæa, the right wing, or Temple of Victory, was destroyed in 1656 by the explosion of a powder-magazine. Six columns, with lofty arches, remain to mark the site of the opposite wing. The interior of the Parthenon was used for some time as a Turkish mosque. Eight columns remain on the east of the front, several colonnades at the sides; and of the back pediment, where the combat of Minerva and Neptune was sculptured, nothing remains save the head of a sea-horse, and two decapitated female figures. Of the pediment in front, several

figures belonging to the group representing the birth of Minerva are preserved in the British Museum, and justly regarded as master-pieces of ancient sculpture. Of all the statues which the Parthenon contained, only one, that of Hadrian, has been preserved. Ruined as it has been, the general aspect of the Parthenon is still sublime. Of the Erechtheium (or temple of Neptunus Erechtheius) considerable vestiges remain, especially the beautiful female figures styled Caryatides.

The situations and vast extent of the two theaters may still be traced, though grain is now grown in the arenas. All these remains belong to the Acropolis. In the city below, there are no such splendid memorials. The Horologium, or octagonal Temple of the Winds (built by Andronicus Kyrrhestes), has been well preserved; but a few fragments found in broken walls are all that remain to tell of the splendid Gymnasium built by Ptolemæus. Beyond the city, the attention of the spectator is arrested by the



Temple of the Winds, Athens.

sublime ruins of the Temple of Jupiter Olympus. Pedestals and inscriptions have been found here and there, sometimes buried in the earth. The sculptures on the friezes of the interior of the Temple of Theseus, representing the exploits of Theseus, have been well preserved, while the external sculptures are almost utterly destroyed. A Turkish burial-place now occupies the hill where the Areiopagus held its sittings. The site of the Lyceum is indicated only by scattered stones, and a modern house and garden occupy the place of the Academy. Scarcely anything remains to show the old magnificence of the harbors Peiræus, Phaleros, and Munychia.

It is probable that, in the time of Pausanias, many structures remained belonging to the period before the Persian war, as Xerxes, during his short time of mastery over A., would scarcely have been able to destroy more than the fortifications and principal public buildings. Themistocles, in his restoration of the city, had chiefly a regard to utility; Cimon paid attention to its decoration; but Pericles far exceeded them in the magnificence of his designs, which were too vast to be carried into effect in later times. The civilization, spreading from A. as its center, raised Macedon and other states into dangerous rivalry. The defeat at Chæroneia was as fatal to the fine arts as to the liberty of the Athenians. After the works at the Peiræus had been destroyed by Sulla, the naval power, and with it the whole political importance of A., rapidly declined. It is true that the city was treated leniently by its conquerors; the temples and statues were preserved from violation, and A., with all the trophies of eight centuries of greatness, remained under the Antonines; but the free national spirit of the Athenians had departed for ever, and slowly, but surely, the fine arts shared the fate of Grecian liberty.

Their treasures, which had been spared by the Roman emperors, were gradually stolen away by various thievish collectors, especially for the decoration of Byzantium, or were destroyed by irreflective Christian zeal and barbarian invasion. About 420 A.D., the ancient religion and temple-service of A. had entirely disappeared; afterwards, the schools of philosophy were closed by Justinian, and Greek mythology was gradually forgotten. St. George took the place of Theseus, and the Parthenon was converted into a church. The surviving industry of A. was injured by Roger of Sicily, who removed its silk manufactures. In 1456, A. fell into the hands of Omar, and, to consummate its degradation, under the low, sensual Turks, the city of Athene was regarded as an appanage of the harem, and governed by a black eunuch. The Venetians, having captured the city in 1687, intended to carry away as a trophy the quadriga of victory from the west front of the Parthenon, but shattered it in their attempt to remove it. In 1688, A. was again delivered into the hands of the Turks, and the work of demolition now proceeds rapidly. The grand remains of antiquity were used as quarries to supply materials for ordinary buildings, and, in the course of another century, the city was reduced to its lowest point of degradation.

Modern A. (styled by the Turks Athina or Setines) is now the capital of the new kingdom of Greece. Previous to the Greek revolution (1821), it was a provincial city of inferior importance, the seat of a Greek metropolitan bishop, and under the jurisdiction of the Turkish governor in Eubœa. In 1821, the war of liberation commenced, and the Turks surrendered Athens in the following year; but again captured it in 1826, and took the Acropolis in 1827. After this it was left in ruins until 1830 when Attica was declared united with Greece by the protocol of the London Conference. In 1834, Otho, the son of the Bavarian monarch, who had been elected to the sovereignty of the new kingdom, removed his residence from Nauplia to A. Improvements now proceeded rapidly: Turkish manners and customs disappeared; the contemptible wooden houses and crooked streets were superseded by new ones—among which the Hermes, Æolus, Athene, and New Stadion streets are conspicuous; and in 1836, the foundation of a new palace was laid, and it was completed in 1843. The municipal affairs of A. are now regulated by a mayor (demarchos) and council elected by the citizens. Modern A. has a gymnasium, a library enriched with many donations from France and Germany, and a university, where about 52 professors and tutors are engaged. The number of students is about twelve hundred. Several interesting works have been printed in A. The French government has founded an Archæological Institute, and several missionary societies have branches here. A. has several printing establishments, soap-works, leather works, and silk and cotton factories. Pop. (1879) 63,374.

Political History of A.—It was the Ionic race that manifested most signally the distinguishing characters of Greek civilization; and of this portion of Hellas, A., in the brilliant part of its history, stands out most prominently. According to tradition, its political power was first established by Theseus, king of Attica, who made A. the metropolis. Here he instituted the great popular festival of the Panathenæa, and, by encouraging settlements in the city, greatly increased its population. He divided the citizens into three classes: nobility, agriculturists, and mechanics. Until the death of Codrus in 1068 B.C., A. was governed by kings; afterwards, by archons elected from the nobility. The time of holding office was limited to ten years in 752 B.C., and to one year in 683 B.C., when nine archons were annually elected, one being called the *archon eponymus*, because the year was distinguished by his name. Here begins the authentic history of A. These archons, together with the council of nobles, afterwards called the Areiopagus, exercised the whole power of the state, and administered justice. The Athenian government was thus, like all other Hellenic governments, an oligarchy; but the changes introduced by the archon Solon, 594 B.C., though remarkably moderate, laid the foundation of that democratic constitution which was afterwards perfected by Cleisthenes. The condition of the population at the time of Solon was one of extreme suffering and discord, arising chiefly from the oppressive execution, by the aristocratic archons, of the law of debtor and creditor. This law was of old extremely harsh in Greece as well as in Rome; it assigned the debtor that could not fulfil his contract as the slave of his creditor. The great part of the soil of Attica was in the hands of the rich, and the mass of the population, who tilled the lands as tenants, were either in hopeless arrears, or already, with their families actual slaves. Driven to desperation, the populace were ready to rise in mutiny; the oligarchy were afraid or unable to enforce the laws; and thus it was agreed to confer dictatorial power on Solon, well known for his wisdom, integrity, and sympathy with the people, and allow him to solve the problem. The disease being desperate, Solon applied the desperate remedy of abolishing existing contracts, liberating those that had been reduced to slavery, and forbidding for the future any one from pledging his own person or that of a member of his family. He next reformed the political constitution by dividing the freemen into four classes, according to the amount of their property. It was only the richer classes that paid taxes and were eligible to the offices of state; but all had votes in the assembly that elected the archons, and all sat in judgment on their past conduct, on the expiry of their year of office. The government, though still oligarchical, was thus modified by popular control. Its free operation was for some time (560—510 B.C.) interrupted by the usurpation of Peisistratus and his sons, whose *tyranny*, however, was mild and enlightened, the forms at least of the Solonian constitution being preserved.

On the banishment of the Peisistratidæ (510 B.C.), a further political reform was introduced by Cleisthenes, who extended the basis of the constitution, and rendered it essentially democratic. To Cleisthenes is ascribed the origin of the practice called *ostracism* (q. v.).

Then followed the brilliant period of the Persian war, when out of the circumstances which had seemed to threaten destruction, A. rose to the highest point of power and prosperity. Miltiades at Marathon, and Themistocles at Salamis, gained the victories which

infused new courage and enthusiasm into the Greek nation. The period between the Persian war and the time of Alexander the Great, or from 500 to 336 B.C., was the most glorious in Athenian history; and in 444, Cimon and Pericles raised the city to its highest point of grandeur and beauty. But under Pericles, the beginning of a decline took place, through the decay of ancient morals and the Peloponnesian war, which ended in the capture of A. by the Lacedæmonians. After this, A. retained only the shadow of its former power and dignity. The thirty appointed ministers of government were, in fact, so many tyrants, supported by the Lacedæmonian army. After eight months of despotism had been endured, the tyrants were expelled by Thrasybulus, a free constitution was restored to A., and a new period of prosperity commenced. But it was not destined to endure long; a formidable foe, Philip of Macedon, now appeared in the north. The Athenians having opposed him in the Phocian war, Philip took from them several of their colonies. Then followed the defeat of the Athenians at Chæroneia (338 B.C.), a fatal blow to Greece. A. with other states became subject to Macedon. The free spirit of the citizens was broken, and in moral character they degenerated. After Alexander's death, a fruitless attempt was made to regain their liberty. Antipater instituted an oligarchy of wealth. Soon afterwards, A. was taken by Cassander, and placed under the rule of Demetrius Phalereus, who employed his power wisely and beneficently. Once more the old constitution of A. was restored by Demetrius Poliocretes, and a short interval of independence was enjoyed, until the city was taken by Antigonus Gonatas. After liberating themselves from the dominion of Macedon, and joining the Achaian confederacy, the Athenians were so misguided as to support Mithridates against the Romans. The last error was fatal. Sulla conquered A., destroying the port of the Peiræus, and left only the appearance of liberty and independence, which entirely vanished in the time of Vespasian. Still, after the spirit of liberty and progress had departed, A. long remained safe from spoliation. The Romans, in their respect for Grecian pre-eminence in art and philosophy, and moved also by religious reverence, long regarded Athens as a captive too noble and beautiful to suffer any indignity.

A'THENS, a name applied to twenty-three places in the United States. The most important of them is a thriving town in Georgia, 92 miles to the west-north-west of Augusta. It is the terminus of a branch-railway, which joins the Georgia Central. It contains several cotton factories, and is the market for an extensive cotton-growing region. It is the seat also of the university of Georgia, and has three newspapers. Pop. (1871) 4251; (1881) 6099.

A'THERINE (*Atheri'na*), a genus of small fishes, allied to the Mullet family (*Mugilidæ*), but latterly separated into a distinct family, *Atherinidæ*. The Atherines have more than twice as many vertebræ as the Mullets; they are of a rather slender form, but few of them exceed six inches in length. They have a protractile mouth, and very small teeth; some are quite toothless. Almost all the known species, which are numerous, and found in the seas of different parts of the world, have a broad silvery band along each flank. Some of them are much esteemed for their delicacy. They all congregate in great shoals. They abound in the Mediterranean. One species, *A. Presbyter*, is very common on the south coast of England and on some parts of the coast of Ireland, but is rare on the east coast of Britain.

Atherine (*Atherina Presbyter*).

In the markets of some of the southern towns of England where the Smelt (q. v.) is unknown, it is sold under that name: in Brighton and some other places, it is called *Sand Smelt*. Where this fish abounds, it is often taken by anglers from the shore, biting readily at almost any bait.

ATHERO'MA, or 'fatty deposit,' is generally found in the tissues of aged persons, or those who have lived dissipated and ill-nourished lives. In appearance, it is yellow and cheesy, showing under the microscope fatty granules and crystals of cholesterine. Its most common situation is between the middle and inner coats of arteries, and is dangerous, inasmuch as it interferes with the elasticity of the arterial tube, rendering it more liable to injury, and less able to repair itself, should any occur. A. generally precedes aneurism (q. v.). Cysts filled with contents resembling bread-sauce, which frequently occur in the scalp, are termed atheromatous tumors.

A'THERSTONE, a market-town of Warwickshire, England, on the borders of Leicestershire, 16 miles north-east from Birmingham; in a valley surrounded by finely wooded hills, on the Roman road called Watling Street, the Trent Valley Railway, and the Coventry and Fazeley Canal. The town is irregularly built; many of the houses are very ancient; the old houses are of stone, the modern ones of brick. Some of the modern churches and other public buildings are handsome structures. Hats, stockings, and ribbons are manufactured here. Pop. (1871) 3661.

A'THLETE (Gr. *athleo*, to contend), the name given to a combatant, pugilist, wrestler, or runner, in ancient Greece. Athletics were studied in Greece as a branch of art, and led to several useful rules of diet, exercise, &c., applicable to ordinary modes of life. Bodily strength and activity were so highly honored by the Greeks, that the A. held a position in society totally different from that of the modern pugilist. When he proposed to enter the lists at the Olympic or other public games, he was examined with regard to his birth, social position, and moral character. A herald then stepped forth and called upon any one, if he knew aught disgraceful to the candidate, to state it. Even men of genius contended for the palm in athletic exercises. Chrysippus and Cleanthes, the famous philosophers, were victorious athletes, or, at least, *agonistæ*, i. e., persons who pursued gymnastic exercises, not as a profession, but for the sake of exercise, just as at the present day we have gentlemen-cricketers, amateur-pugilists, &c. The profound and eloquent Plato appeared among the wrestlers in the Isthmian games at Corinth, and also in the Pythian games at Sicyon. Even the meditative Pythagoras is said to have gained a prize at Elis, and gave instructions for athletic training to Eurymenes, who afterwards gained a prize at the same place. So great was the honor of an Olympian victor, that his native city was regarded as ennobled by his success, and he himself considered sacred. He entered the city through a special breach made in the walls; he was supported at the public expense; and when he died, was honored with a public funeral. Euthymus, of Locri in Italy, who had, with only one exception, been regularly victorious at Elis, was honored with a statue, to which, even during his lifetime, homage was paid by command of an oracle. Athletic sports were first witnessed at Rome 186 B.C. They were introduced by M. Fulvius at the end of the Ætolian war, and became excessively popular in the time of the emperors. At Rome, the athletes formed a corporation.

ATHLO'NE, a small town in the center of Ireland, on both sides of the Shannon, chiefly in the county of Westmeath, but partly in that of Roscommon. It is the largest town between Dublin and Galway, and lies on a commanding situation, 3 miles below Lough Ree, in a carboniferous lime-stone district. The chief manufactures are felt-hats, friezes, linens, and stays. A canal here, a mile long, enables large river-steamers to navigate the Shannon for 116 miles, from Killaloe to Carrick-on-Shannon, uninterrupted by the river-rapids. The Shannon is crossed by a fine bow-string and lattice iron bridge of two arches, 175 and 40 feet span. Pop. (1871) 6565; (1881) 6901. A. sends one member to parliament. A. Castle, on the Roscommon bank of the Shannon, was founded in the reign of King John, and has now been rendered one of the chief military positions in Ireland. The fortifications cover 15 acres, and contain barracks for 1500 men.

A'THOLE (Pleasant Land), a district of 450 square miles, in the north of Perthshire. It occupies a great part of the southern slopes of the Grampian mountains, and is intersected by many narrow glens, down which flow the rapid tributaries of the Tay. It is chiefly composed of gneiss and quartz rock, with beds of primary limestone. Dr. Hutton's explorations among the granite veins in Glen Tilt, were among the chief means of establishing the Plutonic theory of geology. A. was once one of the best hunting districts in Scotland. Athole deer-forest is said to contain 100,000 acres, and 10,000 head of deer, of which 100 are killed annually. In the picturesque Pass of Killiecrankie, in this district, 17 miles north-west of Dunkeld, Claverhouse fell in 1689, though victorious over the trops of King William III.

A'THOR, or ATHYR, but properly, *Het-her*, i. e., 'the habitation of God,' the name of an Egyptian goddess who, in the mythological system of that people, is ranked among the second class of deities. She was the daughter of Ra, the sun. By the Greeks, she was identified with Aphrodite (Venus). The cow was regarded as her symbol, and, in hieroglyphics, she generally appears with the head of that animal, bearing between her horns the figure of the sun's disk. A. is also represented as a cow itself, and as a bird with human face, horns, and the sun's disk. On the oldest monuments, she is frequently portrayed bearing a temple on her head, as in the Athor-capitals of the Ptolemaic buildings, falsely supposed to be heads of Isis. Originally, the goddess had a cosmogonic significance; later, she was called the 'mistress of dance and jest,' and held in her hands, as symbols of joy, the cord of love and the tambourine. Queens and princesses were often represented by the figure of A. Her worship was generally spread through Egypt. Her most sacred abode was at Denderah. After her the third month of the Egyptian year was named.

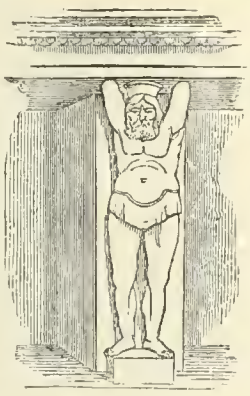
A'THOS, HA'GION O'ROS, or MO'NTÉ SA'NTO, i. e., the Holy Hill, the principal mountain of a chain extending, in a peninsular form, from the coast of Macedonia into the Ægean Sea, between the Gulfs of Contessa and Monté Santo, and connected with the mainland by a narrow isthmus. The length of the pen-

insula is 40 miles; breadth, 4. According to tradition, it received its name from A., son of Neptune, or from A., a giant who battled against the gods. The highest summit in the chain, or Mount A. proper, a solitary peak at the southern extremity of the peninsula, rises 6350 feet above the sea-level. In ancient times, several towns were built on A. Herodotus mentions five. The most memorable thing in connection with A., is the canal which Xerxes cut through the isthmus, in order to escape the stormy gales which rendered the navigatian round the promontory very perilous, and which had shattered the fleet of Mardonius some years before. Traces of this canal still exist. In the middle ages, A. was covered with monasteries, of which 20 still remain (besides several hermitages, chapels, &c.). The largest are the monasteries of Ivoron and St Laura; the richest, Vatopædi. The entire number of monks who inhabit the 'Holy Hill' is about 8000. They form a kind of monastic republic under the Turkish government, to which they pay an annual tribute of nearly £4000.

The monks follow the rule of Basilius, and lead an ascetic life, engaged chiefly in agriculture, gardening, and the care of bees. In diet, they restrict themselves to herbs, fruits, and fish. They carry on a considerable trade in amulets, images, crucifixes, wooden articles of furniture—all of their own manufacture—and also reap profits from the numerous visits of pilgrims. Karyæs, the principal place in the peninsula, is picturesquely situated in the midst of vineyards and gardens, and has 1000 inhabitants. Here the market is held; but no female, even of the animal kind, is permitted to be present, or even to enter the peninsula. In the middle ages, A. was the center of Greek learning and Christian-Byzantine art. Now, scarcely more than two or three monks, of tolerable education, can be found in a monastery. The libraries are neglected, though containing several beautiful old manuscripts, some specimens of which have been brought to Western Europe. They contain, however, little or nothing of value in classical literature.

ATHY′, a small town in the south-west of Kildare county, Ireland, on the E. side of the river Barrow, here joined by the Grand Canal. It lies in a carboniferous limestone district. It chiefly consists of 2 main streets. Pop. (1881) 4181. Its chief export is grain.

ATLA′NTA, a flourishing city of Georgia. It owes its prosperity chiefly to its situation, five important railways connecting here—the Atlanta and West Point, the Atlanta and Richmond, the Georgia, the Macon and Western, and the Atlantic and Western. Independently of these means of communication, the surrounding country, besides being rich in grain and cotton, contains gold, iron, and other valuable minerals. A. was destroyed by General Sherman, November, 1865, but is rapidly recovering its former prosperity. Pop. (1880) 37,421. See ATLANTA in AM. SUPP.



Atlas Column, from the Baths at Pompeii.

ATLA′NTES, in Arch., so called, by the Greeks, in reference to the mythical Atlas, (q. v.), are male figures used instead of columns. The Romans called them Telamones.

ATLA′NTIC OCEAN, so called either from Mount Atlas, or from the fabulous island of Atlantis, is that part of the ocean that divides the Old World from the New. Its extreme breadth is about 5000 miles, and its narrowest part, between Cape St. Roque in Brazil, and the nearest point in Africa, about 1600 miles. If the A. be supposed to be bounded by the polar circles, and to include the Caribbean Sea, Hudson Bay, Mediterranean Sea, and the other connected water-surfaces, it covers an area computed at 35 million square miles. The A. is naturally divided into three portions—the north, south, and intertropical A. It stands in open connection with the north and south polar seas, and in the remarkable parallelism of its coasts, resembles rather a vast river than an ocean. Its northern half sends off numerous ramifications on both sides, some of them forming almost shut seas: on the west, Hudson's Bay, the Gulf of St. Lawrence, and the Gulf of Mexico; on the east, the Baltic, North, Mediterranean, and Black Seas. In the south, again, both coasts present a comparatively unbroken line; and there is a remarkable correspondence between their projecting and retiring angles, the convex coast of Brazil lying opposite to the Gulf of Guinea, and the projection of Senegambia answering to the retirement of the American coast in the Caribbean Sea.

The whole of the New World, with the exception of the narrow strip lying west of the Andes and Rocky Mountains belongs to the *basin* of this ocean. It drains comparatively little of the Old World, as may be seen by tracing the water-shed on a map. Owing to the numerous seas and inlets connected with it, the extent of its shores is immense, over 50,000 miles, several thousands more than that of the shores of the Pacific and Indian Oceans. Except near the continents, the Atlantic is poor in islands compared with the Pacific. The chief islands in the open ocean are Iceland, Farö, Bermudas, Azores, Ascension, St. Helena, the Falkland Islands, South Georgia, and Sandwich Land.

The A. is the greatest highway of the civilized world, and everything that concerns its navigation is of great importance. Under the system of observations carried on for many years by the governments of Holland, Great Britain, the United States, and France, much has been done to amass information as to its currents, winds, depth, temperature, &c., the chief results of which either have been or are in the course of being published. The operations connected with the telegraph-cable were also the means of furnishing us with some valuable information regarding the Atlantic.

The chief A. currents are two. The *Equatorial Current*, which, starting from about the island of St. Thomas, in the Gulf of Guinea, with a rate of motion varying from 18 to 24 miles a day, proceeds westwards on both sides of the equator till near Cape San Roque, where it divides, one branch running south along the coast of Brazil, and the other along the coast of Guiana into the Caribbean Sea. The velocity of this current is 24 miles a day at the point where it curves south, whence it gradually diminishes in strength as it proceeds southward to little more than six miles a day. Within the South A. there is a complete circulation of the waters, induced by the prevailing winds, and maintained at about twelve miles a day Its force also varies with the months, being determined by the prevailing force of the wind of each month. Its breadth varies from 200 to 400 miles; and since it is fed by currents from north and south of it, its temperature is consequently considerably lower in the eastern than in the western part of its course. The other great current is the *Gulf Stream*. This, originally part of the equatorial current, after flowing past the Guiana coast, and through the Caribbean Sea, issues from the Gulf of Mexico, through the Strait of Florida, and after following the direction of the American coast to about 40°, turns seaward, touches the great Newfoundland Bank, and gradually curving round, is lost as a distinct current about the Azores (see GULF STREAM). The water of this stream is often upwards of 20° warmer than the surrounding ocean. The Gulf Stream has an immense influence on the Atlantic. Besides these great currents the A. abounds in smaller ones, such as the northerly currents along the East Greenland and Labrador coasts (this Arctic current extending as far south as 36° N. lat., its rate being from 24 to 10 miles a day); the southerly current along the west of Greenland; Rennel's current, west of the Bay of Biscay; and the great current along the west of Africa, from Morocco southwards, till it is merged in the Guinea current. The whole of these currents, follow in every case the prevailing winds of the regions where they flow.

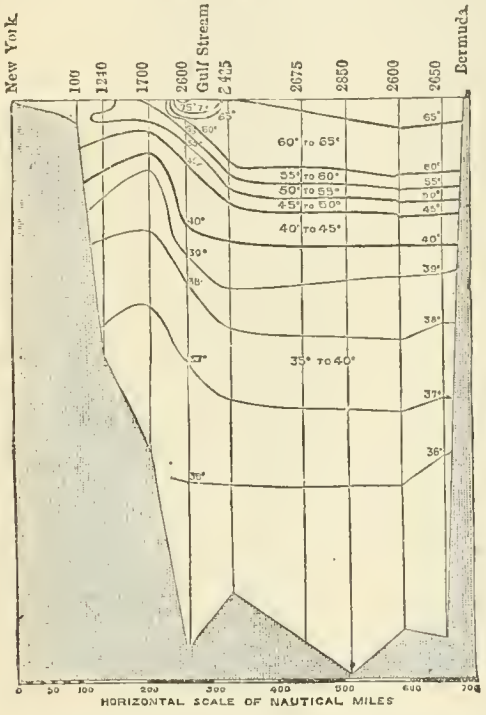
Since over the whole of the eastern half of the A., from about N. lat. 45° northwards, the prevailing winds are south-westerly, there is over the same region a general flow of the water of the ocean towards the north-east, passing the British Isles, and thence along the coast of Norway, to some distance east of the North Cape. It is to this circumstance that the mild temperatures of North-western Europe must be referred. The amelioration of the winter climates from this cause is very great, amounting to about 30° in the Hebrides, and to fully 40° in the Lofoden Islands. This effect is directly brought about, not by the winds alone, but by the influence of the winds and sea combined. The influence of currents on the temperature of the ocean is so great, that even in August, the isothermal of 50° touches the north of Norway in lat. 72° N., whereas to south-east of Newfoundland the same isothermal descends to about lat. 42° N. Again, on the meridian of 74° W., the change of temperature from lat. 40° to 35° N., or 300 miles, is 18°·0; whereas on the meridian of 20° W. from lat. 40° to 10°, a distance of 1800 miles, the change of the temperature of the sea is only 15°·0.

The temperature of the A. about the equator is, if we except the part between 20° and 35° W. long., above 80°: that of the Gulf of Guinea reaches the maximum of 85° in April; from October to May it is above 80°; in June and September about 80°; and in July and August it falls below 80°: that of the Caribbean Sea is above 80° from July to October, during the rest of the year below 80°, except in July. Between 10° and 30° lat. N., the temperature of the eastern part of the A. is always from 3° to 7° colder than the western, and the maximum and minimum temperatures take place later in the year in the Caribbean Sea than off the African coast.

Much has been done recently, particularly by H.M.'s ships *Porcupine* and *Challenger*, in throwing light on the physical geography of the A. The most important of the observations are those of deep and bottom temperatures, from their connection with oceanic circulation, and the distribution of life in the depths of the sea, and the bearings of the questions thereby raised on geological

speculation (see art. SEA). Animal life abounds at much greater depths than was formerly supposed; although beyond 6000 feet it gradually diminishes. A great part of the bottom of the North Atlantic is covered with a slimy 'ooze,' composed for the most part of the chalk-producing globigerina; in very deep parts this is replaced by a brown, clay-like mud, with few traces of animal forms.

Regarding the depth of the A., it is only recently that reliable data have been obtained; along certain tracts, especially those of the *Challenger*, the profile of the bottom can now be laid down with considerable certainty. The deepest sounding made by the *Challenger* with its improved method of sounding (see SOUNDINGS), is 3875 fathoms, or 23,250 feet, at a point about 90 miles off St. Thomas, West Indies. A remarkable ridge, about 400 miles wide, and 10,000 to 12,000 feet, or 2 to 2¼ miles, below the surface of the sea, extends along the bottom of the A. from Cape Clear in Ireland to Cape Race in Newfoundland, a distance of 1640 miles. Along this, which is known as the 'Telegraph Plateau,' the Atlantic cables are laid. The accompanying diagram exhibits the depths and temperatures in the track between New York and Bermuda:



Section of the North Atlantic Ocean between New York and Bermuda. Showing the Soundings (in fathoms) and Isothermal Lines obtained in H.M.S. *Challenger*, Captain G. S. Nares, 1873.

ATLANTIC TELEGRAPH. Referring to other articles for details concerning the scientific and mechanical principles of electro-telegraphy, the Atlantic cables may more especially be described here.

The possibility of laying an electric cable in the Atlantic, from Europe to America, was suggested by Professor Morse so far back as 1843; but it was not until 1854 that Mr. Cyrus Field and others discussed the means of practically realizing the idea. Lieutenant Maury discovered that the bed of the Atlantic, between Ireland and Newfoundland, forms a kind of plateau, covered with soft ooze, favorably situated as a resting-place for a cable. In 1855, negotiations were carried on, partly in America, but chiefly in England, to establish a company and raise capital; which objects were attained in 1856. The 'New York and Newfoundland Telegraph Company' connected Newfoundland with the mainland of America by cables and land wires; but the 'Electric Telegraph Company' undertook the laying of a cable from Newfoundland to Ireland, with a capital of £350,000, in shares of £1000 each. A length of 2500 English miles of cable was ordered, and was completed by the summer of 1857. The conductor consisted of 7 fine eepper wires, No. 22 gauge, twisted tightly together, forming a cord $\frac{1}{18}$th inch thick, and weighing 107 lbs. per mile. This thickness was increased to $\frac{3}{8}$th inch by a core of three layers of gutta-percha. Outside the core was a jacket of hempen yarn, saturated with pitch, tar, bees-wax, and boiled linseed oil. The outer sheath consisted of 18 strands, each formed of 7 No. 22 iron wires. The whole diameter was about $\frac{1}{10}$th inch, and the weight 1 ton per mile. In the manufacturing processes, the wires and yarns were twisted round each other by revolving drums and circular tables worked by steam-power; while the coatings of gutta-percha were applied by forcing the substance through dies which had the copper conductor passing through their center. The *Niagara* and the *Agamemnon*, the one lent by the United States government and the other by the English, took 1250 miles of the cable each, and steamed forth from Valentia (west coast of Ireland) on August 7, 1857. The *Niagara* paid out her portion of cable as she went. On the 11th, in an attempt to slacken the rate of paying out, the cable snapped, and the end sank in 2000 fathoms of water, at 280 miles from Ireland. The appliances on board were not sufficient to remedy the disaster, and the two ships returned to Plymouth, where the two portions of cable were placed in tanks until the next following year.

The Atlantic Telegraph Company raised more capital, made 900 miles additional cable, and prepared for a new attempt in 1858. The *Niagara* and *Agamemnon* were again employed; but the submersion was to begin in mid-ocean, one ship proceeding eastward, and the other westward, after splicing the two halves of the cable. They left Valentia, June 10; but it was not till the 26th that they could finish the splice and commence the submersion. On the 29th, a double breakage took place, and 144 miles of cable went to the bottom, wholly severed from the rest. The *Agamemnon* returned to England for improved appliances and further instructions; and a month was thus lost. On July 29, the two ships again spliced their two halves of cable in mid-ocean, and proceeded with their work without further disaster. On August 6, the *Agamemnon* reached Valentia, and the *Niagara* Newfoundland, and exchanged congratulatory messages through the whole length of cable. Soon afterwards, greetings were exchanged between the Queen and the President, and between many public bodies and official persons. The station at Newfoundland was connected by wires and cables with the general telegraphic system of America; and that at Valentia with the general system of Europe. The cable continued working until September 1, sending 129 messages (of about 11 words each on an average) from England to America, and 271 from America to England. The signals then ceased, and the cable became useless; it had been injured by the winter's sojourn at Plymouth.

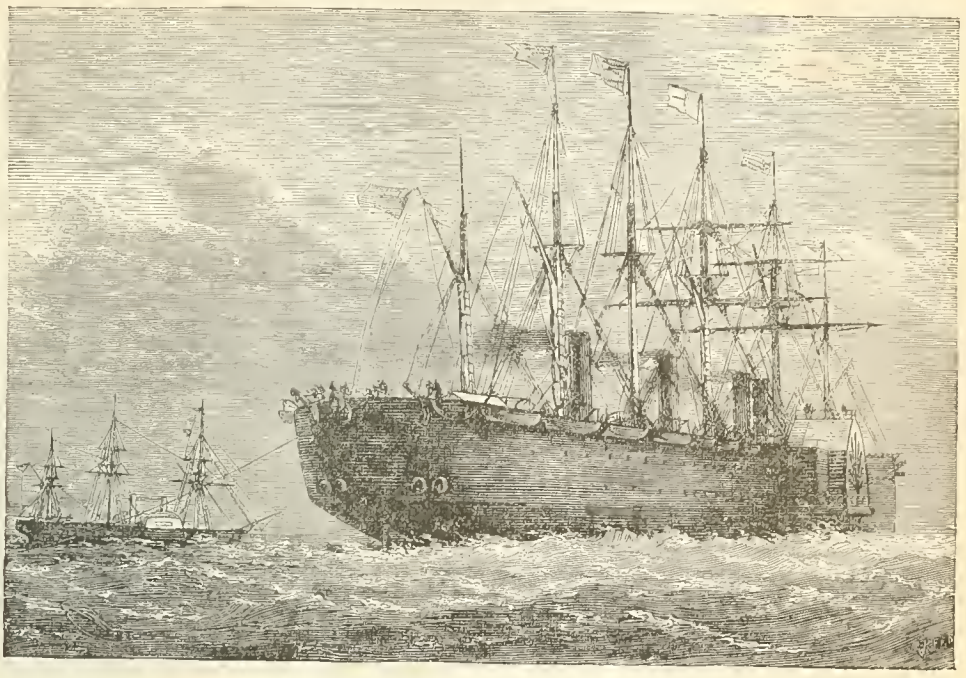
From 1858 to 1864, the Company were engaged in endeavoring to raise new capital, and to obtain increased subsidies from the English and American governments; while scientific men were making improvements in the form of cable, and in the apparatus for submerging it. At length the Telegraph Construction and Maintenance Company (formed by an amalgamation of the Gutta Percha Company with the wire-cable-making firm of Glass and Elliott) made an entirely new cable, much thicker and more costly than the former one. The conductor, 306 lbs. per mile, and $\frac{1}{4}$th inch thick, consisted of seven No. 18 copper wires, each $\frac{1}{20}$th inch thick. The core was formed of four layers of gutta percha alternating with four of Chatterton's Compound (a solution of gutta percha in Stockholm tar); the core and conductor together were 700 lbs. per mile, and $\frac{9}{20}$th inch thick. Outside this was a jacket of hemp or jute yarn, saturated with preservative composition. The sheath consisted of 10 iron wires, No. 13 gauge, each previously covered with 5 tarred Manilla yarns. The whole cable was $1\frac{1}{4}$th inch thick, and weighed 35¾ cwt. per mile, with a breaking strain of 7¾ tons.

As the cable (2300 miles) weighed more than 4000 tons, it was resolved to employ the *Great Eastern* steam-ship to carry it out and lay it. Three enormous iron tanks were built in the fore, middle, and aft holds, from 50 to 60 feet diameter each, by 20½ feet deep; and in these the cables were deposited, in three vast coils. On July 23, 1865, the *Great Eastern* started from Valentia with her burden, the main cable being joined end to end to a more massive shore cable, which was drawn up the cliff at Foilhummerum Bay, to a telegraph house at the top. The electric condition of the cable was kept constantly under test during the progress of the ship; and more than once, the efficiency was disturbed by fragments of wire piercing the gutta percha and destroying the insulation. On August 2, the cable snapped by over-straining, and the end sank to the bottom, in 2000 fathoms water, at a distance of 1064 miles from Ireland. Then commenced the remarkable process of dredging for the cable. A five-armed grapnel, suspended from the end of a strong iron-wire rope, five miles long, was thrown overboard; and when it reached the bottom, it was dragged to and fro across the line of cable by slow steaming of the *Great Eastern;* the hope being that one or other of the prongs would catch hold of the cable. A series of disasters followed by the breaking of swivels, and the loss of grapnels and ropes; until at length, on August 11, it was found that there were no more materials on board to renew the grappling. The *Great Eastern* returned to England, leaving (including the operations of 1857—1858) nearly 4000 tons of electric cable useless at the bottom of the Atlantic.

A new capital, and new commercial arrangements altogether, were needful for a renewal of the attempt. Another cable was made, slightly differing from the former. The jacket outside the core was made of hemp instead of jute; the iron wires of the

sheath were galvanized, instead of being left in their natural state; and the Manilla hemp which covered them was left white instead of being tarred. These few changes made it weigh nearly 500 lbs. per mile less, mainly through the absence of tar; while its strength or breaking strain was increased. Enough of this cable was made to span the Atlantic, with allowance for slack; while a sufficient addition of the 1865 cable was provided to remedy the disaster of that year.

The Atlantic telegraph operations in 1866 were of a remarkable and interesting kind. On July 13, the *Great Eastern* set forth from Valentia, accompanied by the steamers *Terrible*, *Medway*, and *Albany*, which were to assist in the submersion and in subsidiary matters. The line of route was chosen midway between those of the 1858 and 1865 cables, for the most part a few miles from each. The *Great Eastern* exchanged telegrams almost continuously with Valentia during her progress. The mishaps were few in number, and easily remedied; and the *Great Eastern* safely entered the harbor of Heart's Content, Newfoundland, on the 27th. After this, operations commenced for recovering the end of the 1865 cable, and completing the submersion. The *Albany*, *Medway*, and *Terrible* set off, on August 1, to the spot on the ocean beneath which the end of the cable was lying, or as near to it as calculations could establish. Certain buoys, left anchored there twelve months previously, had been carried away by the storms of the preceding winter; but the latitude and longitude had been very carefully registered. The *Great Eastern* started from Heart's Content on the 9th, and then commenced a series of grappling operations, which continued through the rest of the month. The cable was repeatedly caught, and raised to a greater or less height from the ocean-bed; but something or other snapped or slipped every time. After much trial of patience, the end of the cable was safely fished up on September 1; and electric messages were at once sent through to Valentia, just as well as if the cable had not had twelve months' soaking in the Atlantic. An additional length having been spliced to it, the laying recommenced; and on the 8th the squadron entered Heart's Content; having thus succeeded in laying a second line of cable from Ireland to America.



Great Eastern paying out the Atlantic Cable.

Mishaps have since taken place; but in every case the injuries have been attended to, and the two cables maintained in good working order. The rapidity of signalling (at first only two words per minute) was greatly increased; the tariff of charges was lowered; the public of the two nations used the cable-telegraph extensively; and the company realized good dividends, notwithstanding the heavy expenditure which had been incurred.

The art of laying submarine cables being thus established, many other projects for Atlantic telegraphy have from time to time been started. One scheme was for a line from the North of Scotland to Faröe Islands, Iceland, Greenland, and some point near the mouth of the St. Lawrence; but the projectors did not succeed in raising capital. A French company afterwards planned a direct route from France to America. In June 1869, the *Great Eastern* steamed out of Brest with this new cable, no less than 2328 miles long; and the submersion was successfully effected. There is a connection between Brest and Falmouth. A new French cable from Brest to the island of St. Pierre, to the south of Newfoundland, was laid in the end of 1879. In the year 1874, a third British cable was successfully laid from Ireland to Newfoundland. A 'Direct United States Cable Company' was also formed; Messrs. Siemens undertook the manufacture of the cable, the lightest yet planned for Atlantic telegraphy, its weight being 480 pounds of copper and 400 pounds of gutta-percha per mile; about 3060 miles were needed from Ireland to New Hampshire. The laying of the cable was completed early in the summer of 1875.

Lower down the Atlantic, extensive operations have been or are being completed. When a cable had been laid from Falmouth to Lisbon, the latter became the starting-point for extensive ocean routes. The 'Brazilian Submarine Cable Company' began in 1873 a cable to extend from Lisbon to Madeira, St. Vincent, and Pernambuco. The whole length is 4000 miles, of which the longest section (across the ocean) is somewhat under 2000 miles; it is connected at Pernambuco with other cables to Para, Rio Grande, &c.

There is a 'Direct Spanish Cable' from the Lizard to Bilbao; and there are duplicate lines from Falmouth to Lisbon. In and near the Gulf of Mexico, the electricians have been working with great energy. Most of the principal West India islands are now connected by cable one with another, with Colon (Panama), and with the United States mainland at Florida.

ATLA'NTIC TE'LEGRAPH, History of. In 1842, Professor Morse of New York, having stretched a submarine cable between Castle Garden and Governor's Island, Boston, and succeeded in transmitting an electric current from one end to the other, expressed his opinion that it would be possible to effect an electrical communication through the sea. After further investigations, he announced to the Secretary of the Treasury of the United States, 'that a telegraphic communication on his plan might with certainty be established across the Atlantic.'

Three years prior to that, Sir William O'Shaughnessy gave practical proof that electrical messages could be conveyed through water, by depositing a cable in the bed of the Hooghly; but it was the successful submarine telegraphic undertakings of the Messrs. Brett, who, in June 1845, registered a 'General Oceanic Telegraph Company,' with the object among others of joining this country with America by means of a telegraph 'across the Atlantic Ocean,' and six years afterwards united England with France (see Telegraph, *History*), that first fairly convinced the public mind that the New World might be put on what may be called conversational terms with the Old. The supposed great depths of the Atlantic Ocean presented the most imposing obstacle to this desired closeness of communion; but when it was discovered that between Ireland and Newfoundland there extended, along the bottom of the Atlantic, at a depth of not more than two miles below the surface, a fine broad platform (see Atlantic Ocean), seemingly so specially formed by nature for the purpose of electrical communication, that Captain Maury at once designated it the Telegraphic Plateau, the project of an Atlantic submarine cable assumed a practicable form. In 1854, the colonial government of Newfoundland passed an act incorporating a company to establish a telegraphic communication between the Old World and the New, and aided it by a subsidy, and by grants of lands. The colonial government also conferred upon the company the exclusive right of landing a telegraphic line upon the coast under its jurisdiction. The government of Prince Edward's Island and the state of Maine made similar concessions; and authority for certain subsidiary operations in Canada was also obtained. The company, incorporated under the title of 'The New York, Newfoundland, and London Telegraph Company,' commenced operations by uniting St. John's in Newfoundland with lines in the United States and British North America. This done, numerous preliminary experiments were undertaken by eminent electricians and engineers, in order to determine the amount of retarding force which inducted and disguised electricity were likely to offer to the transmission of currents along submarine wires of unusual length. Having by these experiments, 2000 in number, tried with 62 different kinds of cable, determined the one best adapted

for the conveyance of electricity through such a length, and at such a depth in the Atlantfc, the next step was the formation of a more influential company. In 1856, 'The A. T. Company,' to which all the privileges conferred on the old company were handed over, was formed with a capital of £350,000. The governments of Great Britain and the United States liberally aided the company, guaranteeing, by a contract of 25 years' duration, to pay to the company, until such time as its dividend reached 6 per cent., a subsidy of £14,000 a year, and of £10,000 subsequently. They also agreed to furnish ships for laying down the cable.

The cable, which weighed about a ton per mile, equal to 14 cwt. in water, was composed of a strand of seven wires of pure copper, coated with three separate layers of gutta percha, wrapped over with hemp saturated with pitch and tar, and finally bound round with iron wires, 332,500 miles of iron and copper wire being employed in its construction. It was deposited in the holds of the *Agamemnon*, a line-of-battle ship supplied by the British government, and the *Niagara*, a splendid frigate furnished by the United States, and the two vessels started on their grand mission. After two unsuccessful attempts during the years 1857 and 1858, the expedition started again for mid-ocean, whence the ships were to start, paying-out towards opposite shores, on the 17th of July, 1858. The cable was united and lowered on the 29th of the same month; and the *Agamemnon*, notwithstanding a severe gale of wind, arrived at Valentia, having successfully laid her portion of it, on the morning of the 5th of August. The *Niagara* about the same time arrived in Trinity Bay, Newfoundland, and science had annihilated space between the Old World and the New. On the 17th August, the extremities of the cable having been put in connection with the recording-instruments, the following message was flashed through the ocean in thirty-five minutes: 'Europe and America are united by telegraph. Glory to God in the highest; on earth peace and good-will towards men.' Messages and replies from the Queen to the President of the United States, from the Mayor of London to the Mayor of New York, &c., followed. But on the 4th of September, the signals at Valentia became unintelligible. One commercial message of great importance passed through the cable, in reference to the collision between the Atlantic steamers, the *Europa* and *Arabia;* this single message saved the commercial world £50,000, which would doubtless have been spent in extra insurance on the vessels and cargoes thus delayed. The cable of 1858 having become useless, two other lines were laid in 1865 and 1866, between Great Britain and North America. A cable was laid in 1869 from France to the United States. For the history of the Atlantic Telegraph since 1869, see ATLANTIC TELEGRAPH. See also TELEGRAPH.

ATLAN'TIS, according to ancient tradition, the name of a vast island in the Atlantic Ocean. It is first mentioned by Plato, who represents an Egyptian priest as describing it to Solon, but, of course, according to Plato's view of the matter. In this description, A. appeared as an island larger than Libya and Asia Minor taken together, and lying off the Pillars of Hercules in the Atlantic Ocean. Plato gives a beautiful picture of the interior of this imaginary land, and enriches it with a fabulous history. Some early writers supposed that the Canary Islands were the remains of the old A.; for Plato had stated that at the close of the long contest which its inhabitants maintained against the Athenians, nine thousand years before his time, the sea suddenly engulfed the island, and had ever since been unnavigable, by reason of the shoals of mud created by the sunken island. Some found it in the Scandinavian peninsula; others (first Bircherod in 1685) have supposed that Phœnician or Carthaginian merchant-ships had been driven by storm on the coast of America, and that the supposed vast island of A. mentioned by Plato, as well as the great unnamed island spoken of by Pliny, Diodorus, and Arnobius, may have been the New World.

ATLAS is that piece of the human vertebral column which is nearest to the skull; in other words, it is the first cervical vertebra. It may be known from the other six by its being without a body or spinnous process, by its being a mere irregular bony ring, partly divided into two unequal parts by a constriction; this division in the recent subject is completed by a ligament, the part in front being occupied by the tooth-like process of the second cervical vertebra, and that behind by the spinal-marrow. On each side, the ring is very thick; it is smooth and cupped above to receive the condyles of the occipital bone. The corresponding parts below are flat, and rest on the second cervical vertebra.

The A., with the occipital bone, form the joint on which the head moves in bowing; and turns on the pivot of the second cervical vertebra, when we look from side to side.

ATLAS, according to Hesiod's *Theogony*, one of the Titans, the son of Iapetus and Clymene, and brother of Menœtius, Prometheus and Epimetheus. Apollodorus, however, states him to have been a son of Asia, and Hyginus, a son of Æther and Gaea. He married Pleone, daughter of Oceanus (or Hesperis, his own niece), and became the father of the Pleiades. As leader of the Titans, he attempted to storm the heavens, and for this supreme treason was condemned by Zeus to bear the vault of heaven on his head and hands—the sting of this mythological punishment obviously being, that A. was compelled to support what he thirsted to destroy. The later writers, however, rationalize the myth, and state that A. was a mighty king who had great skill in astronomy, and only tried to storm heaven intellectually.—In consequence of the ancient views which made the vault of heaven rest on solid pillars or other supports, the name A., originally mythological and cosmogonic, was introduced into geography. Mercator, in the 16th c., gave the name A. to a collection of maps; probably because the figure of A. supporting the heavens had been given on the title-pages of such works.

A'TLAS, a mass of mountain-land in the western part of North Africa. Herodotus mentions a smoking mountain of this name situated on the south-west of the Little Syrtis, and twenty days journey westwards from the Garamantes, styled by the natives the 'pillars of heaven.' By later writers, after the time of Polybius, the name A. was always given to the chain of mountains in North-west Africa extending from the island of Cerne (now Cape de Ger) north-west through Mauritania, and Tingitana (now Fez and Marocco), and including also the heights dispersed through the region of Sahara. It is divided into the Little Atlas and the Great Atlas; the former denominating a secondary range in the country of Sous, and the other, the loftier mountains of Marocco. The A. is not properly a mountain-chain, but rather a very irregular mountainous mass of land formed of many chains running in various directions, meeting in mountain-knots, or connected by yokes, or short chains of inferior height, and diversified still further by several solitary mountains and groups of mountains. The A. attains its greatest height (13,000 feet) in Marocco, the only part where it rises above the snow-line, and obtains the name of Jebel-el-Thelj, or Snowy Mountains. Its highest peaks are Miltsin—27 miles south-east of the city of Marocco—Bibawan, and Tagherain. The most southern chain diverging here from the central mass bears the name *Jebel-Hadnar*. The heights approach the sea, and form the promontories jutting out into the Atlantic. From Marocco, the A. gradually decreases in height towards the east. In Algeria, the elevation is only 7673 feet; in Tunis, 4476 feet; and in Tripoli, 3200 feet. The whole mountain-system is intersected by the valley of the Muluia river, which flows through the north-east part of Marocco, and falls into the Mediterranean. The slopes on the north, west, and south are covered with vast forests of pine, oak, cork, white poplar, wild olive, &c. The valleys are well watered and capable of cultivation with great profit. The A. seems to be chiefly calcareous in its composition. The mineral wealth remains, however, almost wholly unexplored, though copper, iron, lead, antimony, &c., are stated to exist in abundance.

A'TMOSPHERE (Gr. *atmos*, vapor, *sphaira*, sphere) is the name applied to the gaseous envelope which surrounds the earth. The existence of an A. is to us a matter of vital importance. We owe to its influence the possibility of animal and vegetable life, the modifying and retaining of solar heat, the transmission of sound, the gradual shading of day into night, the disintegration of rocks, and the occurrence of weather phenomena. In consequence of the action of gravity, the A. assumes the form of a spheroidal stratum concentric with the earth, and presses heavily on its surface. It exhibits, in common with all fluid bodies, the usual characteristics of hydrostatic pressure, but its internal condition differs from that of a liquid inasmuch as its particles repel each other, and can only be held in proximity by external force. From this circumstance, it follows that the volume of any portion of air varies much more under the influence of external pressure than that of an equal volume of water, hence, the stratum of air nearest the earth is denser than strata in the upper regions, where, from their being subjected to the weight of a smaller mass of superincumbent air, the repulsive force of the particles has freer play.

That air possesses *weight*, is illustrated by the following simple experiment. If a hollow glass globe of 5 or 6 inches in diameter be weighed first, when filled with air, and then, after the air has been extracted from it by means of the air-pump, it will, when thus exhausted, weigh sensibly less than it did before, and the difference of the two results will represent the weight of the quantity of air which has been withdrawn. It has been determined by Biot and Arago that 100 cubic inches of dry air, when the barometer is at 30 inches, and the thermometer at 60° Fahrenheit, weigh 31·074 grains. The law of Archimedes (see ARCHIMEDES, PRINCIPLE OF), that a body immersed in a fluid loses a part of its weight equal to the weight of the volume of fluid displaced by it, finds its application in the A. as well as in water. If a glass globe filled with air and closed be suspended at the extremity of the beam of a delicate balance, and be kept in equilibrium by a brass weight at the other extremity, and if the whole be then placed under the receiver of an air-pump, and the air extracted, the equilibrium previously existing in air will be disturbed, and the larger body will become the heavier. The reason of this is, that when first weighed,

they each lose as much of their own weight as that of the respective volumes of air displaced by them, and are therefore made buoyant, though in different degrees, the ball with the larger volume having the greater buoyancy. In a vacuum, they are deprived of this buoyancy, and the larger body, suffering the greater loss, becomes sensibly heavier than the other. In like manner, a balloon filled with heated air or hydrogen gas is lighter than the volume of air displaced by it. It is therefore forced upwards till it reaches a stratum of such density that the weight of the volume of air there displaced by it equals the weight of the balloon itself. In this stratum it will remain poised, or move horizontally with the currents to which it may be exposed.

In endeavoring to determine the *form* of the atmospheric envelope, it is necessary to bear in mind that, according to the law of fluid-pressure, in order to produce a state of equilibrium at the level of the sea, the pressure of the A. must be equal at that level over the whole of the earth's surface. Gravity acts with less force on the air at the equator than on that at the poles, in consequence of the spheroidal form of the earth. It has there, in addition, to contend with the centrifugal force, which entirely fails at the poles, and which has a tendency to lighten the air by acting contrary to that of gravity. Hence we infer, that in order to produce the same pressure at the level of the sea, the atmospheric height at the equator must be greater than that at the poles, and that the A. must therefore possess the form of an oblate spheroid, whose oblateness is considerably greater than that of the earth itself. The greater heat at the tropical regions must also have the effect of increasing the oblateness.

The *height* of the A. has not yet been determined. That it must have a certain limit, is evident from the consideration that there must be a point at which gravity on the one hand, and centrifugal force and the repulsive action of the particles on the other, are poised, and beyond which the latter forces on balancing the former force, the aërial particles would be borne away from the earth. As, however, the law of the diminution of temperature, which materially affects the repulsive action, is unknown for the upper regions of the air, it is impossible to calculate the height of the atmosphere from the relations of these forces. From the observation of luminous meteors, it is inferred that it is at least 100 miles high, and that, in an extremely attenuated form, it may even reach 200 miles.

The *pressure* of the A. is one of its most important properties. Its effect is exhibited in the action of the ordinary water-pump. The piston is fitted air-tight in its cylinder; and on being drawn up, creates a vacuum. The water within the pump being thus freed from pressure, while that outside of it is exposed to the pressure of a column of air reaching to the surface of the A., is at once forced up by reason of the weight of air which it must rise to balance. The ascent of the water takes place till the piston has reached the height of nearly 34 feet, from which we conclude that a column of air is equal in weight to a column of water of the same horizontal section, and of the height of nearly 34 feet. As mercury is 13·6 times heavier than water, a mercurial column freed from atmospheric pressure at the one extremity, and subjected to it at the other, is 13·6 times less in height than the column of water, or about 30 inches. From the more convenient size of this column, mercury has been adopted as the standard for atmospheric pressure, and is employed in our ordinary barometers (q. v.). A mercurial column of 30 inches in height, and 1 square inch in section, weighs 15 lbs. (more accurately, 14·73), which gives us the equivalent weight of a column of atmospheric air of the same section. The word *A.* is often employed to express this weight or pressure on a square inch of surface, so that when we speak, in Mechanics, of the pressure of steam on a boiler as amounting to three atmospheres, we mean a pressure of 45 lbs. on the square inch. The pressure on a square inch being thus ascertained, we have merely to multiply it by the number of square inches on the earth's surface to obtain the total weight of the A. It amounts to 11·67085 trillions of lbs., or about $\frac{1}{1800000}$ of the earth's mass.

It must be observed that the height of the barometric column is not a constant quantity, as it varies with the latitude, the season of the year, and the hour of the day. At London its mean height is 29·88 inches; at Paris, 29·92 inches. The pressure of the A. in the northern hemisphere increases as we recede from the equator, reaching a maximum at 30° N. lat., and decreasing from 30° to 65°, where it again begins to rise. The greater height at 30°, is said to be due to the accumulation of air at that latitude by the action of the trade-winds. As the heat of the earth's surface increases the rarity of the air above it, and causes the air at the top of the heated column to overflow, we would expect that, during the year, the barometer would stand at a minimum in summer, and a maximum in winter. In reality, however, although the barometer is highest in midwinter, there is another maximum in mid-summer, making thus two minima—one in spring, the other in autumn. This arises from the part which watery vapor plays in the pressure of the atmosphere. The heat of mid-summer introduces into the air a large quantity of moisture, in the form of elastic vapor, which, adding its pressure to that of the dry air, raises what would otherwise be the minimum barometric column to a higher point than that at which it stands in spring and autumn. Similar causes affect the pressure of the A. during the 24 hours of the day. There are two maxima—one at 10 A.M., the other between 10 and 11 P.M.; and two minima—at 4 A.M. and 4 P.M. Very slight variations indicate the existence of atmospheric tidal waves; but this subject is still involved in some obscurity. The pressure of the A. exercises a most important influence on the organism of the human frame. A man of ordinary stature is exposed to a pressure of about 14 tons; but as the air permeates the whole body, and presses equally in all directions, no inconvenience is found to result from it. From experiments instituted by the brothers Weber in Germany, it has been ascertained that the heads of the thigh and arm bones are kept in their sockets by the pressure of the A; and in balloon ascents the aëronaut often suffers from bleeding at the nose, lips, and even eyes—a fact that would seem to indicate that the strength of the blood-vessels has been adjusted with reference to atmospheric pressure.

Chemical Composition of the A.—Recent chemical researches give the following as the mean composition of 100 volumes and of 100 grains of dry air:

	Volumes.	Grains.
Nitrogen	79·02	76·84
Oxygen	20·94	23·10
Carbonic acid	0·04	0·06
	100·00	100·00

Besides the substances just named, other gaseous matters occur, but in quantities so small as not sensibly to increase the bulk of the A., such as ammonia and ammoniacal salts, carburetted and sulphuretted hydrogen, carbonic oxide, sulphurous and sulphuric acid, nitric acid, and perhaps iodine, the quantity and even the presence of which are affected by local and meteorological causes. Roughly speaking, then, dry air may be said to consist of 4 volumes of nitrogen and 1 of oxygen, with a slight admixture of carbonic acid, and a mere trace of several other substances. As, however, the air of the A. is never found dry, we must add to the constituents already named watery vapor, the amount of which is constantly changing, according to locality, weather, wind, and temperature. It is stated that of 1000 grains of atmospheric air, the proportion due to aqueous vapor varies from a minimum of 4 to a maximum of 16 grains. By far the most active chemical constituent of the A. is oxygen, to the agency of which are owing the existence of animal life, the maintenance of combustion, the rusting of metals, and the occurrence of several other chemical phenomena too numerous to be detailed. A small portion of this oxygen occurs in the form of ozone (q. v.), a modification which, according to recent chemical discoveries, plays an important part in the chemistry of the A. The nitrogen which forms the bulk of the A. possesses few chemical properties of importance, but performs the important part of diluting the oxygen, which, if it occurred alone, would act with too great intensity. The presence of carbonic acid in the air is shown by the production of the white carbonate of lime in lime-water freely exposed to its influence. Carbonic acid is produced in all processes where carbonaceous matter unites itself with the oxygen of the air, such as in animal respiration, in combustion, in fermentation, in putrefaction, and similar processes. The green leaves of plants, on the other hand, possess, in presence of sunshine, the power of decomposing carbonic acid into its elements, absorbing the carbon for their own tissues, and restoring the oxygen to the A. in its original purity. Between the processes above mentioned, on the one hand, and the action of plants on the other, the quantity of carbonic acid in the air is kept nearly constant. From the table it will be seen that 10,000 volumes of atmospheric air contain 4 volumes of carbonic acid. If it occurred in a much larger proportion, being poisonous, it would become dangerous to animal life; and if it occurred in a much less proportion, the vegetable world would lack its requisite nourishment. The other substances, of which a trace is always or only sometimes found in atmospheric air, are difficult to detect in the air itself, but are generally found dissolved in rain-water, more especially in that which has fallen immediately after a long drought.

Of these, by far the most important and widely diffused are ammonia and ammoniacal salts, which are of essential importance to the vegetable economy, because, dissolved in the rain, they furnish plants with the nitrogen required by them for the production of their flowers and fruit. Nitric acid is detected in the air after thunder-storms, sulphuretted hydrogen in the tainted air of sewers and such like places, and sulphurous and sulphuric acid only in the neighborhood of chemical or smelting works. A considerable quantity of carbonic oxide and carburetted hydrogen escapes unconsumed from our furnaces; and although the latter gas is in addition given off to the air in marshy and bituminous dis-

tricts, the two occur in almost inappreciable quantity in the atmosphere.
